

The background of the cover is a fluorescence microscopy image of Ewing sarcoma cells. The cells are stained with a green fluorescent marker, likely highlighting the nucleus or a specific protein. Some cells also show red fluorescence, possibly indicating a different marker or a specific cellular component. The cells are arranged in a somewhat organized pattern, with some showing distinct nuclei and others appearing more clustered. A dashed white line with small circular markers at intervals traces a path across the image, starting from the top left, curving around the text box, and continuing down the right side and bottom left. The overall image is dark, with the green and red signals providing the primary visual information.

# Chemokines in Ewing sarcoma
