The views and opinions expressed in this paper are solely those of the author(s) and do not necessarily reflect those of Birmingham City University. This Working Paper presents research in progress by the author(s) and is published to elicit comments and further debate.

Action research to reassess the effectiveness of a blended learning approach in postgraduate business education using unified theory of acceptance and use of technology model

Dr Muhammad Surajo Sanusi

Department of Accountancy and Finance Birmingham City Business School Faculty of Business, Law and Social Sciences Birmingham City University 4 Cardigan Street BIRMINGHAM B4 7BD

Tel: +44 (0) 121 331 5224 Email: <u>muhammad.sanusi@bcu.ac.uk</u> Email Address: <u>mssanusi2003@yahoo.co.uk</u> Abstract: Although the pedagogy of blended learning in higher education has been well-accepted since its inception in 2000 particularly due to the incessant technological innovations, its impact on students' experience has been reliant on various factors. This includes cultural diversity and background, technical abilities, level of organisational support, language difficulties, educational background, learning environment, instructional design, and many others. In this study, the effectiveness of the blended learning approach has been practically reassessed among the diverse cohorts of international students at Birmingham City University. The motivation for the selection of this sample was to enable the inclusion of diversity as one of the focal points of the study. Data was collected from the action research undertaken and analysed based on a survey research method. This was to test the significance of the hypotheses formulated and find answers to the research questions that were designed to portray the central intent of the study. Based on the action research, two-cycle model was adopted to reassess the effectiveness of blended learning in comparison to the traditional learning approach. In the first cycle, the effectiveness of traditional learning approach was tested. The mixed responses received had justified the implementation of the second cycle of the action research. In the second cycle, the blended learning approach was adopted in the class session and its effectiveness tested by administering questionnaires to the students under study. Furthermore, multiple regressions were employed using unified theory of acceptance and use of technology (UTAUT) to test the significance of each variable collected from the survey on the students' learning experience and engagement. Our results have suggested that students' engagement is determined by positive learning experience without any bias to traditional or blended learning approach. Students' age group was found to be relevant in the determination of behavioural intention, social influence, effort expectancy, performance expectancy and facilitating conditions towards the effective use of technology and blended learning. Students' gender was an irrelevant factor in the success of blended learning approach.

**Keywords:** Action research; Blended learning; Unified theory of acceptance and use of technology; Triangular model; Traditional learning; Students' engagement; Learning experience.

## 1. Introduction

Students' learning experience has continued to be an important yardstick for measuring the success of teaching and learning activities in higher education. In the United Kingdom, teaching excellence framework (TEF) has recently been established to assess the higher education providers' commitment in ensuring positive students' learning experience in universities and colleges (Office for Students (OFS), 2018). The key parameters of success identified in the framework are teaching quality, learning environment, students' outcomes and learning gain. The role of teachers or instructors is indispensable in the TEF key parameters of success in the quality of teaching. For example, Kangas, et al. (2017) stressed that teachers are expected to adopt various teaching methods and utilize novel learning environments with technologies to ensure positive learning experience among students. Scholars such as Davis and Davis (1990), Kerwin (1981) and Lam & Wong (1974) have also suggested that learning satisfaction is influenced by factors such as teacher's teaching skills, contents of delivery in teaching, individual characteristics and students' participation. Verkuyten and Thijs (2002) have added that conducive academic and social climates in the class are responsible for the positive experience on students' satisfaction with learning. In the view of Fischer et al. (2018), positive learning experience depends on the ability of teachers to align their teaching styles to a new or evolving educational landscape. In a wider perspective, Hicks et al. (2001) highlighted that the increasing demand for higher education institutions to provide for a larger and more diverse cross-section of the population was the main cause of the rapid evolvement in educational practice (see also Fry et al. (2008) and McKenzie et al. (2013)). This also led to the advent of new pedagogies in teaching profession.

To find the most effective teaching and learning approach for the achievement of optimal students' satisfaction and learning outcome, many pedagogical concepts have been employed by researchers and practitioners in higher education. Among these pedagogical concepts adopted or tested are blended learning approach (Garrison and Kanuka, 2004; Picciano, 2009; Khodeir, 2018; Kaur, 2013; Boelens, et al., 2018), flipped learning approach (Awidi and Paynter, 2019; Kolb and Kolb, 2005; Hafidi and Mahnane, 2018; Cavanagh, 2011; Soliman, 2016; Lin, 2018; Lombardini et al., 2018), traditional learning approach (Byers et al., 2018; Tortorella and Cauchick-Miguel,

3

2018; Clayton et al., 2018), playful learning approach (Kangas et al., 2017; Resnick, 2006; Hyvönen and Marjaana, 2005). Despite the large number of studies conducted on teaching pedagogies, scholars such as Khodeir (2018) have recommended for further research on pedagogies to examine their impact on students' satisfaction or the process of their implantation among diverse cross-sections of students.

The purpose of this action research is to reassess the effectiveness of blended learning approach, comparing it with a traditional learning approach among the selected cohorts of international postgraduate business students at Birmingham City University. The novelty of the study lies in the methodology of two-cycle action research adopted to exclusively adopt the two learning approaches at different times among the cohorts under study. The methodology will also include the use of technology acceptance model in assessing the effectiveness of the blended learning approach.

## 2. Review of literature

Blended learning approach has been increasingly adopted in higher education institutions because of its flexibility (Prasad et al., 2018). It involves both the face-toface and the online teaching techniques that empower the teacher or instructor to be flexible in the adoption of the two approaches based on the learning needs of the students (Partridge et al., 2011). The approach has been described by Garrison and Kanuka (2004) as both simple and complex because it is seemingly an extension of the traditional face-to-face learning approach. The scholars have also argued that the inclusion of internet-based learning activities in the pedagogy of blended learning is considerably complex but not too advanced. Blended learning approach has been very successful in the Western universities compared to other international higher education institutions (Prasad et al., 2018). This could be due to the differences in previous learning experiences that exist between Western and international students which resulted in a digital inequality as claimed by Prasad et al. (2018). The background of students in terms of their social, economic and cultural disposition is responsible for the digital inequality (Ignatow and Robinson, 2017). As one of the reasons behind the success of blended learning in the Western World was due to the spread of internet and technological advancement (Güzer and Caner, 2014). Since

4

the influx of international students for various programmes in the Western universities has been significant over the years (Haggis, 2003), the undoubtful success of blended learning has been subjected to further investigations by many researchers. For example, Boelens et al. (2018) have tested the effectiveness of various designs of blended learning in relation to the growing students' diversity in the Belgian higher education. A total of twenty instructors were used in their study. The instructors were encouraged to design and implement various strategies in blended learning to address the diversity of the students. Their findings reveal three different perceptions of the instructors on the implementation of the blended learning approach. The first class of instructors have disregarded the special needs of students in the implementation of blended learning. They employed the commonly used strategies of the blended learning without any transformation. In this situation, students' satisfaction may not be positive. The second class of instructors believed that an increased support in the existing blended learning would reasonably address the special needs of students. The third class of instructors believed that blended learning should be completely designed in cognisance of the special learning needs of the students, and thus achieve the optimal students' satisfaction. These findings indicate that the success of blended learning approach depends on the perception and attitude of instructors. Mieg (2009) and Smith and Strahan (2004) have also made the same conclusion.

Case study research studies have been conducted to examine the differences between blended and traditional learning by scholars such as Nazarenko (2015) and Byers et al. (2018). Nazarenko (2015) undertook a case study research on university students to assess the impact of the two approaches on students' experience. The findings indicated that students' professional and informational competencies were improved with blended learning approach. Khodeir (2018) and Byers et al. (2018) have gone to the extent of changing classroom layout to reflect traditional and blended approaches respectively. The scholars have all discovered the importance of learning spaces in effective learning.

Learners' behavioural intentions towards the use of blended learning have also been investigated by scholars. The learners' behavioural intentions towards the use of technology were mostly examined. In the study of Prasad et al. (2018), a unified theory of acceptance and use of technology (UTAUT) model was adopted. The model was

used to assess the importance of learners' social influence (behavioural intention), facilitating conditions (ease of use), and effort expectancy (attitude) towards the use of technology as the key to successful implementation of blended learning pedagogy. Several scholars have used technology acceptance models in a similar way to assess the effectiveness of blended learning in higher education, considering the growing number of international students in the Western universities and colleges. Some of these models are the theory of reasoned action (TRA) (Fishbein and Ajzen, 1975), the theory of planned behaviour (TPB) (Ajzen, 1985) and technology acceptance model (TAM) (Davis, 1989; Scherer et al., 2019). Results were mixed. However, the crucial findings are that the success stories of blended learning approach were from studies on the learning satisfaction of local (European) students (Francis and Shannon, 2013; Johnson et al., 2016; Prasad et al., 2018). Bower et al. (2014) believed that changes are needed to the existing blended learning to include skilful integration of online and face-to-face teaching materials as well as ensure purposeful design to address the special needs of learners. Chang and Cheung (2001) have identified a challenge to blended learning due to the barriers to the full acceptance of technology by international students (see also Kennedy et al., 2008). The mixed results and the failure to consider blended learning as a challenge-free pedagogy justify the need for this research.

## 3. Research methodology

## 3.1 Action research

A two-cycle model of action research was adopted as in Mertler and Charles (2008) to assess the effectiveness of blended learning approach among international MBA students at Birmingham City University. According to Muir (2007), each of the two cycles of the action research will consist actions of planning, executing, or intervening, analysing, reflecting and findings. We intend to have an initial observation of the current situation prior to the commencement of first cycle of the action research. Our reflection and findings from the first cycle will be our guide to plan our action for the second cycle.

6

#### 3.2 Survey method

Questionnaires were administered among two different cohorts of students enrolled for International MBA degree. Class sessions used for the action research were arranged to be undertaken separately using different learning approaches. The duration of the class sessions was planned to be seven hours each for teaching and learning activities based on traditional and blended learning approach respectively. A total of 84 surveys were completed and two were excluded due to incomplete responses.

## 3.3 Data analysis

Data collected from the two cycles of the action research was analysed based on a survey research method. In the analysis of the data, descriptive statistics and multiple regressions were employed as in Prasad et al (2018) to test the significance of the variables collected. The aim was to assess the postgraduate students' engagement with Information Technology platforms such as Moodle and Mahara using unified theory of acceptance and use of technology (UTAUT) model, (Venkatesh et al., 2003). The adoption of UTAUT was motivated by the intention to investigate the readiness and efforts of different cohorts of postgraduate students in adopting the systems of Moodle and Mahara in blended learning. A triangular model was also adopted to test students' satisfaction in a class session based on a traditional learning approach by using three key areas of traditional learning environment (TLE), learning experience (LE) and students' engagement (SE). A two-way multiple regression analysis will be carried to assess whether traditional learning environment (TLE) and students' engagement (SE) as independent variables can be responsible for positive learning experience (LE) as a dependent variable. In a similar way, TLE and LE will be used as independent variables and SE as a dependent variable. The extent of relationship between the three variables will equally be assessed.

#### 3.4 Models

Figures 1 and 2 below show the models adopted to assess students' satisfaction under both traditional and blended learning approach. Figure 1 tests the experience under traditional methods, while Figure 2 deals with the model to explore the blended learning approach. The models are tested using the survey responses from the action research undertaken (see Appendix 1 and 2 for questionnaires administered).

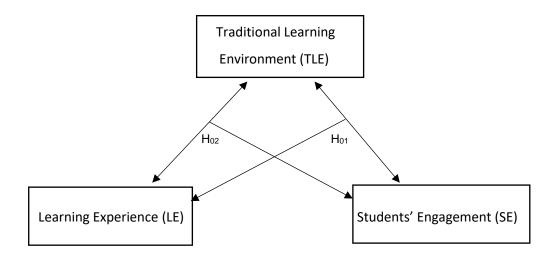

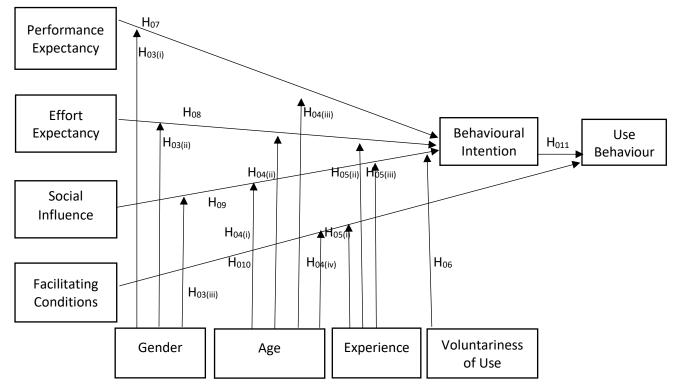

Figure 2 Unified theory of acceptance and use of technology (UTAUT) for blended learning approach

## 3.5 Research hypotheses

The research hypotheses to be tested are formulated:

 $H_{01}$  – Traditional learning environment and students' engagement are the determinants of positive learning experience.

 $H_{02}$  – Traditional learning environment and learning experience are the determinants of desired students' engagement.

 $H_{03}$  – Students' gender determines their behavioural intention towards the effective use of technology and blended learning approach.

 $H_{03 (i)}$  – Students' gender determines the performance expectancy towards the effective use of technology and blended learning.

 $H_{03 (ii)}$  – Students' gender determines effort expectancy towards the effective use of technology and blended learning.

H<sub>03 (iii)</sub> – Students' gender determines social influence towards the effective use of technology and blended learning.

 $H_{04}$  – Students' age determines their behavioural intention towards the effective use of technology and blended learning approach.

 $H_{04(i)}$  – Students' age determines the effect of social influence towards effective use of technology and blended learning.

**H**<sub>04 (ii)</sub> – Students' age determines effort expectancy towards effective use of technology and blended learning.

**H**<sub>04 (iii)</sub> – Students' age determines performance expectancy towards effective use of technology and blended learning.

 $H_{04}$  (iv) – Students' age determines the perception of students on facilitating conditions for effective use of technology and blended learning.

 $H_{05}$  – Students' work experience determines their behavioural intention towards the effective use of technology and blended learning approach.

 $H_{05}$  (i) – Students' work experience determines the perception of students on facilitating conditions for effective use of technology and blended learning.

**H**<sub>05 (ii)</sub> – Students' work experience determines effort expectancy towards the effective use of technology and blended learning.

**H**<sub>05 (iii)</sub> – Students' work experience determines the effect of social influence towards effective use of technology and blended learning.

 $H_{06}$  – Students' voluntariness of use (proxied by students' preference) determines the effect of social influence on their behavioural intention towards the effective use of technology and blended learning.

 $H_{07}$  – Students' performance expectancy determines their behavioural intention towards the effective use of technology and blended learning.

 $H_{07}$  (i) – Students' performance expectancy determines their behavioural intention to continue using IT resources and facilities to support their learning process.

 $H_{07}$  (ii) – Students' performance expectancy determines the behavioural intention of students to engage with any invention in IT to enhance their learning experience.

**H**<sub>07</sub> (iii) – Students' performance expectancy determines the behaviour of students that does not envisage limited use of IT in learning activities.

 $H_{07}$  (iv) – Students' performance expectancy determines the expectation of students to achieve their learning objectives without IT or any online resources.

 $H_{08}$  – Students' effort expectancy determines their behavioural intention towards the effective use of technology and blended learning.

 $H_{08}$  (i) – Students' effort expectancy determines their behavioural intention to continue using IT resources and facilities to support their learning process.

 $H_{08 (ii)}$  – Students' effort expectancy determines the behavioural intention of students to engage with any invention in IT to enhance their learning experience.

**H**<sub>08 (iii)</sub> – Students' effort expectancy determines the behaviour of students that does not envisage limited use of IT in learning activities.

 $H_{08 (iv)}$  – Students' effort expectancy determines the expectation of students to achieve their learning objectives without IT or any online resources.

 $H_{09}$  – Students' social influence determines their behavioural intention towards the effective use of technology and blended learning.

 $H_{09}$  (i) – Students' social influence determines their behavioural intention to continue using IT resources and facilities to support their learning process.

 $H_{09}$  (ii) – Students' social influence determines the behavioural intention of students to engage with any invention in IT to enhance their learning experience.

 $H_{09 (iii)}$  – Students' social influence determines the behaviour of students that does not envisage limited use of IT in learning activities.

 $H_{09 (iv)}$  – Students' social influence determines the expectation of students to achieve their learning objectives without IT or any online resources.

 $H_{010}$  – Facilitating conditions determine the students' use of technology behaviour towards effective blended learning.

 $H_{011}$  – Students' behavioural intention determines their end-use of technology behaviour towards effective blended learning.

 $H_{012}$  – The state of learning environment dictates the success of blended learning approach in the higher education sector.

 $H_{013}$  – The quality of instructional design is a key for achieving positive students' experience through blended learning approach.

4. Results and discussion of findings

# 4.1 Action research

The following results are from the two-cycle model of action research conducted (Muir, 2007; Mertler and Charles, 2008).

# 4.1.1 First cycle:

# 4.1.1.1 Plan

- Teaching and learning activities were planned to be undertaken based on traditional learning approach where the use of information technology was limited or absent (Dovey and Fisher, 2014).
- Learning instructions were to be given to students in the class sessions.
   Students were expected to take notes on their notebooks instead of computers, laptops, mobile or any IT gadget (Byers et al., 2018).
- iii. Assignments (in-class and homework) were to be given in the class.Students would be asked to bring back assignments in the following week

for marking. The aim was to limit the adoption of wider pedagogies that facilitate technology-enhanced learning (Dumont and Istance, 2010).

iv. Classes were arranged based on the traditional classroom layout with all students directly facing the board (Byers et al., 2018; Hidalgo-Cabrillana and Lopez-Mayan, 2018).

# 4.1.1.2 Action

- Approach of teaching adopted by a lecturer was based on a traditional teaching style dominated by class instructions, including instructions on class exercises and other learning activities during the class session (Hidalgo-Cabrillana and Lopez-Mayan, 2018).
- ii. Students were asked to limit the use of IT equipment as well as internet facilities during the class session. In spite of the fact that scholars such as Shute and Rahimi (2017) and Straub (2009) have strongly argued that incorporating the use of technology in teaching is a tool that facilitate learning, we decided to test the effectiveness of teaching without technology. Jeffrey and Craft (2004) have contrarily argued that the success of teaching depends on the ability of teachers to identify the learning abilities of students.
- iii. A pedagogy based on traditional approach of teaching was successfully implemented in the class session (Reynard, 2009).
- iv. Students' engagement was observed during the class session, and in the following week questionnaires were also administered among the students to assess their views on the traditional learning approach adopted in the past week.

# 4.1.1.3 Evaluation

- Questionnaires were administered among 44 International MBA students (30 from Asia; 9 from Europe; 4 from Africa; 1 from North America) in the cohort to evaluate their responses on the traditional learning approach adopted.
- ii. Summary of their responses has shown that 31.8 percent of the respondents strongly agree that the learning environment was conducive for learning even without the use of IT equipment. Additionally, 43.2 percent have just agreed, with 11.4 percent neutral and 13.6 percent disagreeing with the statement.
- iii. The learning experience was described as very positive by 54.5 percent of the respondents, 31.8 percent responded that it was just positive, and 13.6 percent of the respondents stated that it was not positive.
- iv. Students' engagement was also examined. From the responses, 88.7 percent of the students believed that they had the opportunity to participate in the class discussion. Seven questions were asked to assess the extent of students' engagement in the class. In addition to opportunity of participation, other areas covered in the assessment were opportunity for academic and social interaction, student-teacher interaction, collaborative learning, opportunity to learn from colleagues and motivating delivery style (McCormick et al. 2013). In all cases, over 75 percent of the students have responded positively about the key areas of students' engagement.

# 4.1.1.4 Reflection

i. The class session was observed to be remarkably successful with the observed level of students' engagement and active teacher-student interactions. On the general comment section of the questionnaire, 43.2

percent of the students have described the traditional learning approach as particularly good.

- ii. Due to the absence of the use of technology in the session, the teaching effort demonstrated in the class was characterised by teacher's innovation, control, and domination (Jeffrey and Craft, 2004). Students were only acting on given instructions.
- iii. Unsurprisingly, more than 50 percent of the students from Europe were not happy with the use of traditional approach. A particular respondent from Europe commented that:

"The lecturer prevented students from using laptops to make notes. Not very nice for people with handwriting issues, dyslexia, etc".

Another respondent stated that:

*"It was not very motivating as in this day and age, learning with technology is more interesting and I can learn better with visuals".* 

iv. However, students from Asia and Africa were clearly pleased with the traditional approach adopted. More than 60% of them commented positively about it. Some of these comments stated that:

*"I love it better than IT/slides usage". "I like that because it's kinda give me new experience". "It was perfect and more practical". "It was nice and engaging, free from distractions. I liked it".* 

v. The mixed responses received justify the implementation of the second cycle of the action research (Mertler and Charles, 2008).

# 4.1.1.5 Findings

- i. Students were very engaged during the class session. There were no distractions from the use of phones or other IT gadgets.
- It was discovered that lecturers must put-in more effort during the class session to ensure that all instructions are clear and understood by students. It was an absolute instructor-led training or session (Woodall, 2010), and results from previous studies have shown that students were more satisfied with traditional learning approach if instructions were clear (Chen and Jones, 2007).
- iii. Most of the students from the European states seem to be dissatisfied with the session based on the adopted traditional approach. The critical issue to the students was observed to be the limited use of IT facilities in the session. (Prasad et al., 2018).
- iv. Majority of the students from the African and Asian states were very satisfied with the traditional approach because of the absence of distraction from the use of personal phones or laptops. According to Ignatow and Robinson (2017), this was due to digital inequality caused by previous learning experiences which were different from that of local (European) students. The difference in learning experiences between the local and international students was explained to be due to diverse nature of social, economic, and cultural status (Myers and Klein, 2011).
- 4.1.2 Second cycle:
- 4.1.2.1 Plan
  - i. Blended learning approach was planned to be adopted in the following week after the adoption of the traditional learning approach. Students' feedback on the features of the blended learning approach will be collected from the administered questionnaires and analysed accordingly to appreciate the

impact of the two learning approaches on students' experience (see also Nazarenko, 2015).

- Both online and classroom activities will be involved in the learning process. The method will also be designed to incorporate different modes of delivery including the optimal use of resources to maximise the students' learning outcomes (Garrison, 2004; Graham, 2006).
- iii. IT facilities will be fully utilised. Specifically, the use of online learning platforms and software applications such as Moodle, Mahara, Excel and Socrative will be encouraged.
- iv. Since the components of blended learning approach consist of three elements of learning environment, instructional activities and use of media (Kaur, 2013), the learning environment will be made to reflect a conducive atmosphere that enhances optimum use of resources to attain instructional goals and learning objectives (Holden and Westfall, 2006). For this reason, the class arrangement will be changed to be in a ring-form having mini-groups of at least four students in each group to encourage collaboration and efficient use of resources among the students (Byers et al., 2018; Hidalgo-Cabrillana and Lopez-Mayan, 2018).

# 4.1.2.2 Action

- i. Prior to the class sessions, instructions on learning activities were sent to students by email, as well as placed on Moodle to encourage learning without the students having to be face-to-face with the lecturer (Kaur, 2013).
- ii. Students were instructed to make use of laptops and phones during the class sessions. Most of the lecturer's instructions were by visual tools. It was the combination of various modes of delivery, including some of the traditional learning techniques. Precisely, it involves direct lecturing, open discussions, self-learning by students, use of visual aids, use of socrative application and other online platforms such as Moodle (Khodeir, 2018).

- iii. Communication with students was based on both in-class and out-of-class feedback to ensure learning activities were undertaken irrespective of location (Khodeir, 2018).
- iv. In the use of socrative application, students were directed to download the software application on their laptops and phones. This is to provide answers to practice questions that were framed in line with the given learning objectives of the session (Guarascio et al., 2017). Group activities were also organised on the Socrative application and students participated according to the mini groups formed based on their sitting arrangement.
- v. Students were also instructed to explore Excel application in providing answers to some of the practice questions formulated.
- vi. Students were given a survey after the session to determine their preferences from the two different teaching approaches adopted and also assess the success or effectiveness of the blended learning approach.

# 4.1.2.3 Evaluation

- A survey was conducted among 38 International MBA students (26 from Asia; 6 from Europe; 5 from Africa; 1 from North America) in the cohort to evaluate their responses on the effectiveness of the blended learning approach adopted.
- ii. Students' digital learning abilities were assessed in the survey. According to the responses, 82.5 percent of the students have basic computer capabilities, 80 percent agreed they have above average computer capabilities and 57.5 percent believed that they are experts in computer knowledge. A significant proportion of the students at 65 percent have agreed that level of computer knowledge has a direct influence on their academic performance.

- iii. It was observed that students do not have confidence in the use of Moodle or Mahara as only 42.5 percent agreed that they do not need IT help in the use of the online platforms. This result has been proven by the responses of only 40 percent agreeing that they have to use Moodle to pass their modules. Up to 32.5 percent of the students have stated clearly that they do not like using Moodle.
- iv. The acceptability of the Socrative application among the students has also been assessed. The responses show that 82.5 percent of the students agreed that the application was quite easy to use. On the same note, 80 percent of the students have indicated that the use of the software application during class sessions was helpful.
- The learning experience was described as positive by 85 percent of the respondents compared to the 86.3 percent recorded on the adoption of traditional learning approach.
- vi. The responses have also shown that 85 percent of the students believed that they had the opportunity to participate in the class activities compared to the 88.7 percent recorded on the adoption of traditional learning approach. Up to 82.5 percent of the students have agreed that there was an opportunity for academic and social interactions during class sessions. And 85 percent indicated that they were motivated by the delivery style adopted during the class session.

# 4.1.2.4 Reflection

- Teachers' expertise plays an important role in the success of any teachinglearning style adopted among international students (see also Mieg, 2009; Smith and Strahan, 2004).
- Students' learning experience can be positive depending on their learning abilities and the delivery style of instructors (see also Smith and Strahan, 2004).

- iii. Digital inequality might not explain the gap in the usage of internet and IT facilities between the students from third world and developed countries as suggested by many scholars such as Ignatow and Robinson (2017).
- iv. Students across four continents of the seven continents of Asia, Africa, North and South America, Antartica, Europe and Australia as included in the survey were all very satisfied with the blended approach. There were no students from South America, Antarctica and Australia in the sample of students.
- v. Some students from Asia and Africa have commented as follows:

"I will prefer blended learning".

"It's a good way of learning approach".

"I like the approach as this develops the basics ion the subject, and it develops the passion towards subject. After that we can solve problems using any method".

*"It was a good challenge which encouraged class participation". "It was useful".* 

vi. A few students from Asia and Africa have indicated that their learning experience was better under the traditional learning approach. Some of the general comments they provided are shown below.

"There much less interaction between tutor and student. Prefer the traditional method".

*"Please leave more textbooks available in the library as it's always difficult to find the appropriate one for private study".* 

vii. Expectedly, students from Europe were also very satisfied and in quest for more of the blended approach. Some of their comments are:

"Use more Excel, isn't it?" "Mix it up".

# 4.1.2.5 Findings

- Students in higher education have different characteristics in terms of previous educational experiences, interests, expectation and readiness for learning that determine the quality of their learning experiences (see also Fry et al., 2008; Tomlinson and Imbeau, 2013; Vasileva et al., 2015; Ra ïsa nen et al., 2016).
- ii. Students were satisfied with the blended learning approach adopted irrespective of their countries of origin. This could be attributed to the integration of various teaching methods aimed at satisfying students' needs, challenging them to attaining learning outcomes in a conducive environment (see also Garrison and Kanuka, 2004; Picciano, 2009).
- iii. Students were very excited and engaged during the class session. The excitement could be because of the use of phones, laptops and learning software applications such Socrative. Another reason could be due to the age bracket of the survey respondents. Over 90 percent of the respondents were in the age bracket of between 20 and 29 years. Banerjee and Duflo (2008) have argued that young people are more likely to be engaged with technology, although, this has been contradicted by Van Dijk (2005). Chen and Jones (2007) believed that students in blended learning class were satisfied because of the perceived improvement in their analytical skills.

# 4.2 Analysis of measurement models and hypotheses testing

The summary of the data collected is presented in Table 1 and 2 below. The data was used in the analysis of the measurement models and hypotheses testing.

# Table 1

Descriptive statistics of students' responses on the traditional learning approach

Measure	Items	Frequency	Percent (%)	Cumulative (%)
Gender	Males	28	63.6	63.6
Gender	Females	16	36.4	100.0
Age	20-29 years	42	95.5	95.5
Age	30-39 years	2	4.5	100.0
Education	First degree	7	15.9	15.9
Luucation	Second degree	36	81.8	97.7
	Others	1	2.3	100.0
Eventionee		19		
Experience	<1 year		43.2	43.2
	1-2 years	12	27.3	70.5

The correlation matrix of the coefficients in the UTAUT model as presented in Figure 2 are depicted in Table 6a-c. Table 4 represents the correlation of the coefficients in triangular model for traditional learning approach presented in Figure 1.

## 4.2.1 Triangular model for traditional learning approach

The results shown below are the coefficients for the two-way multivariate regression analysis. The details of the results were provided in Table 7.

Regression analysis on the triangular model for traditional learning approach

\*TLE = Traditional Learning Environment; LE = Learning Experience; SE = Students' Engagement; ConLearnEnv = Conducive Learning Environment; LearnOut = Achieving Learning Outcomes; ClassLay = Effective Classroom Layout; SatModArr = Satisfactory Module Arrangement; PosLE = Positive Learning Experience; SLAppr = Satisfactory Learning Approach; EffLearnApp = Effective Learning Approach; IntelStimMod = Intellectually Stimulating Module; PosLE = Positive Learning Experience; ParticTS = Participatory Teaching Session; PAcadSocInt = Presence of Academic and Social Interaction; PosLearnAct = Positive Learning Activities; StudTeachInt =Satisfactory Students-Teacher Interaction; CollobLearn = Presence of Collaborative Learning; OpportLColl = Opportunity to Learn from Colleagues; DelStyleMotP = Delivery Styles Motivates Participation. Our results indicated that only the module's structure and learning approach are the determinants of students' positive learning experience. In reference to  $H_{01}$ , it suggested that the attributes of the traditional learning environment such as conducive learning environment, classroom arrangement or layout and achievement of learning outcomes have no direct relationship with students' positive learning experience. In testing  $H_{02}$ , we discovered that class layout or arrangement and students' perception of the opportunities for academic and social interaction are directly related to students' engagement. Also, student-teacher interaction and collaborative learning were found to be strongly significant.

'Gend-M1 to Mi = Gender Model 1 to ith; Age-M1 to Mi = Age Model 1 to ith; WExp-M1 to Mi = Work Experience Model 1 to ith; VUse-M1 to Mi = voluntariness of use (proxied by students' preference) Model 1 to ith; PEBasITCap = Performance Expectancy - Students possess basic computer capabilities; PEModITCap = Performance Expectancy - Students possess moderate computer capabilities; PEAdvITCap = Performance Expectancy - Students possess advanced computer capabilities; PEITKNAcadPer = Performance Expectancy - Computer knowledge directly influences academic performance; PEITHelpMoodle = Performance Expectancy - No need for IT help in the use of Moodle or Mahara; PEMoodleIRR = Performance Expectancy - Moodle is irrelevant in achieving module's pass marks; EEEasyMoodLA = Effort Expectancy - Students can easily use Moodle or Mahara in learning activities; EEMin3hrsInt = Effort Expectancy - Students spend at least 3 hours on the internet in every 24 hours; EEMuchTmInt = Effort Expectancy - Students spend a lot of time on the internet; EEMoodMahdly = Effort Expectancy - Students use Moodle or Mahara on daily basis; EEMin3hrsMoodMah = Effort Expectancy - Students spend at least 3 hours on Moodle or Mahara daily; EEDisIMoodMah = Effort Expectancy - Students do not like using Moodle or Mahara; EEEffLearnMoodMah = Effort Expectancy - Students always try to learn how to use Moodle or Mahara; EESocrAppEasy = Effort Expectancy - Socrative application; SINotUsdMoodMahPst = Social Influence - Students have never seen or used Moodle in the past; SIHelpCollonline = Social Influence - Students find it helpful to work with their colleagues online; SISeekAsstClassmAss = Social Influence - Students seek for the assistance of their classmates when submitting assignments on Moodle or Mahara; SIMentAsstMoodMah = Social Influence - Students have mentors that assist them in using Moodle or Mahara; SIPersLaptop = Social Influence -Students have personal laptops for their studies; SIMostClassLaptop = Social Influence - Most of the students' classmates have personal laptops for their studies; SIPartCommStaffStd = Social Influence - Students feel part of the community of staff and students; FCNotUsdMoodMahPst = Facilitating Conditions - Students have never seen or used Moodle in the past; FCHelpCollOnline = Facilitating Conditions - Students find it helpful to work with their colleagues online; FCSeekAsstClssmaMood = Facilitating Conditions - Students seek for the asisstance of their classmates when submitting assignments on Moodle or Mahara: FCPersTutAssITIssues = Facilitating Conditions - Personal tutors assist students in addressing IT issues: FCPartCommStaffStd = Facilitating Conditions - Students feel part of the community of staff and students; FCLibResAvailSuppLrn = Facilitating Conditions - Library resources are always available to support students learning; FCMoodMahWellOrg = Facilitating Conditions - Moodle and Mahara sites are well-organised and work smoothly to support students' learning; FCCondLearnEnv = Facilitating Conditions - Learning environment can be described as very conducive for learning; FCSocAppHelp = Facilitating Conditions - Students find the use of Socrative Application in the class very helpful; BIContUsgITResLearn = Behavioural Intention - Students intend to continue using IT resources and facilities to support their learning process; BIEngInvITEnhLE = Behavioural Intention - Students are happy to engage with any invention in IT to enhance their learning experience; BINotEnvLmtITLA = Behavioural Intention - Students do not envisage limited use of IT in learning activities; BIAchLearnObjWtoutIT = Behavioural Intention - Students can achieve their learning objectives without IT or any online resources.

The results of the unified theory of acceptance and use of technology model are presented in Table 8. In most cases, students' gender was insignificant in the determination of their behavioural intention towards the effective use of technology and blended learning approach. There was also no evidence that gender determines the state of their performance expectancy, effort expectancy and social influence. However, we found a positive relationship between gender and students' perception on the relevance of the use of Moodle in achieving module's pass mark.

We tested H<sub>04</sub> to assess whether age group is a significant factor in the determination of behavioural intention, social influence, effort expectancy, performance expectancy and facilitating conditions towards the effective use of technology and blended learning

approach. We found some evidence of relationship in effort expectancy, performance expectancy and the perception of students on facilitating condition. In effort expectancy, the easy use of Moodle was found to be determined by students' age group. The extent of how students try to develop expertise on the use of Moodle was also by their age group. In performance expectancy, the possession of basic computer capabilities was determined by age group. We found a strong correlation between students' age and their perception on the relevance of facilitating conditions for effective use of technology and blended learning.

We tested the influence of students' work experience on their behavioural intention towards the effective use of technology and blended learning approach. There was no evidence of relationship except in collaborative learning and the usefulness of Socrative application. We found a positive relationship between students' work experience and their effort towards collaborative learning and the acceptance of the importance of learning software applications such as Socrative. Based on H<sub>06</sub>, we found no evidence to suggest any relationship between students' voluntariness of use proxied by their preference and the effect of social influence on their behavioural intention towards the effective use of technology and blended learning.

The testing of H<sub>07</sub>, H<sub>08</sub> and H<sub>09</sub> was to assess whether performance expectancy, effort expectancy and social influence have effects on the students' behavioural intention towards the effective use of technology and blended learning. From the numerous sub-hypotheses tested, we found that most students possess basic computer capabilities and do not expect IT help in the use of Moodle to achieve learning objectives. Surprisingly, the sub-hypothesis of Moodle irrelevance in achieving module's pass mark (H<sub>07(iii)</sub>) was found to be significant. Students believe that learning objectives and pass mark can be achieved without the use of Moodle. We have not investigated further to find factors behind this finding. Our results have also indicated the significance of having easy access to Moodle (H<sub>08 (ii)</sub>); spending at least 3 hours on the internet in every 24 hours, using Moodle or Mahara on a daily basis, and the relevance of Socrative application in learning activities (H<sub>08 (ii)</sub>). Social influence was also found to have effect on students' behavioural intention towards effective blended learning in the areas where students have never seen or used Moodle in the past (H<sub>09</sub>

36

(iii)), students are seeking for the assistance of their classmates when submitting assignments on Moodle or Mahara; most of the students' classmates have personal laptops; and students feel part of the community of staff and students (H<sub>09</sub> (ii)). Students were also found to have mentors that assist them in using Moodle and Mahara facilities.

We have also tested whether facilitating conditions such as conducive learning environment and adequate library resources are factors that determine students' use of technology behaviour towards effective blended learning. The results of our analysis show that only the use of Moodle and the assistance offered to students by tutors in addressing IT issues are significant in the influence of their use of technology behaviour towards effective blended learning. However, students' enthusiasm to engage with any innovation in IT has been found to be relevant in the determination of use of technology behaviour towards effective blended learning. We found no evidence to suggest that the state of learning environment using proxies such as classroom layout and conducive atmosphere for learning dictates the success of blended learning approach. Contrarily, the quality of instructional design in terms of the availability of library resources and the coordination of Moodle and Mahara are key factors for achieving positive students' experience through blended learning approach.

## 5. Conclusion

Action research was undertaken to reassess the effectiveness of a blended learning approach among the International MBA students at Birmingham City University. It was discovered that students were very engaged during traditional learning session with no distractions from the use of phones or other IT gadgets. Most of the students from the European states seemed to be dissatisfied with the session. The critical issue to the students was observed to be the limited use of IT facilities in the session. Contrarily, majority of the students from the African and Asian states were very satisfied with the traditional approach because of the absence of distraction from the use of personal phones or laptops. It was also discovered that students in higher education have different characteristics in terms of previous educational experiences, interests, expectation and readiness for learning that determine the quality of their learning experiences. Students were satisfied with the blended learning approach adopted irrespective of their countries of origin. On the same note, students were very excited and engaged during the blended learning session. The results show a significant relationship between age and students' performance expectancy, effort expectancy and facilitating conditions. Although, the majority of the respondents are within the age bracket of 20 to 29, we found evidence that the younger the students the more important those factors will be in facilitating their effort to associate with technology for successful blended learning. It also indicates that students' engagement is determined by positive learning experience. In particular, wellorganized module structure and learning approach are the key factors responsible for positive learning experience. Students' gender coefficients were found to be insignificant with regard to performance, effort, social influence and other facilitating conditions that determine students' engagement with technology towards effective blended learning.

Areas of further research could be in assessing students' engagement and experience regarding alternative learning methods that could be incorporated into the blended learning approach. These learning methods include open discussions, self-learning presentations and posters, storytelling, real-life case studies, guest lectures and game-based learning. It will also be meaningful to explore further the impact of students' economic, social and cultural background on their learning achievements. The acceptability of different online learning resources and software applications among international students should be investigated.
