ABSTRACT

A series of multi-target directed edaravone derivatives bearing *N*-benzyl pyridinium moieties were designed and synthesised. Edaravone is a potent antioxidant with significant neuroprotective effects and *N*-benzyl pyridinium has previously exhibited positive results as part of a dual-site binding, peripheral anionic site (PAS) and catalytic anionic site (CAS), acetylcholinesterase (AChE) inhibitor. The designed edaravone-*N*-benzyl pyridinium hybrid compounds were docked within the AChE active site. The results indicated interactions with conserved amino acids (Trp279 in PAS and Trp84 in CAS), suggesting good dual-site inhibitory activity. Significant *in vitro* AChE inhibitory activities were observed for selected compounds (IC₅₀: 1.2–4.6 μM) with limited butyrylcholinesterase inhibitory activity (IC₅₀'s >160 μM), indicating excellent selectivity towards AChE (SI: 46 – >278). The compounds also showed considerable antioxidant ability, similar to edaravone. *In silico* studies indicated that these compounds should cross the blood–brain barrier, making them promising lead molecules in the development of anti-Alzheimer's agents.

1. Introduction

Alzheimer's disease (AD) is a progressive neurodegenerative disorder that is mainly prevalent in the older population (>65 years of age)^{1–3}. Approximately fifty million people are diagnosed with dementia, with AD accounting for 60–70% of these cases⁴. The disease can be characterised by an array of symptoms which include; memory loss, cognitive impairment, behavioural and psychiatric abnormalities³. Due to the complex and multifactorial nature of AD, the exact aetiology of the disease is unknown. Multiple pathways and hypotheses have been indicated in the pathology of the disease such as the Aβ cascade-, cholinergic- and the oxidative stress hypotheses^{1,3,5}.

Senile plaques are considered a pathological hallmark of AD. The primary constituent of these senile plaques is Aβ and are believed to play a central role in the pathogenesis of the disease^{6,7}. The amyloid cascade hypothesis suggests that one of the main driving forces behind AD development is the buildup and deposition of Aβ peptide aggregation within the brain^{8,9}. Recently, it was discovered that the amyloid precursor protein (APP) gene undergoes mutations that induce an increase in Aβ formation. The APP mutations are situated near the sites where proteases, β and γ-secretase, cleave the APP. These mutations result in the favouring of the Aβ_{1–40} and Aβ_{1–42} peptide fragment formation^{7,8,10}. Aβ_{1–40} and Aβ_{1–42} are more inclined to self-aggregate to form amyloid beta fibrils. With the persistent imbalance of the production and clearance of the Aβ fragments, the consequential result is the genesis of insoluble senile plaques. These senile plaques result in the blockage of parenchymal spaces between neurons in the brain leading to eventual neuronal cell death^{8,9}.

The cholinergic hypothesis describes that the hydrolysis of the neurotransmitter acetylcholine (ACh) by cholinesterases, acetylcholinesterase (AChE) and butyrylcholinesterase (BuChE), leads to a drastic decrease in ACh levels. The loss of cholinergic transmission due to the decreased levels of ACh has been correlated with loss of memory and cognitive ability¹¹. AChE is the predominant enzyme that hydrolyse ACh in the healthy brain¹². The AChE enzyme contains a pocket with two binding sites, the catalytic anionic site (CAS) and peripheral anionic site (PAS). Interactions with both these sites are crucial for the inhibition of AChE activity and potential neuroprotective effects¹³. The PAS possesses a non-cholinergic role that through protein–protein interactions, bind to and promotes the formation and deposition of insoluble Aβ fibrils leading to neurotoxicity. Recent studies have shown that the inhibition in the PAS did not only improve the memory in a transgenic APP/PS1 murine model, but also significantly stemmed the amount of Aβ plaques in the brain^{14–16}.

Reactive oxygen species (ROS) are known to play a significant role in the progression of neurodegenerative disorders such as AD^{17–19}. The most significant ROS include hydroxyl radicals, superoxide anions and peroxyl radicals¹⁹. As ROS begins to accumulate and antioxidant levels begin to reduce, detrimental effects in the brain begin to occur. This process is further increased with aging^{17,19}. The brain is especially susceptible to the neurotoxic effects of ROS due to its high demand for oxygen as well as the large amounts of peroxide susceptible lipid cells¹⁸. ROS have also been observed to cause disruptions in neuronal cell integrity and to modify and inactivate several proteins that are important for glucose metabolism and ATP synthesis resulting in mitochondrial dysfunction^{10,18}. The occurrence of the neurotoxic effects of ROS in the development of AD, coupled with the presence of Aβ,

supports the role of oxidative stress in the pathogenesis of AD^{18,20,21}. Several lines of evidence have revealed a connection between oxidative stress and A β formation^{10,19,22}. A β exhibits the ability to enhance the formation of ROS and *vice versa*^{22,23}. A β produces ROS through the promotion of oxidative modification and inhibition of important transmembrane transports systems within the neuronal and glial cells, A β -induced lipid peroxidation and protein oxidation^{22,24,25}. In addition, ROS also stimulate the enhanced activity of proteases, β and γ -secretase, which increases the formation of A β_{1-40} and A β_{1-42} ²³.

At present, there are no therapeutic agents that are able to reverse, halt or slow the progression of the disease and the current options are only able to treat AD symptomatically^{2,11,26-28}. All of these treatments follow the much researched “one-molecule–one-target” drug discovery approach with minimal success. Therefore, more researchers are exploring the development of multi-target directed ligands (MTDL)²⁶. MTDLs are conceived from the molecular hybridisation of various pharmacophoric moieties from recognised bioactive compounds. The MTDLs are designed to interact with multiple targets involved in the multifactorial pathogenesis of AD. The rational decision to combine these pharmacophores results in greater selectivity for the targets of AD, leads to fewer side effects and potentially improves the compounds’ neuroprotective abilities^{29,30}.

Edaravone (Figure 1(a)) is a potent free radical scavenger used to treat acute cerebral infarction in Japan³¹. In addition, edaravone has also exhibited beneficial neuroprotective effects in amyotrophic lateral sclerosis (ALS) and Parkinson’s disease animal models³². Edaravone’s neuroprotective effects are believed to be caused by its ability to scavenge ROS. The decrease in ROS levels in turn reduces oxidative stress and oxidative damage to neuronal cells^{33,34}. In previous studies, edaravone has demonstrated the ability to attenuate A β -induced oxidative stress and neurotoxicity, inhibit A β aggregation, disaggregate preformed A β fibrils and attenuate downstream pathologies including tau-hyperphosphorylation, neuroinflammation and neuronal cell loss^{31,35}.

In search for potentially potent and selective AChE inhibitors, benzyl pyridinium salts have been extensively researched (Figure 1(b))³⁶⁻³⁹ and *N*-benzyl pyridinium moieties have demonstrated excellent activity against AChE. Previous research has found that the best AChE inhibitory activity is reached when the *N*-benzyl pyridinium moiety is bound to another privileged molecule, using the MTDL strategy, to form a dual-site (PAS and CAS) binding compound^{37,38}. Substitutions, e.g. halogens and methyl groups, at various positions on the benzyl group of the moiety has demonstrated improved AChE inhibitory activity compared to an unsubstituted benzyl ring^{36,40}.

Thus, we describe here the docking, synthesis and biological evaluation of new edaravone-*N*-benzyl pyridinium hybrid compounds (Figure 2). These compounds are expected to exhibit strong dual-site AChE inhibitory activities and significant antioxidant capacity, which could lead to promising MTDL neuroprotective effects.

2. Materials and methods

2.1. Chemistry

All the reagents used to synthesise the desired compounds were acquired from Sigma-Aldrich® or Industrial Analytical (Pty) Ltd. All the reagents were used without further purification. Solvents used in the synthesis and purification of the compounds were obtained from a variety of commercial sources. Thin-layer chromatography (TLC) was used to monitor all reactions and was carried out on 0.20 mm thick aluminium silica gel sheets (TLC silica gel 60 F245 Merck KGaA). Visualisation of the samples was achieved using UV light (254 nm and 366 nm) and iodine vapours. Mobile phases were prepared on a volume-to-volume basis. Infra-red spectra were acquired using a Perkin Elmer Spectrum 400 spectrometer. The IR spectrometer was equipped with a diamond attenuated total reflectance (ATR) attachment. The spectra were then acquired from PerkinElmer, Inc. Spectrum version 10.5.4 IR software. The MS spectra of the compounds were acquired from a Waters SYNAPT G2 high resolution mass spectrometer. The melting points of the samples were acquired using a Lasec Melting Point SMP 10 apparatus and capillary tubes. Proton (¹H) and carbon (¹³C) spectra were acquired using a Bruker Avance IIIHD Nanobay 400 MHz instrument that is equipped with a 5 mm BBO probe. Tetramethylsilane (TMS) was used as the internal standard and deuterated dimethyl sulfoxide (DMSO-d₆) as the deuterated solvent. Chemical shifts (δ) and coupling constants (*J*) were reported in parts per million (ppm) and hertz (Hz) respectively. The internal standard (δ = 0 ppm) and DMSO-d₆ (δ = 2.5 ppm) were used as the reference peaks. The multiplicities of the respective signals were indicated using the following abbreviations: s – singlet, d – doublet, t – triplet, m – multiplet. The atom numbering of the target compounds used for ¹H NMR data are depicted on each respective compound found in the [supplementary data](#).

2.1.1. Synthesis of 4-(3-Methyl-5-oxo-4H-pyrazol-1-yl)-*N*-(pyridine-4-ylmethyl)benzamide (3)

The 4-(aminomethyl)pyridine moiety was conjugated to the carboxylic group of **1** via HATU activation chemistry. One equiv. edaravone-COOH (**1**) and four equiv. of *N,N*-diisopropylethylamine (DIPEA) was stirred at room temperature for 20 min. Thereafter, the carboxylic acid of **1** was activated using the HATU activation agent in a 1 equiv.:1.2 equiv. ratio in an appropriate quantity of dimethylformamide (DMF). The mixture was stirred at room temperature for 1 h and monitored using TLC (3 ethanol: 2 ethyl acetate: 4 diethyl ether). Once the reaction was complete, 4-(aminomethyl) pyridine (**2**) was added to the mixture and stirred under reflux at 40–50 °C for 1 h and monitored using TLC. Once the reaction was complete, toluene was added to the mixture in a ratio of 3 equiv. toluene: 1 equiv. DMF. The reaction was then rotary evaporated until just off dry. The mixture was left to precipitate out overnight in a refrigerator. Finally, the precipitate was filtered and washed with distilled water. The precipitate was

placed in a vacuum oven and allowed to dry rendering the desired compound **3**.

Physical data: Yield: 72.52%; light pink solid; mp: 234 °C; Rf: 0.45; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.10–9.13 (t, 1H, *J* = 5.60, 5.83, 11.43 Hz, H—12), 8.50–8.51 (d, 2H, *J* = 5.88 Hz, H—16, 17), 7.95–7.98 (d, 2H, *J* = 8.68 Hz, H—6, 10), 7.85–7.87 (d, 2H, *J* = 8.64, H—7, 9), 7.30–7.32 (d, 2H, *J* = 5.76 Hz, H—15, 18), 4–4.9–4.51 (s, 2H, H—13), 2.13 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.36, 149.98, 149.15, 128.66, 122.62, 120.10, 42.21, 14.70; IR: (FT-IR, cm⁻¹): 3217, 3035, 1713, 1637; MS: (HR-ESI⁺), [M + H⁺], *m/z*: calcd.: 309.1273, found: 309.1347.

2.1.2. General procedure for the synthesis of compounds **5a–l**

Compound **3** (1 equiv.) and 1.3 equiv. of the respective substituted benzyl bromide derivative (**4**) were dissolved and stirred under reflux, at 40–50 °C, in 5–6 ml of DMF. The compounds were monitored using TLC (3 ethanol: 2 ethyl acetate: 4 diethyl ether) for 4–6 h. Once the reaction was complete, 3 equiv. toluene: 1 equiv. DMF was added. The mixture was then rotary evaporated to dryness. Thereafter, 20 ml of diethyl ether was added to the dried mixture. The mixture was then left to precipitate out overnight in a refrigerator. Thereafter, if solid, the precipitate was filtered off and washed with diethyl ether. If the precipitate exhibited a waxy/oily appearance the mixture was diluted in a minimal amount of ethanol and transferred into a polytop. Finally, the precipitate or waxy/oily substance was dried, rendering the desired compounds **5a–l**.

2.1.2.1. 1-Benzyl-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5a). Physical data: Yield: 95.29%; light grey solid; mp: 225 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.33–9.36 (t, 1H, *J* = 5.60, 5.72, 11.32 Hz, H—12), 9.11–9.12 (d, 2H, *J* = 6.32 Hz, H—16, 17), 8.06–8.07 (d, 2H, *J* = 6.24 Hz, H—15, 18), 7.97–7.99 (d, 2H, *J* = 8.60 Hz, H—6, 10), 7.87–7.89 (d, 2H, *J* = 8.64 Hz, H—7, 9), 7.43–7.53 (m, 5H, H—21, 22, 23, 24, 25), 5.83 (s, 2H, H—19), 4.72–4.74 (d, 2H, *J* = 5.28 Hz, H—13), 2.13 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.68, 162.79, 160.74, 159.84, 144.80, 134.87, 129.83, 129.72, 129.59, 129.23, 128.96, 128.84, 126.55, 119.36, 117.36, 63.14, 42.80, 17.19; IR: (FT-IR, cm⁻¹): 3184, 3034, 1717, 1639; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 399.1815, found: 399.1820.

2.1.2.2. 1-[(2-Fluorophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5b). Physical data: Yield: 97.17%; black solid; mp: 191 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.33–9.36 (t, 1H, *J* = 5.72, 5.83, 11.55 Hz, H—12), 9.03–9.04 (d, 2H, *J* = 6.44 Hz, H—16, 17), 8.06–8.08 (d, 2H, *J* = 6.52 Hz, H—15, 18), 7.87–8.00 (m, 4H, H—6, 7, 9, 10), 7.58–7.62 (t, 1H, *J* = 7.68, 7.56, 15.24, Hz, H—22), 7.51–7.55 (m, 1H, H—23), 7.34–7.35 (d, 1H, *J* = 1.88 Hz, H—24), 7.30–7.32 (d, 1H, *J* = 7.96 Hz, H—25), 5.93 (s, 2H, H—19), 4.74–4.75 (d, 2H, *J* = 5.40 Hz, H—13), 2.14 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.69, 162.78, 162.20, 161.08, 145.01, 132.65, 132.57, 131.96, 128.83, 126.53, 125.81, 125.78, 121.87, 121.72, 117.37, 116.62, 116.41, 57.83, 42.84; IR: (FT-IR, cm⁻¹): 3201, 3034, 1717, 1638; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 417.1721, found: 417.1719.

2.1.2.3. 1-[(3-Fluorophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5c). Physical data: Yield: 98.48%; brown solid; mp: 220 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.33–9.36 (t, 1H, *J* = 5.60, 5.83,

11.43 Hz, H—12), 9.11–9.13 (d, 2H, *J* = 6.64 Hz, H—16, 17), 8.07–8.08 (d, 2H, *J* = 6.56 Hz, H—15, 18), 7.87–8.00 (m, 4H, H—6, 7, 9, 10), 7.48–7.54 (m, 1H, H—23), 7.45–7.48 (d, 1H, *J* = 10.2, H—21), 7.37–7.39 (d, 1H, *J* = 7.72 Hz, H—25), 7.26–7.31 (m, 1H, H—24), 5.85 (s, 2H, H—19), 4.73–4.75 (d, 2H, *J* = 5.32, H—13), 2.14 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.68, 163.88, 161.44, 160.89, 144.89, 137.26, 137.18, 131.91, 131.82, 128.84, 126.58, 125.48, 125.45, 119.39, 117.36, 116.87, 116.47, 62.34, 42.82, 17.18; IR: (FT-IR, cm⁻¹): 3201, 3036, 1716, 1638; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 417.1721, found: 417.1732.

2.1.2.4. 1-[(4-Fluorophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5d). Physical data: Yield: 87.13%; light grey solid; mp: 215 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.32–9.35 (t, 1H, *J* = 5.60, 5.80, 11.43 Hz, H—12), 9.09–9.10 (d, 2H, *J* = 6.64 Hz, H—16, 17), 8.05–8.07 (d, 2H, *J* = 6.48 Hz, H—15, 18), 7.87–7.99 (m, 4H, H—6, 7, 9, 10), 7.61–7.64 (m, 2H, H—22, 25), 7.28–7.32 (t, 2H, *J* = 8.80, 17.60 Hz, H—21, 25), 5.81 (s, 2H, H—19), 4.72–4.73 (d, 2H, *J* = 5.44 Hz, H—13), 2.13 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.67, 164.27, 161.82, 160.76, 144.72, 131.93, 131.85, 131.09, 131.06, 128.94, 128.83, 126.55, 117.36, 116.74, 116.53, 62.29, 42.81, 17.19; IR: (FT-IR, cm⁻¹): 3201, 3036, 1716, 1638; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 417.1721, found: 417.1729.

2.1.2.5. 1-[(2-Chlorophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5e). Physical data: Yield: 96.53%; black solid; mp: 211 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.36–9.38 (t, 1H, *J* = 5.60, 5.72, 11.32 Hz, H—12), 9.00–9.02 (d, 2H, *J* = 6.32 Hz, H—16, 17), 8.07–8.09 (d, 2H, *J* = 6.28 Hz, H—15, 18), 7.98–8.01 (d, 2H, *J* = 8.64 Hz, H—6, 10), 7.88–7.90 (d, 2H, *J* = 8.68 Hz, H—7, 9), 7.59–7.61 (d, 1H, *J* = 7.44 Hz, H—22), 7.47–7.54 (m, 3H, H—23, 24, 25), 5.97 (s, 2H, H—19), 4.76–4.77 (d, 2H, *J* = 5.32 Hz, H—13), 2.13 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.71, 162.79, 161.17, 145.19, 133.77, 132.09, 131.98, 130.61, 129.58, 128.96, 128.84, 128.67, 126.42, 119.38, 117.37, 61.11, 42.83, 17.81; IR: (FT-IR, cm⁻¹): 3212, 3034, 1711, 1638; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 433.1425, found: 433.1441.

2.1.2.6. 1-[(3-Chlorophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5f). Physical data: Yield: 21.31%; black solid; mp: 228 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.30–9.33 (t, 1H, *J* = 5.60, 5.83, 11.43 Hz, H—12), 9.09–9.11 (d, 2H, *J* = 6.6 Hz, H—16, 17), 8.05–8.07 (d, 2H, *J* = 6.44 Hz, H—14, 18), 7.96–7.98 (d, 2H, *J* = 8.72 Hz, H—6, 10), 7.87–7.89 (d, 2H, *J* = 8.76 Hz, H—7, 9), 7.69 (s, 1H, H—21), 7.47–7.52 (t, 3H, *J* = 13.62, 6.22, 19.84 Hz, H—23, 24, 25), 5.81 (s, 2H, H—19), 4.73–4.74 (d, 2H, *J* = 5.40 Hz, H—13), 2.13 (s, 3H, H—1); ¹³C NMR: (400 MHz, DMSO-d₆): 166.69, 160.90, 144.89, 137.00, 134.16, 131.62, 129.83, 129.31, 128.83, 128.05, 126.60, 62.31, 42.84, 14.62; IR: (FT-IR, cm⁻¹): 3213, 3035, 1710, 1639; MS: (HR-ESI⁺), [M-Br]⁺, *m/z*: calcd.: 433.1425, found: 433.1430.

2.1.2.7. 1-[(2-Bromophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methylpyridin-1-ium bromide (5g). Physical data: Yield: 94.2%; black solid; mp: 204 °C; ¹H NMR: (400 MHz, DMSO-d₆), δ_H: 9.53–9.37 (t, 1H, *J* = 5.60, 5.83, 11.43 Hz, H—12), 8.98–9.00 (d, 2H, *J* = 6.52 Hz, H—16, 17), 8.07–8.09 (d, 2H, *J* = 6.40 Hz, H—15, 18), 7.87–8.00 (m, 4H, H—6, 7, 9, 10), 7.76–7.78 (d, 1H, *J* = 7.60 Hz, H—25), 7.49–7.53 (t, 1H, *J* = 7.06, 7.40, 14.46 Hz, H—22), 7.36–7.44 (m, 2H, H—23, 24), 5.94 (s, 2H, H—19),

4.76–4.78 (d, 2H, $J=5.44$, H—13), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6): 166.71, 162.77, 161.21, 145.24, 133.91, 133.56, 132.04, 131.98, 129.18, 128.96, 128.84, 126.41, 123.98, 63.17, 42.84, 14.62; IR: (FT-IR, cm^{-1}): 3217, 3034, 1711, 1638; MS: (HR-ESI $^+$) [M-Br] $^+$, m/z : calcd.: 477.0920, found: 477.0928.

2.1.2.8. 1-([3-Bromophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido) methylpyridin-1-ium bromide (5h). Physical data: Yield: 17.73%; dark grey solid; mp: 230 °C; ^1H NMR: (400 MHz, DMSO- d_6), δ_{H} : 9.30–9.33 (t, 1H, $J=5.60$, 5.72, 11.32 Hz, H—12), 9.09–9.10 (d, 2H, $J=6.4$ Hz, H—16, 17), 8.05–8.07 (d, 2H, $J=6.32$ Hz, H—15, 18), 7.96–7.98 (d, 2H, $J=8.60$ Hz, H—6, 10), 7.87–7.89 (d, 2H, $J=8.64$ Hz, H—7, 9), 7.83 (s, 1H, H—21), 7.63–7.65 (d, 1H, $J=8.00$ Hz, H—23), 7.52–7.54 (d, 1H, $J=7.76$ Hz, H—25), 7.39–7.54 (t, 1H, $J=7.74$, 7.90, 15.64 Hz, H—24), 5.80 (s, 2H, H—19), 4.73–4.74 (s, 2H, $J=5.36$ Hz, H—13), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6): 166.69, 160.89, 144.88, 137.24, 132.74, 132.15, 131.86, 128.83, 128.43, 126.60, 122.72, 62.26, 42.84; IR: (FT-IR, cm^{-1}): 3216, 3035, 1711, 1638; MS: (HR-ESI $^+$), [M-Br] $^+$, m/z : calcd.:477.0920, found: 477.0940.

2.1.2.9. 1-([4-Bromophenyl)methyl]-4-([4-(3-methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido) methylpyridin-1-ium bromide (5i). Physical data: Yield: 97.42%; black solid; mp: 190 °C; ^1H NMR: (400 MHz, DMSO- d_6), δ_{H} : 9.33–9.36 (t, 1H, $J=5.95$, 11.90 Hz, H—12), 9.08–9.10 (d, 2H, $J=6.80$ Hz, H—16, 17), 8.06–8.07 (d, 2H, $J=6.64$ Hz, H—15, 18), 7.95–7.99 (m, 2H, H—6, 10), 7.89–7.87 (d, 2H, $J=8.88$ Hz, H—7, 9), 7.65–7.68 (d, 2H, $J=8.40$ Hz, H—22, 24), 7.48–7.50 (d, 2H, $J=8.44$ Hz, H—21, 25), 5.81 (s, 2H, H—8), 4.72–4.74 (d, 2H, $J=5.52$ Hz, H—13), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6): 166.67, 162.77, 160.85, 144.84, 134.11, 132.64, 131.58, 128.96, 128.84, 126.56, 123.34, 62.32, 42.80; IR: (FT-IR, cm^{-1}): 3217, 3034, 1715, 1638; MS: (HR-ESI $^+$), [M-Br] $^+$, m/z : calcd.: 477.0920, found: 477.0943.

2.1.2.10 4-([4-(3-Methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methyl-1-(2-methylphenyl)-pyridin-1-ium bromide (5j). Physical data: Yield: 21.75%; light grey solid; mp: 194 °C; ^1H NMR: (400 MHz, DMSO- d_6), δ_{H} : 9.34–9.37 (t, 1H, $J=5.60$, 5.83, 11.43 Hz, H—12), 8.93–8.95 (d, 2H, $J=6.64$ Hz, H—16, 17), 8.06–8.08 (d, 2H, $J=6.56$ Hz, H—15, 18), 7.98–8.00 (d, 2H, $J=8.80$ Hz, H—6, 10), 7.87–7.89 (d, 2H, $J=8.80$ Hz, H—7, 9), 7.20–7.37 (m, 3H, H—23, 24, 25), 7.12–7.14 (d, 1H, $J=7.52$ Hz, H—26), 5.88 (s, 2H, H—19), 4.75–4.76 (d, 2H, $J=5.40$ Hz, H—13), 2.29 (s, 3H, H—22), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6): 166.70, 162.77, 160.81, 144.98, 137.38, 132.82, 131.43, 129.87, 129.57, 128.95, 128.83, 127.20, 126.49, 117.37, 61.36, 42.81, 19.23, 17.19; IR: (FT-IR, cm^{-1}): 3215, 3035, 1715, 1639; MS: (HR-ESI $^+$), [M-Br] $^+$, m/z : calcd.: 413.1972, found: 413.1968.

2.1.2.11. 4-([4-(3-Methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methyl-1-(3-methylphenyl)-pyridin-1-ium bromide (5k). Physical data: Yield: 98.3%; black powder; mp: 212 °C; ^1H NMR: (400 MHz, DMSO- d_6), δ_{H} : 9.31–9.34 (t, 1H, $J=5.60$, 5.83, 11.43 Hz, H—12), 9.08–9.09 (d, 2H, $J=6.64$ Hz, H—16, 17), 8.04–8.06 (d, 2H, $J=6.52$ Hz, H—15, 18), 7.96–7.98 (d, 2H, $J=8.88$ Hz, H—6, 10), 7.87–7.89 (d, 2H, $J=8.80$ Hz, H—7, 9), 7.33–7.35 (d, 1H, $J=5.24$ Hz, H—21), 7.29–7.31 (t, 2H, $J=2.35$, 7.40, 9.75 Hz, H—24, 25), 7.23–7.24 (d, 1H, $J=6.84$ Hz, H—26), 5.77 (s, 2H, H—19), 4.72–4.73 (d, 2H, $J=5.44$ Hz, H—13), 2.30 (s, 3H, H—23), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6): 166.68, 160.68, 144.76, 139.10, 134.76, 130.46, 129.75, 129.63, 128.83, 126.52, 126.32, 63.19, 42.81,

21.38, 17.1; IR: (FT-IR, cm^{-1}): 3208, 3034, 1716, 1638; MS: (HR-ESI $^+$), [M-Br] $^+$, m/z : calcd.:413.1972, found: 413.1973.

2.1.2.12. 4-([4-(3-Methyl-5-oxo-4H-pyrazol-1-yl)phenyl]foramido)methyl-1-(4-methylphenyl)-pyridin-1-ium bromide (5l). Physical data: Yield: 60.13%; light grey solid; mp: 230 °C; ^1H NMR: (400 MHz, DMSO- d_6), δ_{H} : 9.30–9.33 (t, 1H, $J=5.60$, 5.83, 11.43 Hz, H—12), 9.06–9.08 (d, 2H, $J=6.6$ Hz, H—167, 17), 8.03–8.05 (d, 2H, $J=6.52$ Hz, H—15, 18), 7.96–7.98 (d, 2H, $J=8.68$ Hz, H—6, 10), 7.86–7.89 (d, 2H, $J=8.76$ Hz, H—7, 9), 7.41–7.43 (d, 2H, $J=7.96$ Hz, H—21, 26) 7.24–7.26 (d, 2H, $J=7.88$ Hz, H—22, 25), 5.76 (s, 2H, H—19), 4.71–4.72 (d, 2H, $J=5.44$ Hz, H—13), 2.29 (s, 3H, H—24), 2.13 (s, 3H, H—1); ^{13}C NMR: (400 MHz, DMSO- d_6):166.67, 160.64, 144.67, 139.89, 131.89, 130.24, 129.29, 128.82, 126.50, 63.01, 42.81, 21.21, 17.1; IR: (FT-IR, cm^{-1}): 3224, 3032, 1714, 1638; MS: (HR-ESI $^+$), [M-Br] $^+$, m/z : calcd.: 413.1972, found: 413.1974.

2.2. Ache molecular docking studies

Molecular Operating Environment (MOE) 2018.10 software package⁴¹ was employed to predict the interactions and binding modes of the novel compounds within the active site of TcAChE. The co-crystallised structure of TcAChE with donepezil (PDB accession code: 1EVE) was acquired from the Protein Data Bank (PDB)³⁸. The following protocol was employed, as previously described⁴², to simulate the orientation and binding interactions of the test compounds. Firstly, the test compounds were drawn using ChemSketch v2019.2.1 and saved as a mol files. Secondly, the enzyme structures were inspected for missing atoms, bonds and contacts. Thirdly, partial charges and hydrogens were added using MOEs' protonate 3D application. Fourthly, the ligands were assembled employing the builder module in MOE and energy minimisation (MMFF94x) was performed. Thereafter, the ligands were docked, using the MOEdock application, within the AChE active site. Finally, the retained best poses, as per their binding affinity scores, were inspected visually and analysis of the interactions within the active aromatic gorge of AChE was conducted. To determine the accuracy of this docking protocol, the co-crystallised ligand, was re-docked into the AChE active site. This procedure was repeated three times and the best ranked solution exhibited an RMSD value of less than 2.0 Å from the position of the co-crystallised ligand. The RMSD value in this case is smaller than 2.0 Å indicating that the docking protocol is capable of accurately predicting the binding orientation of the co-crystallised ligand⁴³. This protocol was thus deemed to be suitable for the docking of inhibitors into the active site model of AChE.

2.3. Pharmacological evaluation studies

2.3.1. Cholinesterase inhibition assay

A modified Ellman's method was employed to determine the ChE inhibitory activities of the synthesised compounds⁴⁴. eeAChE, eqBuChE, 5,5'-dithiobis-(2-nitrobenzoic acid) (DTNB, commonly known as Ellman's reagent), S-butrylthiocholine iodide (BTCl), acetylthiocholine iodide (ATCl) and donepezil were purchased from Sigma-Aldrich®. eeAChE, eqBuChE, DTNB, BTCl and ATCl were diluted with a buffer solution (tris hydrochloride (50 mM), pH 8). Each well of a 96 well plate, contained the following; 148 μL of 1.5 mM DTNB, 50 μL of either 0.22 U/ml eeAChE or 0.12 U/ml eqBuChE and 2 μL of either test compound, control (donepezil) or blank [dimethyl sulfoxide (DMSO)]. The test compounds and control were dissolved in DMSO and added to the well to yield

found to be more stable as no peaks were present at $\delta = 5.4$ ppm and $\delta = 11.7$ ppm (Figure 6). This finding is in accordance to previous research as it has been found that the enol and keto tautomeric forms are both found within this solvent system. In addition, the keto tautomer was found to be the predominant of the two tautomeric forms in methanol⁶¹. The enol tautomer ^1H NMR peak for the CH-group at $\delta = \sim 6.2$ ppm⁶² was not present and further confirms the presence of the keto tautomer within the methanol- d_4 solvent system. The formation of the edaravone tautomers are dependent on certain solvation effects and electrostatic interactions between the solvent and molecule and further studies are to be conducted to explore the tautomeric nature of these hybrid molecules. Based on the data in this study, the keto tautomer of these hybrid molecules seems to be more stable in polar protic solvents whereas its amine tautomeric form is more stable in polar aprotic solvents. As the biological evaluations on these compounds were carried out in protic environments it is expected that the keto tautomer will be the predominant form present. The effects of the different tautomers on the biological profile of these compounds should therefore be taken into consideration for future pharmaceutical development.

The inhibitory activities of the synthesised compounds were evaluated using eeAChE (*electric eel*) and eqBuChE (*equine serum*) according to a modified method of Ellman⁴⁴. Donepezil, a known potent ChE inhibitor, was used as the reference compound for both assays. This reference compound was chosen as the structure of donepezil contains similarities to the *N*-benzyl pyridinium moiety of the synthesised compounds. Compounds **5b–5g** exhibited some of the best inhibitory activities (Table 1). These compounds have either a fluorine or chlorine substituted at various positions of the benzyl moiety and exhibited IC_{50} values between 1.2 and $4.6\ \mu\text{M}$. It can be deduced that smaller and more electronegative substitutions, such as fluorine or chlorine, in comparison to larger substitutions, such as bromine (**5h–5j**) or methyl (**5g–5i**), is

preferred as it results in superior inhibitory activity (Table 1). The majority of the final compounds also exhibited improved activity compared to the unsubstituted benzyl moiety of **5a**.

In addition, all the compounds with substituents in the ortho position of the benzyl ring (**5b**, **5e**, **5g**, **5j**) exhibited the highest inhibitory activities when compared to their meta and para counterparts. This finding is similar to that reported in previous studies^{37,66}. The superior activity observed for **5a–5l** when compared to intermediate **3**, could be due to the increase in the length of the molecule. Molecular modelling corresponds with this observation in that **3** is too short to interact with both the PAS and CAS

of the AChE active site. This also confirms the importance of the *N*-benzyl pyridinium group for optimal AChE inhibitory activity within these compounds.

Compounds **5a–5l** also exhibited highly selective AChE inhibitory activity over BuChE (Table 1, SI:11 – >278). It can be speculated that the poor BuChE inhibitory results exhibited by all the compounds are due to the phenyl ring of edaravone and the pyridinium moiety exhibiting π – π interactions with the aromatic residues of AChE but are not able to exhibit similar interactions with BuChE's aliphatic and/or aromatic residues^{67,68}. The *N*-benzyl pyridinium moiety presents a similar structure to donepezil's benzylpyridine moiety⁶⁹. Therefore, the high selectivity of the hybrid compounds for AChE compared to BuChE was expected. Selectivity to AChE is advantageous as it has been shown to result in lower incidences of cholinergic side effects and wider therapeutic indices compared to non-selective cholinesterase inhibitors⁷⁰. Most of the hybrid compounds exhibited proficient AChE inhibitory activity when compared to previously designed, AChE acting MTDLs³⁰.

The 2,2-diphenyl-1-picrylhydrazyl (DPPH⁺) assay was employed to determine the antioxidant ability of the synthesised compounds. Trolox, a known potent antioxidant, was used as the reference compounds for this assay⁷¹. Compounds **3**, **5d–j** and **5l** (IC₅₀: 9.5–19 μ M) exhibited similar or greater antioxidant activity when compared to the control, Trolox (IC₅₀ = 13.1 μ M). In addition, these compounds retained the antioxidant activity of edaravone (IC₅₀ = 4.7 μ M)⁶⁵. Compound **5j** had the best IC₅₀ of 9.5 μ M. The rest of the compounds within the series exhibited greater antioxidant activity compared to **1**. These results correspond with previous literature in that a large lipophilic substitution on the 4-position of the phenyl ring of the edaravone moiety improves its antioxidant activity when compared to a smaller carboxylic group on the 4-position of the phenyl ring of the edaravone structure^{58,72,73}.

Potential AD therapeutic agents are required to cross the blood–brain barrier (BBB) to act in the CNS. Therefore, an *in silico* model^{49,63} was used to determine the blood–barrier permeability of the synthesised compounds. The BBB permeability prediction score represents the compounds ability to cross the BBB. A threshold score of over 0.02 is considered that the compounds are BBB permeable (BBB+) and a score below 0.02 is considered that the compounds are BBB impermeable (BBB–). The results are shown in Table 1. All the compounds exhibit scores of above 0.02 and are therefore predicted to effectively cross the BBB.

4. Conclusions

The main goal of this study was to design and synthesise a novel series of multi-target directed edaravone-*N*-benzyl pyridinium hybrid compounds that exhibit cholinesterase inhibitory activity and significant antioxidant ability. The molecular modelling results showed that these compounds should be able to form significant interactions within the PAS and CAS of the AChE active site, which in turn should lead to notable inhibitory activities. The *in vitro* cholinesterase results indicated excellent selective AChE inhibitory activity. Compounds **5b–g** demonstrated the best AChE inhibitory activity showing that smaller substitutions, e.g. fluorine and chlorine, especially in the ortho benzyl position is important for AChE inhibitory activity. Compounds **5d–j** and **5l** exhibited potent antioxidant activity that was comparable to trolox and edaravone. *In silico* blood–brain barrier evaluations predicted that all these hybrid compounds should cross the BBB. Compound **5d–g** presented as the most promising MTDL candidates against AD. These

compounds exhibited excellent selective AChE inhibitory activities (IC₅₀: 1.9–3.6 μ M), promising antioxidant abilities (IC₅₀: 11.5–19 μ M) and are predicted to cross the BBB. Further exploration of these compounds' abilities to exhibit A β inhibitory activity, neuroprotection and their pharmacokinetic- and toxicity profiles are recommended.
