PREFACE

This volume was created as a supplement to the report, *Education and Greenwood County: A Benchmarking Tool*. It contains data compiled by the authors for use in analyzing the 86 school districts in South Carolina. Sources of the data include the South Carolina Department of Education (SDE) and the United States Census Bureau, among others. Specific bibliographical references are listed in the back of this volume.

Some of the data included in these pages involve calculations performed by the authors for the purposes of the report and therefore do not occur in any other document. The most significant portion of this data consists of the performance indices, which were calculated in order to compare the academic performances of South Carolina school districts on many standardized tests at once. All of these calculations are reproducible, and explanations of the indices are given in the appendix to this volume.

The sheets that follow contain data from different fiscal and calendar years. An effort was made to use the most recent data, but the latest data available from different sources did not always coincide. In general, the latest academic performance data are from the 1997-98 school year, while the revenue and expenditure data are from the 1996-97 fiscal year. The notes to this volume detail this information and can be found in the back.

Adjustments were made to 1996-97 school district finances in Greenwood and Orangeburg counties. Spending shares in Greenwood 50 and 51 in 1996-97 were adjusted to correct accounting misallocations identified after financial data from those districts were reported to the SDE. Total 1996-97 expenditures and debt service remain unchanged, but dollars for general operations were distributed to the four remaining spending categories—instruction, instructional support, operations, and leadership—based on their shares in 1997-98. For this reason, per pupil spending detail presented on these sheets for Greenwood 50 and 51 differ from that reported in SDE reports such as *In\$ite*.

The 1997-98 school year was the first year in which Orangeburg County had three consolidated school districts; prior to that time the county had eight. The SDE recalculated academic performance data for the three new districts for five years preceding 1997-98. However, the latest financial data was available for 1996-97, when the eight districts still were separate. In this volume, the 1996-97 finances and pupils of the eight districts were added together to approximate the finances of the three new consolidated districts. Because of these two data adjustments, the state medians on education finance listed on these sheets differ from those published by the SDE.

NOTES

County Level Demographic Data

a. Per capita personal income is from October 1995. Net migration is measured over the years from 1990 to 1997. The percentage of population over 65 and private school enrollment are from 1997. The unemployment rate, percentage of the labor force employed in manufacturing, teen pregnancy rate, and crime rate are all from 1996. The educational attainment of adults over 24 is from the 1990 decennial census.

District Level Demographic Data

b. Average daily membership, percent African American, and percent other minority are from the 1997-98 school year. The percentage of students eligible for free or reduced lunches is from October 1997. The percentage of children aged 5 to 17 that are below the poverty line is from 1996.

District Classifications

c. The district size classification is based on the 1996-97 student population of the district. Aiken, Anderson, Florence, Greenville, Lexington, Spartanburg, and York counties are considered by the Greenwood Partnership Initiative to be economic development competitors with Greenwood County. There are 28 school districts in these counties. South Carolina school districts are classified as having one of three different levels of fiscal authority: none, limited, and full.

Academic Performance & Other Characteristics

- d. Unless otherwise noted, academic performance data in this section consist of five-year averages from the 1993-94 school year to the 1997-98 school year.
- e. MAT7 data consist of four-year averages from the 1994-95 to 1997-98 school years.

Expenditures, Revenue & Tax Effort

f. Unless noted otherwise, all of the data on the second page for each district is from the 1996-97 fiscal year.

APPENDIX: ACADEMIC PERFORMANCE INDEX CALCULATION METHODS

The methods by which the academic performance indices were calculated are outlined below. While examining the performance index scores, readers should keep the following points in mind:

- No two different indices can be directly compared. To examine the performance of a district on different tests, each index must be compared to its state or group average or median. The district's performances relative to the state or group can then be compared across tests.
- None of the indices are perfect indicators of academic performance. It is impossible to perfectly characterize performance across different tests and subtests with one simple score. The indices are useful because of their simplicity in describing overall performance.
- The numerical index scores only have merit as relative measures of standardized test performance. Low and high scores do not represent the relative worth of the students or the values of the districts.
- Because of the imperfect nature of the indices, districts with similar scores should be regarded as equivalent performers. The wider the range of scores, the more confident one can be that the districts are different.

Cognitive Skills Assessment Battery (CSAB) Index

The CSAB index is a five-year average of the percentage of first grade students in the district meeting the readiness standard.

Basic Skills Assessment Program (BSAP) Index

The index for the BSAP is a general representation of the percentage of students passing the different sections of the exam in all grades in which the exam is given. The BSAP index averages the percentages passing each individual subtest (math, reading, science, writing) within each grade (3rd, 6th, 8th, 10th), and then averages across the grades within each year. The final step averages across the five years. This index is not meaningful as a percentage because it represents an average over many different subtests. No differential weighting of different subtests or grades is used in computing the index. In other words, 50% passing the math section of the 8th-grade BSAP in 1997 is equivalent to 50% passing the 3rd-grade science section in 1995.

Metropolitan Achievement Test, Seventh Edition (MAT7) Index

The index for the MAT7 is slightly more complex than the indices for the CSAB and BSAP, because exam results are reported as percentages of students scoring in quartiles of the distribution of scores from a nationwide sample. The four quartile percentages are reported for each of three subtests (language, math, and reading), and so 12 percentages (3 subtests by 4 quartiles) appear for each of the 5 grades in which the test is administered. That equals 60 numbers per year over four years, or 240 numbers, all summarized in one neat MAT7 index! Because it is based on percentages, this index ranges in value between 0 and 100.

The MAT7 index is calculated by weighting the quartile percentages. A percent in the lowest quartile gets a weight of 0.25, second quartile gets 0.50, third quartile gets 0.75, and the fourth quartile gets a weight of 1.0. This weighting gives a single number for each subtest, which is then averaged across subtests, across grades, and across years. Because it is based on percentages, this index ranges in value between 0 and 100.

Scholastic Assessment Test (SAT) Index

The SAT performance index is somewhat different from those for the other tests. This index takes into account the percentages of students taking the test as well as their average test scores. The idea behind the index is that it is unfair to assume that a district with a high average SAT but relatively few students taking the test is superior to a district with a slightly lower average SAT but many more students taking the test.

The SAT index was calculated by starting with the average total score (math + verbal) and adding a component determined by the percent taking the exam in the district. Specifically, the 'percent-taking component' was calculated using a two-step process:

- 1. A regression analysis was performed in which each district's total SAT score was explained by its scores on the ninth and eleventh grade MAT7 exams, the Exit Exam, and the percentage of students taking the SAT. Over 91 percent of the variation in total SAT scores across districts was explained by this model. Furthermore, the effect of a higher percentage taking the exam was determined to be negative. (The coefficient on the percentage of students taking the test was negative.)
- 2. The negative effect of having a higher percentage of students taking the exam was added back to the original total SAT scores. The amount to be added back was simply the percent taking the exam multiplied by the absolute value of the coefficient on percent taking estimated in the regression.

This type of methodology creates what is called a "corrected" SAT score. The correction refers to the filtering out of the percent-taking effect. In other words, by using the corrected scores, the playing field is leveled so that the districts can be compared directly. The purpose of using this method is to eliminate the possibility of a district with high SAT scores and relatively few students taking the exam being ranked above a district with a slightly lower SAT score, but many more students taking the exam. The SAT index is adjusted so that the highest score equals 100.

Total Academic Performance Index

An index to describe the overall academic performance of school districts was created. This index is simply a weighted average of the components of the individual exam indices, where slightly greater weight is given to scores on tests taken in later grades. The idea is that later test scores are representative of a greater cumulative experience in the school district. The older students have had more exposure to the educational system so it is assumed that their later school performances are more likely to have been influenced by the system than younger students.

The Total Academic Performance Index has 10 components. The 3rd- and 6th-grades BSAP and 4th- and 5th-grades MAT-7 each get weights of 7.5% each. The 7th-grade MAT-7 and 8th-grade BSAP get 10% weights, and the 9th- and 11th-grades MAT-7, High School Exit Exam, and SAT performance index each get 12.5% weights. The sum of the weights is 100%. Like the SAT index, the total academic performance index is adjusted so that its value in the highest-ranking district equals 100.
