20

21 In paragraph [47] of *Woodworth et al.* [2010] we adopted a value of -0.52 mm/yr for the estimated

22 rate of present-day sea level change in the Falkland Islands due to glacial isostatic adjustment

23 (GIA). This value was used to remove the contributions of GIA to our measurements of historical

24 and recent rates of sea level change. However, it was based on a mis-reading of the data file of

25 *Peltier* [2004] on the Permanent Service for Mean Sea Level web site

26 (http://www.psmsl.org/train_and_info/geo_signals/gia/peltier). More reasonable values to apply to

27 the observed changes since the mid-19th century and in recent years would be -0.69 and -0.61
28 mm/yr respectively. Consequently, the long-term rate of sea level change between 1842 and the
29 early 1980s, after correction for air pressure effects and for GIA, reported as $+0.75 \pm 0.35$ mm/yr
30 in paragraphs [1,47,55,61] should be $+0.92 \pm 0.35$ mm/yr, the corresponding rate between 1842 and
31 the mid-point of recent data of 1.06 ± 0.22 mm/yr in paragraphs [48,55] should be 1.23 ± 0.22
32 mm/yr, and the corresponding rate since 1992 reported as 2.51 ± 0.58 mm/yr in paragraphs [1,52]
33 becomes 2.60 ± 0.58 mm/yr. The middle of paragraph [63] becomes “The Stanley data suggest that
34 the rate of change of sea level in East Falkland since 1992 has been approximately 2.6 mm/yr, a
35 rate supported by information from satellite altimetry.” These small GIA model corrections have no
36 bearing on the main findings of our paper on the difference in the rates of sea level change between
37 the historical (1842 to present day) and recent (last two decades) epochs.
