Correction: How Do People Become W.E.I.R.D.? Migration Reveals the Cultural Transmission Mechanisms Underlying Variation in Psychological Processes

Alex Mesoudi, Kesson Magid, Delwar Hussain

There is an error in [Table 4](#). [Table 4](#) contains a row for the measure “Closeness”. The mean (standard deviation) value of “4.18 (1.79)” for the column “1st gen” and “4.93 (1.87)” for the column “Non-migrants” are swapped. The Non-migrants column should be “4.18 (1.79)” and the 1st gen column should be “4.93 (1.87).”

Table 4. Summary of culture-only means and regression coefficients. Means and standard deviations are raw values before transformation. Unstandardised regression coefficients estimate the difference denoted in the column heading, with 95% confidence intervals in square brackets. Note that in the regressions several measures are logged, and some models are non-linear (see text for details), so coefficients should not be compared across models/measures. Differences comprising CIs that do not cross zero are shown in bold. 1st gen = 1st generation British Bangladeshi, 2nd gen = 2nd generation British Bangladeshi. For categorisation, higher values indicate holistic cognition, lower indicate analytic.

Measure	Mean (sd), before transformation			Unstandardised regression coefficients [95% CI] on group differences		
	1 st gen	2 nd gen	Non-migrants	1 st gen - 2 nd gen	1 st gen-non-migrants	2 nd gen-non-migrants
Individualism	5.25 (0.82)	5.13 (0.83)	4.98 (0.95)	0.05 [-0.06, 0.15]	0.08 [-0.02, 0.19]	0.04 [-0.07, 0.15]
