## Motivation

Effective parameters for film formation
Drop velocity and trajectory

- Exhaust gas flow rate
- Wettability of solid surface

### Conclusion

- Strong interactions of micro and macro scale phenomena influence film and deposit formation
- Shear flow depends on gas mass flow and geometry and affects the diameter of detached droplets
- Rough deposit structures influence the droplet detachment leading to larger secondary drops
- Stagnant film formation potentially reduced by low wettability, high flow rates and oblique impact

#### Acknowledgements

This study is partially financially supported by the Friedrich and Elisabeth Boysen Foundation. We would like to thank Mr. Daniel Kümmel from the IAM, KIT for his assistance with confocal microscopy measurements. Simulations were performed on the bwUniCluster funded by the Ministry of Science, research and Arts Baden-Württemberg.
