SOIL TEMPERATURES
IN THE TERTIARY REGION
OF CENTRAL AMAZONIA

II. CLEARED WHITE SAND AREAS

W. L. Brinkmann, M. N. Goes Ribeiro and J. B. Pate.

Temperaturas do solo na região Terciária da Amazônia Central

II. Areias brancas e roçados *

W. L. F. Brinkmann, ** M. N. Góes Ribeiro ** e J. B. Pate ***

A temperatura do solo é fator importante para a vida vegetal.

Fator crítico para a germinação, o desenvolvimento de raízes, a absorção e a eliminação de nutrientes a temperatura ainda influencia a capacidade do solo reter água, a atividade e abundância de microorganismos fotossintéticos e não fotossintéticos no "litter".

Ainda não havia observações de longa duração sobre a temperatura do solo na Amazônia. Cientistas do INPA e do NCAR, num esforço conjunto, resolveram preencher a lacuna.

A permuta de calor entre as diversas camadas do solo, i.e. os mecanismos físicos dos vários processos energéticos no solo, não são discutidos no presente trabalho, já que uma avaliação detalhada da temperatura em vários tipos de solo da Amazônia Central constitue assunto de outro trabalho em conclusão (1).

As temperaturas do solo foram registradas simultaneamente a três profundidades diferentes, utilizando-se um termógrafo registrador à distância munido de três sensores e localizado a 120 cm do solo, num abrigo especialmente desenhado.

* Este é o segundo de uma série de estudos sobre o solo da Amazônia, executado pelo Laboratório de Fatores Ambientais do Instituto Nacional de Pesquisas da Amazônia, dentro do Programa Integrado de Pesquisas Florestais, financiado pelo BNDE, Banco Nacional de Desenvolvimento Econômico, Contrato FUNTEC 89/70.

** Do Instituto Nacional de Pesquisas da Amazônia, órgão do Conselho Nacional de Pesquisas.

Soil temperatures in the Tertiary region of central Amazon.

II. Cleared white sand areas.

W. L. F. Brinkmann,* M. N. Góes Ribeiro * and J. B. Pate. **

Soil temperatures are an important factor in plant life. They are a critical factor for germination, root development or nutrient uptake and release of various cultivated crops and plants. They are closely related to soil water capacity and partly control the activity and abundance of photosynthetic and non-photosynthetic microorganisms in the soil and litter layers.

Up to 1969, long-term soil temperature measurements were not available for the Tertiary region of central Amazonia neither for natural forest sites nor for clearcut areas. This challenge was answered by INPA/NCAR scientists in a joint effort with the present set of soil temperature data. Heat exchange between different soil layers, i.e. the physical mechanisms of various energetic processes in the soil were not discussed in this paper, because a detailed evaluation of soil temperatures of various central Amazonian soil types is under way (1).

Soil temperatures were recorded simultaneously for three different depths by a remote recording three point thermograph set up in a special designed instrument shelter at about 120 cm above the forest floor.

The temperature sensors are mercury filled bulbs encased in brass probes with capillary connection to the instrument.

* Instituto Nacional de Pesquisas da Amazônia (INPA), MANAUS, Amazonas, BRASIL (INPA is sponsored by the National Research Council of Brazil).

** National Center for Atmospheric Research, Boulder, Colorado, U.S.A. (NCAR is sponsored by the National Science Foundation).

Os sensores utilizados são a mercúrio, encastoados em sondas de bronze e com comunicação capilar com o termógrafo. As sondas são "temperature compensated". Todo o sistema capilar é protegido com tubulação plástica para reduzir ao mínimo a corrosão. Sómente são registradas as temperaturas das sondas.

A calibração do termógrafo, executada em laboratório antes do início dos trabalhos, foi revisada cada três meses utilizando-se para comparação um jôgo de termômetros de solo convencionais. A precisão obtida foi da ordem de mais ou menos 0,3°C durante todo o período da experiência.

A temperatura do solo foi registrada a três profundidades (20 - 40 cm); (40 - 60 cm); (60 - 80 cm), estando as sondas colocadas verticalmente. O termógrafo estava equipado com tambor fazendo revolução completa em 7 dias.

O perfeito contato das sondas com o solo foi garantido pelo reenchimento do orifício em torno da sonda com o solo retirado pela broca, umedecido e bem apertado. As medidas foram iniciadas duas semanas após a instalação das sondas.

Temperaturas do solo foram registradas no Km 18 da rodovia Manaus-Itacoatiara no declive de uma chapada (roçado).

A quatro anos passados a mata primitiva desta área (solo de areia branca) foi cortada e queimada, iniciando-se aí uma plantação de abacaxi que não chegou a se desenvolver. Dois anos após a queima foi iniciada uma plantação de coqueiros apresentando na presente data um incremento extremamente baixo, estando no momento a região coberta por uma mata secundária (capoeira) que possui como espécie dominante a imbaúba (*Cecropia* spp.), atingindo alturas que variam de 2 a 4 metros. O solo da área estudada foi classificado como areia branca profunda semelhante aos podsolos gigantes descritos para uma área próxima (2).

Na superfície as areias são impregnadas com partículas de carvão vegetal resultante da queimada.

The probes are temperature compensated. Additionally, the capillary systems were protected with plastic hoses to reduce corrosion to the very minimum. Only probe temperatures are recorded. The thermograph was laboratory calibrated before exposure. Every three months, the calibration was adjusted by means of a set of soil thermometers. The accuracy obtained was in the order of about 0.3°C over the period of measurements.

Soil temperatures were recorded for three depths (20 - 40 cm; 40 - 60 cm and 60 - 80 cm) with temperature probes exposed vertically operating with a 7-day drum rotation. Direct soil contact of the probes was guaranteed by tightly fitting boreholes, which were closed after exposure with washed-in soil from the auger blade. After a two weeks settling, the thermograph was put into operation.

Soil temperatures were recorded near Km 18 of the Manaus-Itacoatiara Road on a slightly inclined hill slope. The site was a so-called roça (cleared area). Four years earlier, the forest, a natural climax forest on poor white sands, was slashed and burned. There was some pineapple cultivation, but the agricultural effort failed. Two years ago, coco palms were planted. The incrementation of the plantation is extremely poor.

Today, the hill slope is completely covered with a secondary forest, which is dominated by 2 m - 4 m high Imbaúbas (*Cecropia* spp.). Soils were classified as deep white sand layers somewhat similar to giant podzols, described for a nearby area (2). The surface layer is impregnated with charcoal particles as a result of early burning. This particular soil type is approximately representative for about 0.5 to 1.0 percent of the Tertiary region along the Manaus-Itacoatiara Road.

Aquêle tipo de solo é representativo para 0,5 - 1,0 por cento para todos os solos da região da Estrada Manaus-Itacoatiara.

Análises mecânicas do solo (média de três análises de cada profundidade) como segue :

Profundidade	Areia (cm)	areia muito fina (> 0.2 mm)	argila (0.2 - 0.002mm)
20 — 40	96 %	4 %	—
40 — 60	95 %	4 %	1 %
60 — 80	84 %	10 %	6 %

1) Textura conforme classificação internacional de Atterberg.

Os registros de temperatura foram removidos cada 7 dias. Foram anotadas as temperaturas registradas cada duas horas e a tabulação foi executada no INPA. Dados tabulados foram remetidos ao NCAR para perfuração em cartões e computação. O termógrafo utilizado em virtude do convênio entre o Conselho Nacional de Pesquisas e o Instituto Max Planck para Limnologia, Ploen, pertence ao Departamento de Ecologia Tropical daquele Instituto.

Mechanical soil analyses (average of 3 subsamples each) was as follows :

soil depth (cms)	sand (> 0.2 mm)	silt (0.2 - 0.002 mm)	clay (< 0.002mm)
20 — 40	96 %	4 %	—
40 — 60	95 %	4 %	1 %
60 — 80	84 %	10 %	6 %

1) Texture according to the international Atterberg Classification.

The recording charts were reset every 7 days. Soil temperature data were evaluated in two hourly intervals over the period of measurements and tabulated at INPA. The tabulated raw data were key punched and computerized at NCAR. The thermograph was supplied by the Max Planck Institute for Limnology, Department of Tropical Ecology, Ploen. The research effort was granted by the Banco Nacional de Desenvolvimento Econômico under contract INPA/FUNTEC 89/70.
