Executive Summary

This study analyzes the impact that projected population growth in Berkeley County, South Carolina will have on the general fund revenue and expenditure stream of the Berkeley County School District (BCSD) through the fiscal year ending in 2035. The models, which combine the REMI PI⁺ model with our own Fiscal Impact Analysis Tool, are based upon population projections provided by the South Carolina Revenue and Fiscal Affairs Office (RFA). RFA projections were used as a baseline in all of the models run in this study; sensitivity analyses were done by adding and subtracting five percent from the RFA projected population in each year after 2015. A second model was run to estimate the impact of the announced location of the Volvo automotive plant in Berkeley County on population and property values, which provide the basis of the fiscal impact analysis.

The analysis indicates that the fiscal position of BCSD is strong in each of the scenarios based upon the RFA population projections. The district's fiscal position is more dependent upon the recovery of unused mills for the three years preceding 2015 in the scenario incorporating population impacts from the new Volvo plant.

In addition to projecting revenue and expenditure streams, this study projects the need for the construction of new schools in response to student-age population growth through 2035. School construction projections include a sensitivity analysis of plus and minus 5 percent of projected population growth. The growth in population will require the construction of facilities in addition to those currently planned beginning as early as 2021 in the models incorporating the effects of the Volvo plant. Because the Volvo plant is projected to create substantial economic migration to the county over and above the growth projected by the RFA baseline, expenditures on school construction are expected to grow more rapidly as the years progress toward 2035.

Finally, this study estimates debt service costs associated with projected school construction, taking into account current outstanding debt and debt retirement. Total annual debt cost is projected to be approximately \$95.6 million by 2035 under the scenario including impact from the Volvo plant.

This Page Intentionally Left Blank

I. Introduction

This study estimates the impact of population growth in Berkeley County, South Carolina on future revenue and expenditure streams of the Berkeley County School District (BCSD). A sensitivity analysis was performed using a baseline county population projection plus and minus five percent. A parallel analysis also was conducted to factor in the additional county population growth expected as a result of the construction and operation of a new Volvo automobile manufacturing plant. Volvo's selection of Berkeley County for its next U.S. facility was announced after this study was underway. Future BCSD general fund revenues and expenditures were estimated using the Clemson University Regional Economic Analysis Laboratory's (CU-REAL) Fiscal Impact Analysis Tool in conjunction with county economic impact estimates generated by the Regional Economic Models, Inc. (REMI) PI⁺ modeling engine.

In addition to the fiscal impact analysis, this study also examines the effect of population growth on the demand for new school construction. Because the population projections report population growth in age cohorts, the need for additional school facilities was estimated according to type of school: primary, middle, and high school. The estimated construction cost of each school facility was then used to project the cost of financing the new construction through the issuance of bonded indebtedness. As in the fiscal impact analysis, this study considers a baseline school construction cost projection without the Volvo plant and a modified projection including Volvo's anticipated impact on county population growth and the demand for school facilities.

II. Methodology

A. Fiscal Impact Analysis

The fiscal impact analysis of population growth on BCSD general fund revenues and expenditures was carried out in two stages. First, the economic impact of population growth on the value of residential and nonresidential capital stock in Berkeley County was estimated using the REMI model. Second, these capi-

tal stock projections, along with county population projections, were input into CU-REAL's Fiscal Impact Analysis Tool to generate estimates of future BCSD general fund revenues and expenditures. A separate fiscal impact analysis examines the impact of the Volvo plant construction and operation on projected BCSD revenues and expenditures.

Population projections. The fiscal impact of population growth on BCSD's finances was estimated using three population growth scenarios: the original baseline projections, a "low" projection which reduced the baseline by five percent beginning in 2016, and a "high" projection which increased the baseline by five percent beginning in 2016. In this study, we used population projections generated by the South Carolina Revenue and Fiscal Affairs Office (RFA) by five year age cohort for the years 2013 to 2035 rather than the population projections internal to the REMI model.

County capital stock. The REMI model was used to generate annual estimates of the future value of capital stock in Berkeley County. The REMI model uses input-output (IO) modeling as well as computable general equilibrium (CGE) and econometric modeling to project a baseline of economic activity for a region. Berkeley County, SC is the region in this study. Economic impact estimates generated by the REMI model are driven by projected population growth and include total employment and the dollar value of total compensation, gross domestic product (GDP), and output.

Projected revenues and expenditures. The RFA population projections for Berkeley County and the REMI model estimates of future county capital stock were input to CU-REAL's Fiscal Impact Analysis Tool to generate projected BCSD general fund revenues and expenditures. The Fiscal Impact Analysis Tool is fully customizable. For this study, we configured it using historical general fund revenues and expenditures from Schedule A-2 in BCSD financial statements dating from FY 2006 through FY 2014.¹

1. For simplicity, this study will state dates in terms of calendar years in lieu of fiscal years.

This financial data is the starting point for our revenue and expenditure projections. It also provides valuable information on revenue trends and levels per pupil. For modeling purposes, revenues and expenditures from each year's financial statement were converted to real (inflation-adjusted) 2014 dollars, and all projections are made in real dollars.

BCSD general fund revenue sources considered include: ad valorem (property) tax for school operations, other local revenue, Education Finance Act (EFA), state revenue in lieu of taxes, other state revenue, and transfers to the general fund from the Education Improvement Act (EIA) fund. Most federal funding received by school districts is excluded from the general fund and is not included in these revenue projections.

Operating expenditures for all BCSD schools (existing and future) were estimated using the RFA projected population cohorts most closely associated with the age of school pupils. For elementary and middle schools, these are the 5 to 9 year-old age cohort and the 10 to 14 age cohort, respectively. Operating expenditures for new high schools were estimated using the RFA 15 to 19 year old age cohort, adjusted by REMI single-year age cohort population estimates to more closely reflect the traditional high school age group of 15 through 17. Because this adjustment departs from the RFA population projections used in this study, it was only made for the high school age cohort. Operating expenditures for the average new elementary, middle or high school were based on per pupil school operating cost data from BCSD.

A summary of the methodology for projecting BCSD revenue and expenditures is presented in Appendix Table 1.

B. School Facility Construction and Debt Schedule

BDSC's recent School Improvement Referendum approved construction of nine new schools between 2015 and August 2018, plus additions and renovations to some existing facilities. These capital projects are assumed to alleviate the existing and expected overcrowding for that time period. They do

not, however, plan for population growth far beyond 2018, including that now expected with construction and operation of the new Volvo plant. This study contains two estimates of the impact of population growth on BCSD school construction and debt service beyond 2018: one using RFA's baseline county population projections, and one with the added population expected to accompany the new Volvo plant.

Given BCSD's current construction schedule, we assume that in 2018 all schools will be under or at capacity and that each will have some flexibility over full capacity to accommodate new students. Each type of school (elementary, middle and high) has different average capacity levels, with the elementary schools being the smallest and high schools the largest. Within the district there are significant differences in capacity, even between the same type of school. For example, the capacity of J. K. Gourdin Elementary School is 256 students while the capacity for Devon Forest Elementary School is 900 pupils.

For consistency in facility planning beyond 2018, we used the national average school size in 2010 from the National Clearinghouse for Educational Facilities' Construction Report: 600 pupils for elementary schools, 936 pupils for middle schools, and 1,600 pupils for high schools. Estimated construction costs for elementary, middle, and high schools were provided by BCSD. We also assumed that each school will accommodate over 110 percent of capacity as the school age population grows and new schools are being built and/or existing schools enlarged or renovated. This study does not consider the location of existing or planned schools within the county.

Next, the estimated cost of school construction beyond 2018 was used to estimate additional annual debt service cost to the district. Construction costs for each year in which new school facilities are predicted were input to a bond payment calculator assuming a 20 year term and a five percent coupon rate. The calculator returned the portion of the issuance cost that may not be financed and the monthly bond payment that BCSD could expect. Each year's total debt service cost projection includes the sum of each of the new and outstanding debt plus any issu-

ance costs incurred in that year. These totals take into account existing and planned debt costs already in existence at the time of the writing of this report, and account for the retirement of existing debt over time.

Part 1: School Finance and Facility Estimates based on RFA Projections

III. Fiscal Impact Analysis

A. Model Inputs

The fiscal impact of population growth on BCSD's general fund revenues and expenditures were estimated using two population growth scenarios: a "low" projection which reduced the RFA projections by five percent beginning in 2016, and a "high" projection which increased the RFA projections by five percent beginning in 2016.

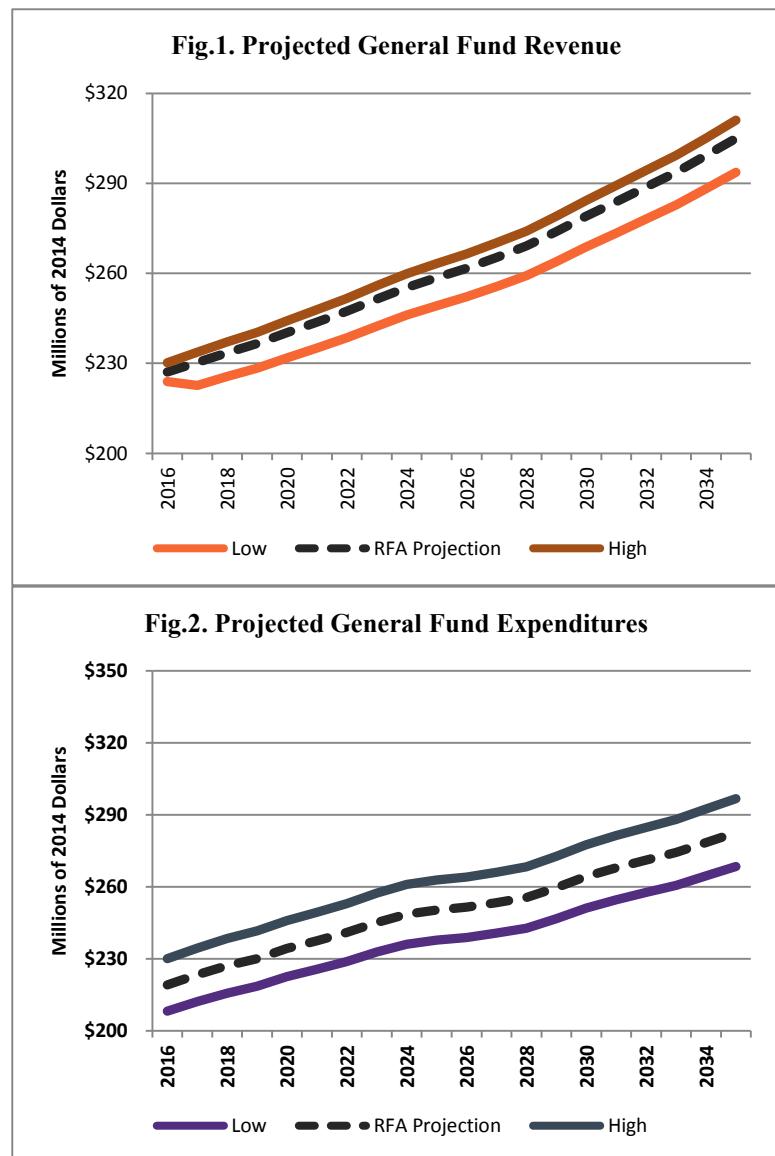

In order to raise additional property tax revenue beginning in FY 2016, BCSD also has the opportunity under state law to recover "unused" operating mills for the preceding three years. (State law in South Carolina limits annual millage increases.) BCSD did not use 12.3 mills of authority between 2013 and 2015, so this amount is available to add to its current mill rate of 149.2. Our revenue projections include net totals both with and without the additional property tax revenue projected to be raised by recovering these mills.

B. Findings

Figures 1, 2, and 3 show projected BCSD revenues and expenditures between 2016 and 2035 resulting from the two population scenarios.

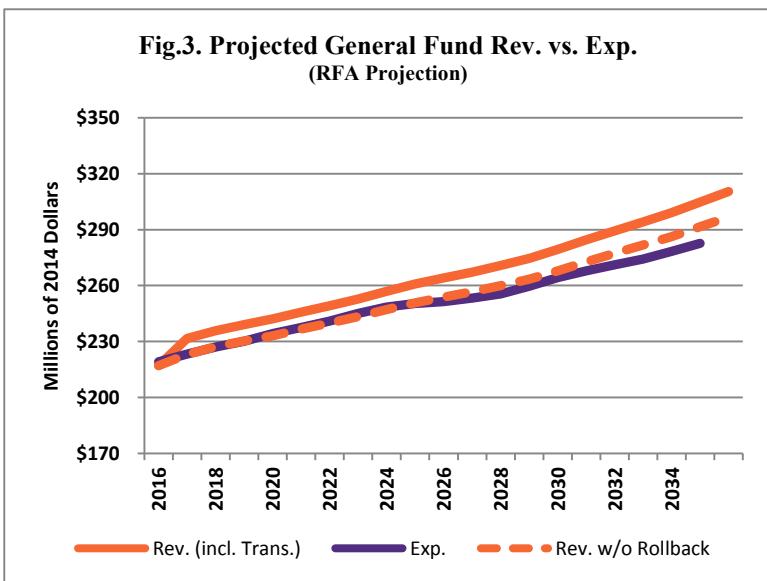

Projections using the RFA baseline population projections indicate that the general fund will maintain a positive balance throughout the study period. Additional revenue generated by recovering the unused mills is projected to substantially bolster this positive balance.

Subtracting 5 percent from the RFA baseline projections reduces demands placed on the school district

due to slower assumed population growth. Despite slower growth in revenue sources tied to population and property values under this scenario, net general fund revenues are projected to remain positive.

The higher population growth scenario, which adds 5 percent to the RFA projections, results in greater demands on the school district due to a faster-growing population. This is projected to result in general fund deficits between 2016 through 2028 without the recovered mills. However, again, incorporating the recovered mills is projected to generate a surplus in each year within the study period.

Appendix Tables 2 through 7 present projected BCSD revenues and expenditures in both real and current dollars, assuming a two percent annual rate of inflation.

IV. School Construction and Debt Schedule

A. Model Inputs

Using RFA population data, we estimated the pupil population for elementary, middle and high schools. Based on the historical ratio of enrollment to population within the school age cohort, we assume that 86 percent of school age students in the county attend public schools while the remainder attend private schools, schools outside the county, or are home schooled.

We used growth in the school aged population cohorts to project the population-related increase in enrollment in the district's elementary, middle, and high schools. BCSD can expand existing school facilities, construct new facilities, or allow overcrowding as enrollment grows.

B. Findings

BCSD can expect a steady increase in student growth over the next 20 years. This growth will not be uniform but will fluctuate as each age cohort progresses through the school system. For example, from 2016 to 2023 the growth in elementary school pupils is relatively low and will remain low as this group moves from elementary to middle school to high school.

Under the RFA low-high population growth scenarios, BCSD is expected to see future demand for additional school facilities occurring between 2023 and 2034 (Table A, below). The low population forecast indicates that the district will need four new elementary schools, two new middle schools, and one new high school through 2035. Using the high population forecast, the district will need four elementary schools, three new middle schools, and one high school. Table A does not include any of BCSD's new facilities added between 2015 and 2018, although the capacities of those schools were considered in this analysis.

Table A. Estimated New BCSD School Facilities

Year	Population Minus 5 Percent			Population Plus 5 Percent		
	Elem	Middle	High	Elem	Middle	High
2016						
2022			None			None
2023			1			1
2024						
2025	1					1
2026						
2027						
2028					1	
2029	1					
2030				1		1
2031		1			1	
2032	1					
2033					1	
2034	1					1
2035						
Total	4	2	1	4	3	1

Current BCSD school construction costs were used to estimate the future cost of new facilities between 2016 and 2035. The 2015 cost for an elementary school is \$24.6 million, a middle school is \$30.7 million, and a high school is \$82.0 million. Figure 4 shows the projected school construction costs under both scenarios. School enrollment projections and construction costs per year are show in Appendix Tables 8 and 9. We assume an annual inflation rate of two percent over the entire period.

Bond issues associated with the projected school construction schedule were calculated assuming a 20 year term and a five percent coupon rate. “Issuance cost” consists of the portion non financeable. These

projections may be found in Figure 5 and in Appendix Tables 10 and 11.

Part 2: Estimates Incorporating Volvo Location

V. Fiscal Impact Analysis

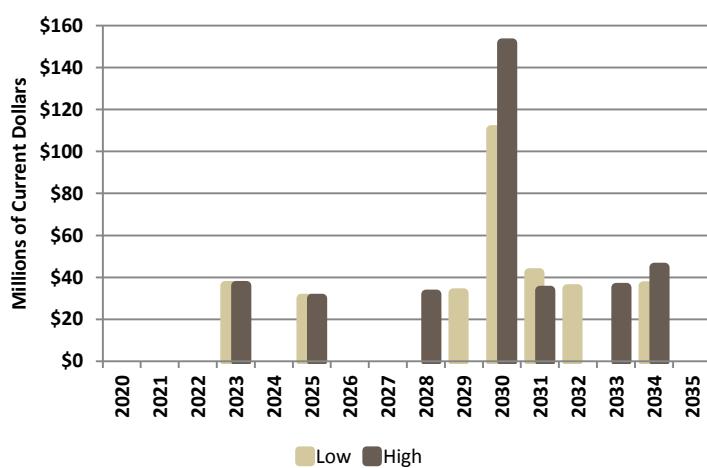

A. Model Inputs

This model takes into account the effects of construction and operation of the Volvo plant that is planned to be constructed in Berkeley County beginning in fall 2015. This plant was not accounted for in the RFA baseline projections because work on this project started prior to the Volvo announcement. In addition, because the details of the negotiations between the county and Volvo regarding any future fee in lieu of tax (FILOT) revenue that may be received by BCSD are not yet public, our model can only estimate the fiscal impact of the new plant on BCSD revenues based upon historical trends in the responsiveness of revenue from property taxes and fees in lieu of taxes to the value of capital stock.

Based on available information regarding the planned facility, our model spreads the announced \$500 million investment proportionally over the second half of 2015 and the years 2016 to 2017. Production is planned to begin in 2018, initially employing 2,000 workers at the plant. Employment at the plant is planned to increase to 4,000 workers after five years (beginning in 2023). The REMI model estimates that this investment and increase in direct employment will increase total employment in Berkeley County by more than 4,000 workers by 2019 and by over 8,000 workers by 2023.

Due to the increase in economic opportunity, wage rates, and overall income, the population in Berkeley County is projected by 2035 to swell by approximately 61,000 over RFA projections for that year. Given this substantial projected growth in population, the additional demands placed on the school district can be expected to be quite significant.

**Fig.4. Projected School Construction Costs
(RFA Projection)**

**Fig.5. Projected Annual Debt Service Cost
(RFA Projection)**

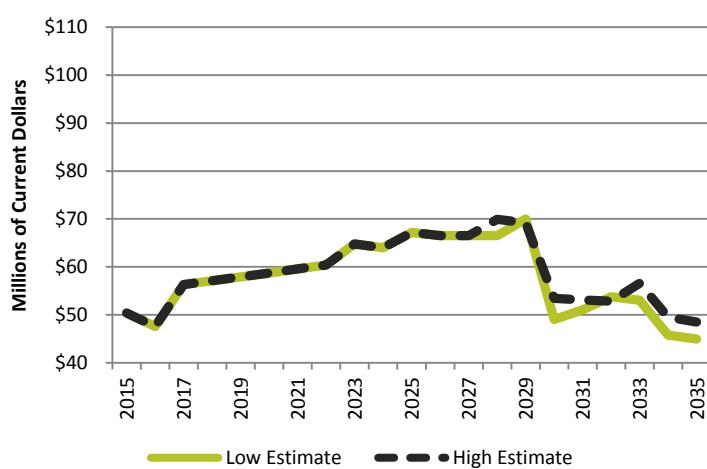

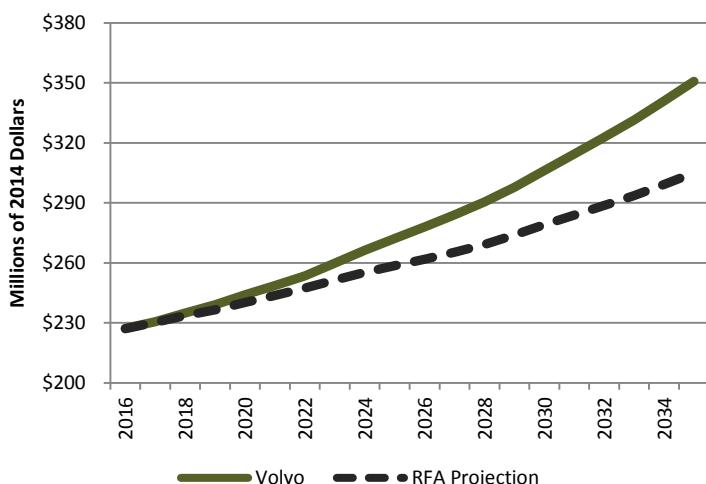

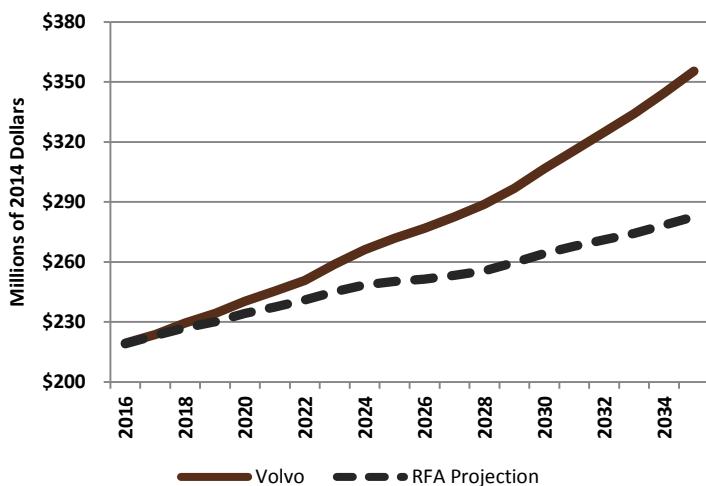

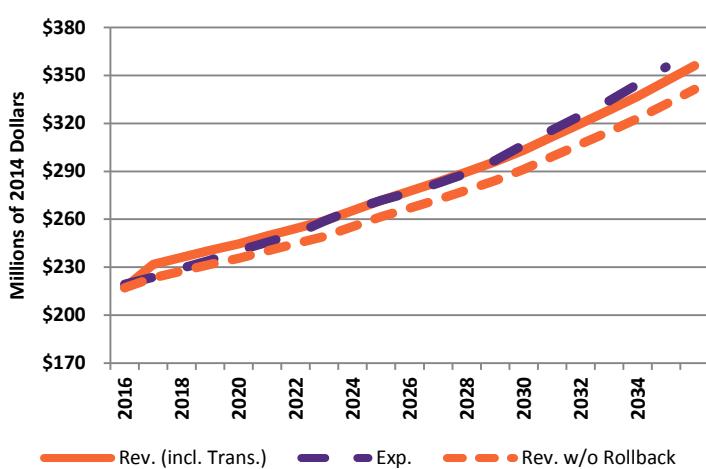

Fig.6. Projected General Fund Revenue**Fig.7. Projected General Fund Expenditures****Fig.8. Projected General Fund Rev. vs. Exp.
(Volvo Projection)**

Because this fiscal impact analysis portion of the model was based upon the economic impacts of the Volvo plant and not strictly on population projections, any sensitivity analysis (adding or subtracting 5 percent from the population projections) on the fiscal analysis would necessarily involve a different methodology than in the RFA models. Therefore, in order to avoid confusion in comparing the models with and without Volvo, no such sensitivity analysis was carried out on this portion of the study.

B. Findings

Results from this model are presented in Figures 6, 7 and 8, and in Appendix Tables 12 and 13. Our findings project that, without recovery of unused mills in 2015, the BCSD district general fund will be in a net deficit beginning in 2020 and in every year following through 2035. This is due to the large projected increase in population from economic migration associated with the Volvo plant and its indirect and induced effects on the county's economy. However, including the recovered mills allows the projected growth in property values (as measured by capital stock) in the county to generate sufficient revenue to create a net surplus in the general fund in each year through 2035. This surplus is declining over the study period, however, as demands on the district increase relative to revenue sources; therefore it appears likely that the general fund will move into a deficit at some point soon after 2035.

VI. School Construction and Debt Schedule

A. Model Inputs

The same methodology as in the RFA model was applied to modeling the need for school construction given the impacts from the Volvo plant. Because the school construction model is based upon population projections (albeit projections originating from the economic impact model in the previous section), the same methodology of applying a sensitivity analysis as before could be carried out. As such, the school construction schedule presented in the following is based upon

a “high” (population projections plus 5 percent) and a “low” (population projections minus 5 percent) estimate.

B. Findings

Based upon the adjusted state population forecast, BCSD will experience a steady increase in student growth over the next 20 years. The growth is not uniform but moves as each age cohort moves from one cohort to the next. Thus, from 2019 to 2023 the growth in elementary school pupils is relatively slow and as this age cohort moves from elementary to middle school to high school this slower pupil growth pattern prevails.

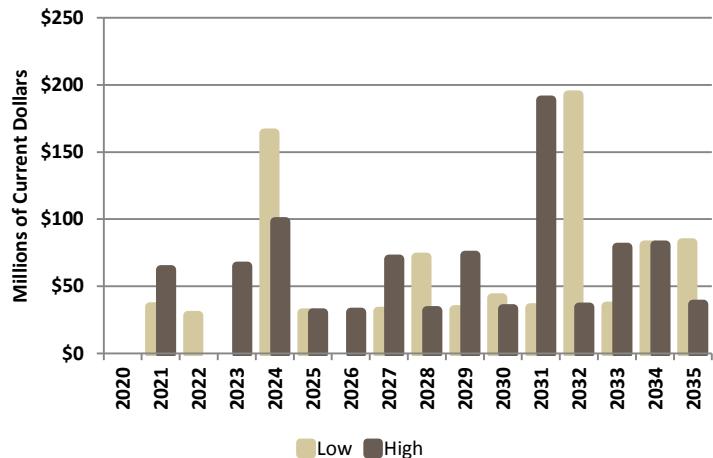

To meet the anticipated growth in pupils BCSD can expand existing school facilities, construct new facilities, or allow overcrowding.

Using the 2010 average school size for each type of facility, we projected two growth scenarios for BCSD. Scenario One is a 5 percent lower pupil forecast and suggests that the district will need 11 new elementary schools, seven new middle schools, and two new high schools over the next 20 years.

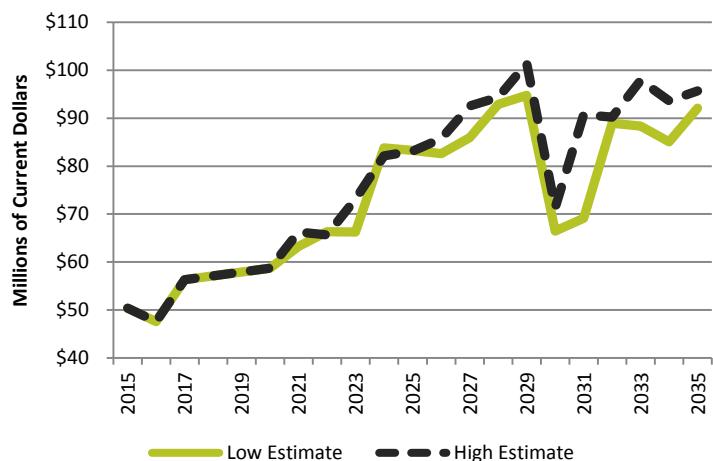

Scenario Two, based upon a 5 percent higher pupil growth rate, denotes a similar pattern in anticipated demand for additional or expanded facilities. In this scenario, BCSD will need 13 additional elementary schools, seven middle schools, and two high schools. Figure 9 presents projected school construction costs by year. Appendix Tables 14, 15 and 16 show projected pupil growth and construction costs by year.

BCSD’s 2015 construction cost for an elementary school is \$24.6 million, a middle school is \$30.7 million, and a high school is \$82.0 million. The 20 year timeframe we are working with covers from 2016 to 2035. We are using an annual inflation rate of 2 percent as a constant over the 20 year period (Although for the 12 months ending March 2015 the rate was -0.1 percent).

**Fig.9. Projected School Construction Costs
(Volvo Projection)**

**Fig.10. Projected Annual Debt Service Cost
(Volvo Projection)**

A schedule of bond issues and the associated debt service for these models is presented in Figure 10 and Appendix Tables 17 and 18.

Part 3: Conclusions

VII. Act 388

Act 388 of 2006 exempted owner-occupied residential property from school operating taxes beginning in tax year 2007. At the same time, the state retail sales tax was increased from 5 percent to 6 percent. Revenue from this tax increase was dedicated to compensating school districts for lost property tax revenue resulting from Act 388. School districts re-

ceived state funds to replace expected property tax funds beginning in fiscal year 2007-08. After the first year, districts received annual increases in state revenue for Act 388 homeowner tax relief by formula: inflation plus state population growth.

The Act 388 funding formula has disadvantaged many school districts, including BCSD, which previously relied on strong growth in the value of owner-occupied residential property to keep tax increases small despite the increasing cost of providing a quality public education. For example, the assessed value of the entire Berkeley County tax base grew at an average annual rate of 4.1 percent per year between tax years 2007 and 2012. The value of owner occupied residential property grew at 7.3 percent per year on average; however, the value of the property tax base with homeowner property excluded grew much more slowly at 2.6 percent per year. State homeowner tax relief from Act 388 grew at an intermediate pace of 5.3 percent a year between fiscal years 2007-08 and 2012-13.

BCSD has estimated that Act 388's school finance shift from local property taxes to formula-funded state revenue reduced the district's revenue by \$4.5 million in fiscal year 2014-15.

VIII. Conclusion

Our models first projected the growth in general funds and expenditures for the Berkeley County School District through the fiscal year ending 2035. These projects are based upon population estimates provided by the South Carolina Revenue and Fiscal Affairs Office. This population projection was used as a baseline for population growth in all four fiscal impact model runs. Each run estimated revenue and expenditures for a different population growth scenario. The first three model runs used the RFA baseline and the baseline plus and minus five percent. The final model used the RFA as a baseline to which the REMI PI⁺ model added economic migration associated with the announced location of the Volvo automotive plant in the county.

In all four models, BCSD's fiscal position appears sound, although the recovery of unused mills from

the three years preceding 2015 was key to preventing the district's general fund from going into deficit in the model incorporating population impacts from the Volvo plant.

Secondly, our models projected the need for new school construction based upon both the RFA projections and the population projections generated by the REMI model incorporating the Volvo plant. Both of these growth scenarios modeled population growth plus and minus 5 percent of the projected levels. From these construction needs estimates, annual debt service costs were projected. Unsurprisingly, debt service costs associated with the models for higher population growth were greater than those with low population growth. This was especially true for the models incorporating the Volvo plant, as economic migration associated with the plant is expected to generate a substantial demand for new school facilities over the next twenty years.

Table 1. Methodology for Fiscal Projections

Revenues	
Revenues from Local Sources	
Ad Valorem Taxes	Indexed to growth in residential & non-residential capital stock
Revenue in Lieu of Taxes	Indexed to growth in non-residential capital stock
<i>Property Tax Recovery (FY2016)</i>	BCSD projection for 2016, then indexed to growth in residential & non-residential capital stock
All other revenue from local sources	Historical average value (fixed, grows at rate of inflation)
Restricted State Funding	
Bus Driver Salary	Fixed at 2014 value
Employee Fringes (employer paid)	Indexed to student-age population growth
Other	Excluded from projections
Education Finance Act (EFA)	Indexed to student-age population growth
State Revenue in Lieu of Taxes:	
Tier I	Fixed (constant-dollar value declines at assumed rate of inflation)
Tier II	Fixed (constant-dollar value declines at assumed rate of inflation)
Tier III	2014 value, then indexed to state population growth
Other	Historical average value (fixed, grows at rate of inflation)
Expenditures	
Instruction	
General Instruction:	
Kindergarten	Indexed to 5 year-old population growth
Primary	Indexed to 5-9 year-old population growth
Elementary (Middle)	Indexed to 10-14 year-old population growth
High School	Indexed to 15-17 year-old population growth
Other Programs	Indexed to total student population growth
Support Services	
Interfund Transfers	
Transfer to Debt Service Fund (<i>expires after 2016</i>)	Actual value, expires in 2016
Transfer from EIA (Teacher Salary Supplement)	Fixed at 2016 value (grows at rate of inflation)
