# **COMPLETE INTEROPERABILITY IN HEALTHCARE**

## **Technical, Semantic and Process Interoperability through Ontology Mapping and Distributed Enterprise Integration Techniques**

A thesis submitted in fulfilment of  
the requirements for the award of the degree

**DOCTOR OF PHILOSOPHY**

from

**UNIVERSITY OF WOLLONGONG**

by

**AMANDA JOANNE DUCROU**

BE (software), MDigMMedia (distinction)

**FACULTY OF INFORMATICS**

**2009**

## **Certification**

I, Amanda J. Ducrou, declare that this thesis, submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the Faculty of Informatics, University of Wollongong, is wholly my own work unless otherwise referenced or acknowledged. This document has not been submitted for qualifications at any other academic institution.

Amanda J. Ducrou  
25th May, 2009

## **Acknowledgements**

I would like to acknowledge my supervisor, Peter Eklund, for giving me the opportunity to attain a PhD and for his ongoing supervision. Peter always trusts me to complete any task he gives me without constantly checking up on me, but is always available for a discussion if needed. Peter has given me some great advice over the years, for which I thank him.

I would like to take this opportunity to thank Pen Computer Systems, and chiefly managing director John Johnston for his guidance in the field of Health Informatics and for supporting my work. I would also like to thank Tarkhan Shahho for helping on the technical side of the *e*POC project, and Brett Esler for introducing me to HL7 Version 3 and being available for endless discussions on how to represent clinical constructs.

Also in conjunction with the *e*POC project, I would like to thank my colleague Jason Sargent for all his hard work in that area, and also Damian Ryan and the rest of the TACT staff for their support for the *e*POC field trial and for their consultations on clinical knowledge employed in that project.

My parents, Jeff and Janelle Ryan, have always believed in me beyond all reason and I am just glad to make them proud. Thanks, Mum and Dad, for always being supportive.

Last but not least, I thank my husband, Jon, for all his support, advice and proof-reading which has helped me to finally complete this thesis. Thank you for always having faith in me.

# Abstract

Interoperability in healthcare is a requirement for effective communication between entities, to ensure timely access to up-to-date patient information and medical knowledge, and thus consistent patient care. This thesis focuses on the development of an interoperability solution for health by employing design science research methods to arrive at a final solution.

First, background topics including Health Informatics standards and formats are covered, which leads to three major Health Informatics standards being used throughout the remainder of this work – HL7 for messaging, *openEHR* for patient records, and SNOMED CT as a standard terminology to facilitate clarity of information, and to discourage ambiguity between communicating entities.

Ontology mapping methods between these standards designed to promote interoperability by using the standards in conjunction with each other are then presented, leading to a solution for semantic interoperability.

A technical interoperability solution is required for sending these semantically interoperable messages, which leads to the development of a framework which uses a tuple-space paradigm to share messages. This framework is shown to have some scalability issues, which leads to the final solution – a scalable interoperability framework based on the Enterprise Service Bus methodology of enterprise integration which provides a real-world answer to communication in healthcare.
