<b>Intended User</b>	<p>1. APME member companies</p> <p>2. L</p>
<b>General Purpose</b>	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.
<b>Detailed Purpose</b>	<p>1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes,</p> <p>2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p>
<b>Commissioner</b>	- APME, Association of Plastics Manufacturers in Europe Avenue E. van Nieuwenhuysse 4 Box 3 B-1160 Brussels .
<b>Practitioner</b>	Boustead, Ian - .
<b>Reviewer</b>	
<b>Applicability</b>	The data are calculated on a cradle to gate basis, therefore, no supplier activities should be connected to, e.g., nuclear power, coal and limestone.
<b>About Data</b>	<p>European average data for polycarbonate production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. Data on the polycarbonate production processes have been supplied by the 3 producers in Europe and some suppliers of major raw materials. These companies were requested to supply data for a 12 month period during 1992-94. Data should be fairly representative for production of polycarbonate in Europe. However, the data quality is dependent on the quality of the records maintained by the individual companies.</p> <p>Site-specific data for raw materials and fuels have been used when available. Data from other manufacturers have been used in other cases.</p> <p>The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency. No other process data have been derived from the literature.</p> <p>For fuels and energy, the following gross calorific values (energy content) have been used in the calculations: 45,0 MJ/kg for oil, 38,8 MJ/m<sup>3</sup> (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal, 15,0 MJ/kg for lignite, 9,3 MJ/kg for sulphur.</p>

## SPINE LCI dataset: Extraction to polyethylene all grades APME

Administrative	
<b>Finished</b>	Y

<b>Date Completed</b>	1993
<b>Copyright</b>	APME
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Extraction to polyethylene all grades APME
<b>Functional Unit</b>	1 kg of polyethylene all grades
<b>Functional Unit Explanation</b>	<p>Low density polyethylene (LDPE), high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) granules. Data were obtained from a total of 36 European ethylene polymerisation plants producing 4,5E6 tonnes of polyethylene of all grades: 10 plants produced 1,3E6 tonnes of HDPE, 22 plants produced 2,8E6 tonnes of LDPE, and 4 plants produced 0,36E6 tonnes of LLDPE.</p> <p>Although conversion of resin to granules has been included for the granulated products, the data are based on production of all saleable products, including any sub-standard resin that is sold for other uses.</p>
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average values, Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average values, Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>The following major processes are included: North Sea gas extraction and delivery; North Sea crude oil extraction and delivery; crude oil extraction from other sources + average tanker transport of crude oil to Europe; oil refining for naphtha; cracking of naphtha to ethene, propene etc; polymerisation of ethylene to low density polyethylene (LDPE), high density polyethylene (HDPE) or linear low density polyethylene (LLDPE); conversion of resins to granules. Also electricity production, steam production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from a large number of plants in different European countries, the operating conditions differ a lot. Some general information about the chemical processes are found in the "Eco-profiles..." reports. The polymerisation process, for instance, are described at p 1 in Report 3.</p> <p>If it was not known whether a plant specifically used North Sea gas or oil, or non-North Sea oil, as the primary feedstock, it was assumed that the mix of North Sea crude oil and non-North Sea crude oil into the refineries was the same as for all EC countries (around 1990), i.e. 15% derived from North Sea oil and 85% from non-North Sea sources. Only data from two oil wells outside the North Sea area were available. When the ethylene sources for a polymerisation plant were known, site-specific data were used, otherwise average values. Most refineries and many polymerisation plants generate steam on-site and, in many instances, electricity is co-generated. Where plant details were not available, average values were used. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p>

System Boundaries	
<b>Nature Boundary</b>	As the level of detail in data supplied by the producers varied significantly from one producer to another, the level of detail in the final result is governed, to a great extent, by the returned data with the lowest level of detail. For instance, hydrocarbon emissions are presented as Hydrocarbons, although some producers provided data for individual hydrocarbons.
<b>Time Boundary</b>	Data were collected around 1990. The exact year is not stated. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older. For ethylene production, it is thought that the data is "a good representation of typical average European practice during the period 1989-90".
<b>Geographical Boundary</b>	European average. No specific sites are mentioned. Data were obtained from a total of 36 European ethylene polymerisation plants producing 4,5E6 tonnes of polyethylene of all grades: 10 plants produced 1,3E6 tonnes of HDPE, 22 plants produced 2,8E6 tonnes of LDPE, and 4 plants produced 0,36E6 tonnes of LLDPE. For production of major raw materials, data were obtained from 19 crackers, 4 refineries, 3 North Sea oil rig operators, 2 non-North Sea oil wells.
<b>Other Boundaries</b>	<p>Subsystems excluded:</p> <ul style="list-style-type: none"> <li>- Production of additives such as antioxidants, dyes and fillers.</li> <li>- Outer packaging materials for the final products.</li> <li>- Metallic catalysts used in polymerisation.</li> </ul> <p>The system boundaries for extraction of crude oil and gas, oil refining and cracking are not stated in detail, while the system boundaries for electricity production are not stated at all. Hence, it is not known what subsystems have been excluded.</p>

	Hydrocarbon co-monomers added to the polymerisation process have all been treated as hexane.
	No cut-off criteria for exclusion of minor inputs and outputs are stated.
<b>Allocations</b>	Inputs and outputs to/from the North Sea oil rigs have been partitioned between the different products on the basis of the calorific values of the products.  Inputs and outputs to/from the refineries have been partitioned across all usable or saleable refinery products on the basis of mass. This also applies to the products from the crackers.
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1990
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	European average data. Data from 36 ethylene polymerisation plants were averaged over all plants and weighted by the production (mass) from each plant [2]. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers, otherwise horizontal averaging has been applied. In vertical averaging, each production line (i.e. each polymerisation plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production lines weighted by the output from each production line (polymerisation plant) [3]. For some sub-processes, plant specific data were not available, and average data for that sub-process were used instead (i.e. horizontal averaging). In the present data set, the proportions of oil and gas, respectively, used as fuel and feedstock, have been corrected according to instructions in ref. [3]. The reason for the correction is that a proportion of the feedstock (gas and oil) inputs to the processes invariably ends up as waste, and that these residues are generally used as fuels within the plants. As a consequence, the amount of CO <sub>2</sub> emission to air has also been corrected, since CO <sub>2</sub> , unlike other emissions, is not measured but calculated from the amounts of combusted fuels. For fuels and energy, the following gross calorific values (energy content) have been used in the calculations: 45,0 MJ/kg for oil, 38,8 MJ/m <sup>3</sup> (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal. The following assumed contents of carbon in the fuels have been used in the calculations: 80% in coal, 85,71% in oil, 75,0% in gas. 1 kg carbon in a fuel gives rise to 3,67 kg of CO <sub>2</sub> .
<b>Literature Reference</b>	"Eco-profiles of the European plastics industry" [1] Report 2: Olefin feedstock sources, I. Boustead, APME/PWMI, 1993. [2] Report 3: Polyethylene and polypropylene, I. <b>Practitioner</b>	Boustead, Ian - .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The present data for polyethylene all grades could be used whenever the exact type of PE is not known. For LDPE, HDPE and LLDPE, there are specific data from APME in separate data sets.</p> <p>The data are calculated on a cradle to gate basis, therefore, no supplier activities should be connected to, e g, nuclear power, coal and limestone.</p>
<b>About Data</b>	<p>European average data for polyethylene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with four independent experts on LCA (eco-balance analysis). The independent panel of experts supervised the study and developed the methodology for collecting, analysing and presenting the inventory data.</p> <p>The initial set of data was collected by sending out a standard questionnaire to the producers. Data on the polyethylene production processes have been supplied by the 36 producers in Europe. Data are average values weighted by the mass of polyethylene produced by each of the polymerisation plants. As a large number of producers have participated in the study, the data should be fairly representative for production of polyethylene in Europe.</p> <p>Site-specific data for raw materials and fuels have been used when available. Average values have been used in other cases. However, it should be borne in mind that data for some supplying processes are based on only a few plants. For instance, only data from two non-North Sea oil wells were available.</p> <p>The source and quality of data for public electricity production are not stated.</p> <p>The range of total gross energy (fuels + feedstock) consumed was 69-107 MJ/kg with a weighted average of 85,83 MJ. The range is not a statistical variation, but reflects different technologies, feedstocks, transports and operating conditions in different countries and plants. For fuels and energy, the following gross calorific values (energy content) have been used in the calculations: 45,0 MJ/kg for oil, 38,8 MJ/m<sup>3</sup> (54,1 MJ/kg) for natural gas, 28,0 MJ/kg for coal.</p> <p>The accuracy of the data for air and water emissions varies for the different emissions. In general, more accurate information are available on those emissions statutorily regarded as having a more severe effect on the environment. This is because they are more closely measured in order to satisfy the local pollution regulations. Conversely, many of the non-regulated emissions are usually estimates. A large number of emissions have been aggregated into general groups, e g Metals, Hydrocarbons, Dissolved organics.</p> <p>The CO<sub>2</sub> emissions to air have been calculated from the consumption of fossil fuels in the different processes. Since feedstock waste materials arising during production are used as fuels in the processes, the amounts of supplied feedstock inputs (oil and gas) should be adjusted for these residues. In the present data set, the feedstock inputs have indeed been reduced, and the fuel inputs and CO<sub>2</sub> emissions have been increased correspondingly, in order to account for the amounts of feedstock estimated to be used as fuel.</p>

## SPINE LCI dataset: Extraction to polyethylene HD APME

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	1999
<b>Copyright</b>	APME
<b>Availability</b>	Public
<b>Technical System</b>	
<b>Name</b>	Extraction to polyethylene HD APME
<b>Functional Unit</b>	1 kg of high density polyethylene (HDPE)

<b>Functional Unit Explanation</b>	HDPE resin, which is, for example, used in the production of HDPE food containers, automobile fuel tanks, bottles, pipes and film. It is not explained in the Eco-profiles report what is meant by "resin", but a fair guess is that the physical form of the polymer product is granules, as this is the most important product delivered by the polymerisation plants to their customers.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>Production of high density polyethylene (HDPE) including all major operations from extraction of crude oil and gas to polymerisation.</p> <p>HDPE is produced in a low pressure process and contains fewer side branches than low density polyethylene, which accounts for a more regular structure and a higher density. Polyethylene is usually polymerised by a free radical mechanism in which an initiator opens the double bond of the ethene (<math>\text{CH}_2=\text{CH}_2</math>) molecule and attaches itself, leaving the other "open" bond, or radical, free to attack a further ethene molecule. The process repeats itself until all of the monomer is used up or, more commonly, the reactive end is itself terminated by specifically added reactants.</p> <p>Cracking of naphtha to ethene, propene etc: The output fractions from an oil refinery are complex mixtures of mostly unreactive saturated hydrocarbons. Cracking is performed to 1) reduce the variety and size of the hydrocarbons, 2) introduce unsaturation into the hydrocarbons.</p> <p>In addition to the mentioned processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 10 plants in 7 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for high density polyethylene (LDPE), ethylene and naphtha, and in the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	<p>"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.</p> <p>The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.</p> <p>Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.</p> <p>Emissions &lt;0.5 mg were presented as &lt;1 mg in the Eco-profiles result tables. In this activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.</p> <p>The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.</p>
<b>Time Boundary</b>	Data refer to the years 1992-93. Data for upstream production of crude oil, naphtha and ethylene are from 1990-96; data for production of other fuels and raw materials are probably from the same time, or somewhat older.

<b>Geographical Boundary</b>	<p>European average data. Results are based on data for 10 polyethylene HD production plants that produced 1.32 million tonnes (32% of the total European production in 1997). Data were supplied by 10 plants in 7 countries: Austria, Belgium, France, Netherlands, Portugal, Sweden, UK.</p> <p>For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates. For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.</p> <p>The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.</p>
<b>Other Boundaries</b>	<p>The following excluded subsystems are explicitly mentioned in the Methodology report:</p> <ul style="list-style-type: none"> <li>- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)</li> <li>- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.</li> <li>- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute &lt;0.01% to the totals.</li> </ul> <p>No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.</p>
<b>Allocations</b>	<p>In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:</p> <ul style="list-style-type: none"> <li>- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.</li> <li>- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.</li> <li>- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.</li> <li>- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.</li> <li>- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.</li> <li>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl.</li> <li>- On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.</li> </ul>
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1992 to 1993
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	European average data. Results are based on data supplied by 10 production plants in 7 countries: Austria, Belgium, France, Netherlands, Portugal, Sweden, UK. Their total production was 1.32 million tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.

	<p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources &lt;0.5 mg have been assumed by Gunnar Mattson, ABB Corporate Research (GM) to be 0.25 mg, i.e. half the "&lt;" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.15 MJ) and Sulphur (&lt;0.01 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-05-30 SECRC/GM</p>

## About Inventory

### Publication

"Eco-profiles of the European plastics industry", reports for high density polyethylene (HDPE), ethylene and naphtha.  
 "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999.  
 Reports are available at APME's web site <http://lca.apme.org>.

(APME = Association of Plastics Manufacturers in Europe)

The APME project co-ordinator: Vince Matthews.  
 The members of the original independent expert panel: Ian Boustead, Paul Fink, Horst Langowski, Gustav Sundstrom.

Editor: Data were entered into the SPINE format by Gunnar Mattsson, ABB Corporate Research, 2001-05-30.

Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology

Published in SPINE@CPM: 29 October 2001

### Intended User

1. APME member companies
2. L

### General Purpose

The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.

### Detailed Purpose

Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.

- 1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes,
- 2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of

	<p>individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>
<b>Commissioner</b>	- APME, Association of Plastics Manufacturers in Europe Avenue E. van Nieuwenhuyse 4 Box 3 B-1160 Brussels .
<b>Practitioner</b>	Boustead, Ian - .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.</p> <p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for high density polyethylene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the HDPE production processes have been supplied by 10 plants in 7 European countries. Data are probably fairly representative for production of HDPE in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p> <p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e. each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x {mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts of Mn, P and Ti resources.</li> </ul>

	<ul style="list-style-type: none"> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>
<b>Notes</b>	

## SPINE LCI dataset: Extraction to polyethylene LD APME

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	1999
<b>Copyright</b>	APME
<b>Availability</b>	Public

<b>Technical System</b>	
<b>Name</b>	Extraction to polyethylene LD APME
<b>Functional Unit</b>	1 kg of low density polyethylene (LDPE)
<b>Functional Unit Explanation</b>	LDPE resin, which is typically used in the production of LDPE film and containers. It is not explained in the Eco-profiles report what is meant by "resin", but a fair guess is that the physical form of the polymer product is granules, as this is the most important product delivered by the polymerisation plants to their customers.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>Production of low density polyethylene (LDPE) including all major operations from extraction of crude oil and gas to polymerisation.</p> <p>LDPE is produced in a high pressure process and contains a high level of side branching with relatively long side chains, which accounts for LDPE's relatively low density. Polyethylene is usually polymerised by a free radical mechanism in which an initiator opens the double bond of the ethene (CH<sub>2</sub>=CH<sub>2</sub>) molecule and attaches itself, leaving the other "open" bond, or radical, free to attack a further ethene molecule. The process repeats itself until all of the monomer is used up or, more commonly, the reactive end is itself terminated by specifically added reactants.</p> <p>Cracking of naphtha to ethene, propene etc: The output fractions from an oil refinery are complex mixtures of mostly unreactive saturated hydrocarbons. Cracking is performed to 1) reduce the variety and size of the hydrocarbons, 2) introduce unsaturation into the hydrocarbons.</p> <p>In addition to the mentioned processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 15 plants in 7 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for low density polyethylene (LDPE), ethylene and naphtha, and in the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

## System Boundaries

<b>Nature Boundary</b>	<p>"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.</p> <p>The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.</p> <p>Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.</p> <p>Emissions &lt;0.5 mg were presented as &lt;1 mg in the Eco-profiles result tables. In this activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.</p> <p>The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.</p>
<b>Time Boundary</b>	Data refer to the years 1989-92. Data for upstream production of crude oil, naphtha and ethylene are from 1990-96; data for production of other fuels and raw materials are probably from the same time, or somewhat older.
<b>Geographical Boundary</b>	<p>European average data. Results are based on data for 15 polyethylene LD production plants that produced 2.3 million tonnes (47% of the total European production in 1997). Data were supplied by 15 plants in 7 countries: Austria, Belgium, Finland, Netherlands, Portugal, Sweden, UK.</p> <p>For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates. For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.</p> <p>The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.</p>
<b>Other Boundaries</b>	<p>The following excluded subsystems are explicitly mentioned in the Methodology report:</p> <ul style="list-style-type: none"> <li>- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)</li> <li>- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.</li> <li>- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute &lt;0.01% to the totals.</li> </ul> <p>No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.</p>
<b>Allocations</b>	<p>In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:</p> <ul style="list-style-type: none"> <li>- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.</li> <li>- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.</li> <li>- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.</li> <li>- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.</li> <li>- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.</li> <li>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or</li> </ul>

	chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl. - On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1989 to 1992
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	European average data. Results are based on data supplied by 15 production plants in 7 countries: Austria, Belgium, Finland, Netherlands, Portugal, Sweden, UK. Their total production was 2.3 million tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO <sub>2</sub> emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m <sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources <0.5 mg have been assumed by Gunnar Mattson, ABB Corporate Research (GM) to be 0.25 mg, i.e. half the "<" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.11 MJ) and Sulphur (<0.01 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-05-29 SECRC/GM
<b>Literature Reference</b>	"Eco-profiles of the European plastics industry", reports for low density polyethylene (LDPE), ethylene and naphtha. "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a> . (APME = Association of Plastics Manufacturers in Europe)
<b>Notes</b>	In the result tables in the "Eco-profiles..." report, not only total fuels and feedstocks, emissions to air and water, and solid waste are presented, but also the amounts caused by fuel production, fuel use, transport, feedstock (only for fuels and feedstocks) and processes. As the APME substance nomenclature and the ABB database nomenclature sometimes differ, the original APME substance name is given within "" in the flow metadata Notes field. Please note: Some other interpretations/changes have been made from the original report by Gunnar Mattson, ABB Corporate Research. See Method and AboutData for details.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
Notes: "air", compressed air	Input	Natural resource	Air	100			g	Ground

## About Inventory

### Publication

"Eco-profiles of the European plastics industry", reports for low density polyethylene (LDPE), ethylene and naphtha.  
"Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999.  
Reports are available at APME's web site <http://lca.apme.org>.

	<p>(APME = Association of Plastics Manufacturers in Europe)</p> <p>The APME project co-ordinator: Vince Matthews. The members of the original independent expert panel: Ian Boustead, Paul Fink, Horst Langowski, Gustav Sundstrom.</p> <p>-----</p> <p>Editor: Data were entered into the SPINE format by Gunnar Mattsson, ABB Corporate Research, 2001-05-29.</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>Published in SPINE@CPM: 29 October 2001</p> <p>-----</p>
<b>Intended User</b>	<p>1. APME member companies</p> <p>2. L</p>
<b>General Purpose</b>	<p>The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.</p>
<b>Detailed Purpose</b>	<p>Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.</p> <p>1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>
<b>Commissioner</b>	<p>- APME, Association of Plastics Manufacturers in Europe Avenue E. van Nieuwenhuysse 4 Box 3 B-1160 Brussels .</p>
<b>Practitioner</b>	<p>Boustead, Ian - .</p>
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.</p> <p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for low density polyethylene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the LDPE production processes have been supplied by 15 plants in 7 European countries. Data are probably fairly representative for production of LDPE in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p>

	<p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e. each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x {mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes from the original report have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts of Mn, P and Ti resources.</li> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>

## SPINE LCI dataset: Extraction to polyethylene linear LD APME

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	1999
<b>Copyright</b>	APME
<b>Availability</b>	Public

<b>Technical System</b>	
<b>Name</b>	Extraction to polyethylene linear LD APME
<b>Functional Unit</b>	1 kg of linear low density polyethylene (LLDPE)
<b>Functional Unit Explanation</b>	LLDPE resin. It is not explained in the Eco-profiles report what is meant by "resin", but a fair guess is that the physical form of the polymer product is granules, as this is the most important product delivered by the polymerisation plants to their customers.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>Production of linear low density polyethylene (LLDPE) including all major operations from extraction of crude oil and gas to polymerisation.</p> <p>LLDPE contains a large number of side branches but they are very short so that the polymer is able to pack well in the solid state. Polyethylene is usually polymerised by a free radical mechanism in which an initiator opens the double bond of the ethene (CH<sub>2</sub>=CH<sub>2</sub>) molecule and attaches itself, leaving the other "open" bond, or radical, free to attack a further ethene molecule. The process repeats itself until all of the monomer is used up or, more commonly,</p>

	<p>the reactive end is itself terminated by specifically added reactants.</p> <p>Cracking of naphtha to ethene, propene etc: The output fractions from an oil refinery are complex mixtures of mostly unreactive saturated hydrocarbons. Cracking is performed to 1) reduce the variety and size of the hydrocarbons, 2) introduce unsaturation into the hydrocarbons.</p> <p>In addition to the mentioned processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 3 plants in 2 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for linear low density polyethylene (LLDPE), ethylene and naphtha, and in the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

## System Boundaries

### ***Nature Boundary***

"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.

The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.

Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.

Emissions <0.5 mg were presented as <1 mg in the Eco-profiles result tables. In this activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.

The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.

### ***Time Boundary***

Data refer to the years 1990-92. Data for upstream production of crude oil, naphtha and ethylene are from 1990-96; data for production of other fuels and raw materials are probably from the same time, or somewhat older.

### ***Geographical Boundary***

European average data. Results are based on data for 3 polyethylene linear LD production plants that produced 341000 tonnes (21% of the total European production in 1997). Data were supplied by 3 plants in 2 countries: France, Netherlands.

For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates. For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.

The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.

### ***Other Boundaries***

The following excluded subsystems are explicitly mentioned in the Methodology report:

- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)
- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.
- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0.01% to the totals.

No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate

	that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.
<b>Allocations</b>	<p>In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:</p> <ul style="list-style-type: none"> <li>- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.</li> <li>- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.</li> <li>- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.</li> <li>- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.</li> <li>- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.</li> <li>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl.</li> <li>- On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.</li> </ul>
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1990 to 1992
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	<p>European average data. Results are based on data supplied by 3 production plants in 2 countries: France, Netherlands. Their total production was 341000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources &lt;0.5 mg have been assumed by GM to be 0.25 mg, i.e. half the "&lt;" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.02 MJ) and Sulphur (&lt;0.01 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-05-30 SECRC/GM</p>

"Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a> . (APME = Association of Plastics Manufacturers in Europe)
<b>Notes</b>	<p>In the result tables in the "Eco-profiles..." report, not only total fuels and feedstocks, emissions to air and water, and solid waste are presented, but also the amounts caused by fuel production, fuel use, transport, feedstock (only for fuels and feedstocks) and processes. As the APME substance nomenclature and the ABB database nomenclature sometimes differ, the original APME substance name is given within "" in the flow metadata Notes field. Please note: Some other interpretations/changes have been made from the original report by Gunnar Mattson, ABB Corporate Research. See Method and AboutData for details.</p>

About Inventory	
<b>Publication</b>	<p>"Eco-profiles of the European plastics industry", reports for linear low density polyethylene (LLDPE), ethylene and naphtha.  "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999.  Reports are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p> <p>(APME = Association of Plastics Manufacturers in Europe)</p> <p>The APME project co-ordinator: Vince Matthews.  The members of the original independent expert panel: Ian Boustead, Paul Fink, Horst Langowski, Gustav Sundstrom.</p> <p>-----</p> <p>Editor: Data were entered into the SPINE format by Gunnar Mattsson, ABB Corporate Research, 2001-05-30.</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>Published in SPINE@CPM: 29 October 2001</p> <p>-----</p>
<b>Intended User</b>	1. APME member companies 2. L
<b>General Purpose</b>	The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.
<b>Detailed Purpose</b>	<p>Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.</p> <p>1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes,  2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>
<b>Commissioner</b>	- APME, Association of Plastics Manufacturers in Europe Avenue E. van Nieuwenhuysse 4 Box 3 B-1160 Brussels .
<b>Practitioner</b>	Boustead, Ian - .
<b>Reviewer</b>	
<b>Applicability</b>	The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.

	<p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for linear low density polyethylene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the LLDPE production processes have been supplied by 3 plants in 2 European countries. It is not known how representative data are for production of LLDPE in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p> <p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e. each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x {mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes from the original report have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts of Mn, P and Ti resources.</li> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>

<b>Name</b>	Extraction to SAN APME
<b>Functional Unit</b>	1 kg of SAN (styrene-acrylonitrile copolymer)
<b>Functional Unit Explanation</b>	<p>SAN is a copolymer of styrene (<math>C_6H_5-CH=CH_2</math>) and acrylonitrile (<math>CH_2=CH-CN</math>).</p> <p>Typical uses of SAN: kitchen appliances, refrigerator inner parts, food containers, lighting and glazing parts, blend polymer with polybutadiene in ABS.</p>
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>Production of SAN (styrene-acrylonitrile copolymer) including all major operations from extraction of crude oil and gas to polymerisation. SAN is produced in the same production sequence as ABS (acrylonitrile-butadiene-styrene copolymer), which means that the technical system is similar.</p> <p>According to a schematic flow diagram in the "Eco-profiles..." report, the following sub-processes are included:</p> <ul style="list-style-type: none"> <li>- Cracking of naphtha and/or natural gas for ethylene, propylene and butenes.</li> <li>- Styrene production: Reforming of naphtha for benzene + production of benzene from cracking products ("pygas") in an aromatics plant, ethylene from cracker, ethylbenzene production, styrene production.</li> <li>- Acrylonitrile production: Propylene from cracker, production of ammonia from natural gas and air, production of acrylonitrile from ammonia and propylene.</li> <li>- SAN production from styrene and acrylonitrile.</li> </ul> <p>In addition to the mentioned sub-processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 3 plants in 2 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for SAN (styrene-acrylonitrile copolymer), naphtha and the other intermediates, and the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	<p>"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.</p> <p>The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.</p> <p>Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.</p> <p>Emissions &lt;0.5 mg were presented as &lt;1 mg in the Eco-profiles result tables. In this activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.</p> <p>The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy</p>

	equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.
<b>Time Boundary</b>	Data refer to the years 1994 to 1995. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
<b>Geographical Boundary</b>	<p>European average data. Results are based on data for 3 SAN production plants that produced 115 000 tonnes (unknown fraction of the total European production). Data were supplied by 3 plants in 2 countries: Germany and Netherlands.</p> <p>For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates. For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.</p> <p>The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.</p>
<b>Other Boundaries</b>	<p>The following excluded subsystems are explicitly mentioned in the Methodology report:</p> <ul style="list-style-type: none"> <li>- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)</li> <li>- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.</li> <li>- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute &lt;0.01% to the totals.</li> </ul> <p>No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.</p>
<b>Allocations</b>	<p>In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:</p> <ul style="list-style-type: none"> <li>- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.</li> <li>- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.</li> <li>- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.</li> <li>- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.</li> <li>- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.</li> <li>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl.</li> <li>- On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.</li> </ul>
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1994 to 1995
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	European average data. Results are based on data supplied by 3 production plants in 2 countries: Germany and Netherlands. Their total production was 115 000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each

	<p>plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources &lt;0.5 mg have been assumed by Gunnar Mattson, ABB Corporate research (GM) to be 0.25 mg, i.e. half the "&lt;" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.11 MJ) and Sulphur (0.02 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-06-18 SECRC/GM</p>
<b>Literature Reference</b>	<p>"Eco-profiles of the European plastics industry", report for SAN (styrene-acrylonitrile copolymer), naphtha and the other intermediates. "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. ### Intended User

1. APME member companies
2. L

### General Purpose

The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.

### Detailed Purpose

Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.

- 1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes,
- 2) Provide valuable inventory data for downstream users of plastics, such as packaging

	<p>manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>

<b>Reviewer</b>	
<b>Applicability</b>	<p>The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.</p> <p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for SAN production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the SAN production processes have been supplied by 3 plants in 2 European countries. Data are probably fairly representative for production of SAN in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p> <p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e. each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x {mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes from the original report have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts</li> </ul>

	<p>of Mn, P and Ti resources.</p> <ul style="list-style-type: none"> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>
<b>Notes</b>	<p>-----</p> <p>--- Changes made to the data set after publishing in SPINE@CPM---</p> <p>&gt;&gt;&gt; 29 October 2001 &lt;&lt;&lt;</p> <p>Changes made by Gunnar Mattson, ABB Corporate Research: The general documentation of the data have been supplemented to improve the transparency and the consistency with other published data sets from the APME reports.</p> <p>The earlier published edition of the data set were named "Production of SAN co-polymer granules", and were documented by Sofia Medin, Electrolux Research and Innovation AB.</p>

## SPINE LCI dataset: Extraction to toluene APME

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1999
<b>Copyright</b>	APME
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Extraction to toluene APME
<b>Functional Unit</b>	1 kg of toluene
<b>Functional Unit Explanation</b>	Toluene, C <sub>6</sub> H <sub>5</sub> CH <sub>3</sub> , is an organic compound, liquid at room temperature. It is used as a solvent, in benzene production, and in TDI production (TDI is an intermediate in polyurethane production).
<b>Process Type</b>	Cradle to gate
<b>Site</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Sector</b>	Materials and components
<b>Owner</b>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<b>Technical system description</b>	<p>Production of toluene including all major operations from extraction of crude oil and gas to catalytic reforming of naphtha, solvent extraction and fractional distillation.</p> <p>Most toluene is produced directly from naphtha by catalytic reforming, a process in which naphthenic compounds in naphtha are dehydrogenated. The basic feedstock is thus converted into a mixture of products, mainly benzene, toluene and xylene; hence, the process is often called the BTX process. Benzene and the other aromatics are isolated in the pure state from the output of the reformer by solvent extraction and fractional distillation. The output of toluene is maximised if the naphtha feed is rich in ring compounds containing 7 carbon atoms.</p> <p>In addition to the mentioned sub-processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 10 plants in 4 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for toluene and naphtha, and the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

## System Boundaries

### **Nature Boundary**

"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.

The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.

Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.

Emissions <0.5 mg were presented as <1 mg in the Eco-profiles result tables. In this activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.

The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.

### **Time Boundary**

Data refer to the years 1990-96. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.

### **Geographical Boundary**

European average data. Results are based on data for toluene production plants that produced 1,2 million tonnes. Data were supplied by 10 plants in 4 countries: Belgium, Germany, Italy and Netherlands.

For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.

The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.

### **Other Boundaries**

The following excluded subsystems are explicitly mentioned in the Methodology report:

- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)
- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.
- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute <0.01% to the totals.

No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.

### **Allocations**

In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:

- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.
- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.
- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.
- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.
- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.

	<p>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl.</p> <p>- On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.</p>
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1990 to 1996
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	As no data for extraction of dolomite in Norway was obtained, figures from Swedish extraction of dolomite has been used.
<b>Method</b>	European average data. Results are based on data supplied by 10 production plants in 4 countries: Belgium, Germany, Italy and Netherlands. Their total production was 1.2 million tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO <sub>2</sub> emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m <sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources <0.5 mg have been assumed by Gunnar Mattsson, ABB Corporate Research (GM) to be 0.25 mg, i.e. half the "<" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.07 MJ) and Sulphur (<0.01 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-01-19 SECRC/GM
<b>Literature Reference</b>	"Eco-profiles of the European plastics industry", reports for toluene and naphtha. "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a> . (APME = Association of Plastics Manufacturers in Europe)
<b>Notes</b>	In the result tables in the "Eco-profiles..." report, not only total fuels and feedstocks, emissions to air and water, and solid waste are presented, but also the amounts caused by fuel production, fuel use, transport, feedstock (only for fuels and feedstocks) and processes. As the APME substance nomenclature and the ABB database nomenclature sometimes differ, the original APME substance name is given within "" in the flow metadata Notes field. Please note: Some other interpretations/changes have been made from the original report by Gunnar Mattsson, ABB Corporate Research. See Method and AboutData for details.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography

## About Inventory

### Publication

"Eco-profiles of the European plastics industry", reports for toluene and naphtha.  
 "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999.  
 Reports are available at APME's web site <http://lca.apme.org>.  
 (APME = Association of Plastics Manufacturers in Europe)

	<p>The APME project co-ordinator: Vince Matthews. The members of the original independent expert panel: Ian Boustead, Paul Fink, Horst Langowski, Gustav Sundstrom.</p> <p>-----</p> <p>Editor: Data were entered into the SPINE format by Gunnar Mattsson, ABB Corporate Research, 2001-01-19.</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>Published in SPINE@CPM: 29 October 2001</p> <p>-----</p>
<b>Intended User</b>	<p>1. APME member companies 2. L</p>
<b>General Purpose</b>	<p>The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.</p>
<b>Detailed Purpose</b>	<p>Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.</p> <p>1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes, 2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>
<b>Commissioner</b>	<p>- APME, Association of Plastics Manufacturers in Europe Avenue E. van Nieuwenhuysse 4 Box 3 B-1160 Brussels .</p>
<b>Practitioner</b>	<p>Boustead, Ian - .</p>
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.</p> <p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for toluene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the toluene production processes have been supplied by 10 plants in 4 European countries. Data are probably fairly representative for production of toluene in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p> <p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e.</p>

	<p>each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x {mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes from the original report have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts of Mn, P and Ti resources.</li> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>
<b>Notes</b>	<p>-----</p> <p>--- Changes made to the data set after publishing in SPINE@CPM---</p> <p>&gt;&gt;&gt; 29 October 2001 &lt;&lt;&lt;</p> <p>Changes made by Gunnar Mattson, ABB Corporate Research</p> <p>The general documentation of the data have been supplemented, to improve the transparency and the consistency with other published data sets from the APME reports.</p>

## SPINE LCI dataset: Extraction to xylene APME

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1999
<i>Copyright</i>	APME
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Extraction to xylene APME
<i>Functional Unit</i>	1 kg of xylenes (mixed)
<i>Functional Unit Explanation</i>	Xylene, dimethylbenzene, C <sub>6</sub> H <sub>5</sub> (CH <sub>3</sub> ) <sub>2</sub> , is obtained as a mixture of three isomers, o-xylene, m-xylene and p-xylene, all of which are liquid at room temperature. The mixture is used as an organic solvent; p-xylene is used as a raw material in the production of PET; o-xylene is used in the synthesis of phthalic anhydride.
<i>Process Type</i>	Cradle to gate
<i>Site</i>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<i>Sector</i>	Materials and components
<i>Owner</i>	European average Used for identification of owner and/or site in Object of study under Technical system for activity
<i>Technical system description</i>	<p>Production of xylene including all major operations from extraction of crude oil and gas to catalytic reforming of naphtha, solvent extraction and fractional distillation.</p> <p>Most xylene is produced directly from naphtha by catalytic reforming, a process in which naphthenic compounds in naphtha are dehydrogenated. The basic feedstock is thus converted into a mixture of products, mainly benzene, toluene and xylene; hence, the process is often called the BTX process. Benzene and the other aromatics are isolated in the pure state from the output of the reformer by solvent extraction and fractional distillation.</p> <p>In addition to the mentioned sub-processes, the following major processes are included: Crude oil extraction and delivery; oil refining for naphtha (fractional distillation); natural gas extraction, processing and delivery; coal mining and delivery. Also electricity production and production of other raw materials have been included on a cradle to gate basis, i.e. all materials and energies have been traced back to the extraction of raw materials from the earth.</p> <p>Operating conditions: As the data are based on information from 8 plants in 4 different European countries, the operating conditions differ. For the electricity taken in from the public supply, the calculations have taken account of the country specific electricity production efficiency.</p> <p>Some more information about the processes are found in the "Eco-profiles..." reports for xylenes (mixed) and naphtha, and the Methodology report, which are available at APME's web site <a href="http://lca.apme.org">http://lca.apme.org</a>.</p>

System Boundaries	
<i>Nature Boundary</i>	<p>"The data presented in the result tables are simply a listing of the data for which information is available." Especially for air and water emissions, the magnitude of many of the parameters often depends on the degree of monitoring of the parameter, since a company which does not monitor the parameter, may have estimated it instead.</p> <p>The categories used to identify the different emissions or groups of emissions are empirical and reflect the ability of the many plants to identify specific emissions. For instance, methane, aromatic hydrocarbons and polycyclic hydrocarbons have been identified as separate groups, while the more general name hydrocarbons has been reserved for the remainder. However, some companies may not have reported all of the emissions separately. Therefore, the category metals, for example, may include some metals which were specifically identified by other companies and are included under their specific names elsewhere in the tables. Double-counting has been avoided. However, some of the emissions included separately may have contributed to the BOD and COD values.</p> <p>Generally, the emissions to air and water recorded are those remaining after any on-site air or water treatment.</p> <p>Emissions &lt;0.5 mg were presented as &lt;1 mg in the Eco-profiles result tables. In this</p>

	<p>activity, however, they are presented as 0.25 mg (1/2 of the maximum value 0.5 mg). Note that the actual values may be far below 0.5 mg in some cases.</p> <p>The energy resources Hydrogen and Sulphur have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table.</p>
<b>Time Boundary</b>	Data refer to the years 1990-96. Data for upstream production of fuels and raw materials are probably from the same time, or somewhat older.
<b>Geographical Boundary</b>	<p>European average data. Results are based on data for xylene production plants that produced 720000 tonnes. Data were supplied by 8 plants in 4 countries: Belgium, Germany, Italy and Netherlands.</p> <p>For the APME Eco-profiles in general, the coverage of European production varies from 60 to 100% depending upon the product, although this may not be true for some of the intermediates (including toluene). For the intermediates, with the exception of chlorine, sodium hydroxide and electrolytic hydrogen, the average data might not be truly representative of the European average for their production.</p> <p>The values of some of the parameters reflect the country in which the plants are located. For example, plants in countries where much of the electricity is generated from coal, tend to exhibit higher emissions of sulphur oxides than plants in other countries.</p>
<b>Other Boundaries</b>	<p>The following excluded subsystems are explicitly mentioned in the Methodology report:</p> <ul style="list-style-type: none"> <li>- External incineration of waste and external recycling. Other external waste treatment is, most likely, also excluded, as concluded by the way solid waste is classified. (On-site waste incineration, on the other hand, is included.)</li> <li>- Energy consumption and emissions caused by operating personnel: consumption of food and car transports to work. Both were considered to be small compared to the totals.</li> <li>- Capital equipment and buildings, with two exceptions: road transport and oil well operation. In these two cases, construction and maintenance have been included. In most other cases, the lifetime of the plants is sufficiently long to allow exclusion of capital equipment and buildings, which typically contribute &lt;0.01% to the totals.</li> </ul> <p>No cut-off criteria for exclusion of minor inputs and outputs are stated. However, in the Methodology report, a general recommendation is given that it is important to demonstrate that the contribution of an ancillary material to the overall system is negligible, rather than simply assuming it to be negligible because of its small mass.</p>
<b>Allocations</b>	<p>In the Methodology report and the different "Eco-profiles..." reports, the following co-product allocations are mentioned:</p> <ul style="list-style-type: none"> <li>- Extraction of crude oil and natural gas: For the North Sea oil rigs, the flare losses and the own-use data have been spread over all of the saleable products on the basis of their calorific values.</li> <li>- Refineries: Inputs and outputs have been partitioned over all usable or saleable refinery products on a simple mass basis.</li> <li>- Crackers: Most likely, this also applies to the products from the crackers: ethylene, propylene, butenes etc.</li> <li>- Chlorine plant (electrolysis of sodium chloride): Stoichiometric allocation of sodium chloride and some other inputs and outputs has been applied to the three products: chlorine, sodium hydroxide and hydrogen. Care was taken to attribute inputs or outputs only to the products which derive benefit from these inputs or outputs. E.g., sulphuric acid is used as a drying agent for chlorine; therefore, the sulphuric acid input should be attributed to chlorine only. Electricity was partitioned on all products on a simple mass basis.</li> <li>- Sulphuric acid: 98% sulphuric acid is widely used as a drying agent. Often, the dilute acid leaving the system can be used as a reagent in other reactions. However, the dilute acid cannot simply be subtracted from the input acid. The energy needed to produce concentrated acid by removing water is attributed to the process.</li> <li>- Hydrochloric acid by-product: In many reactions, chlorine is used as an oxidation or chlorination agent, which inevitably results in the formation of HCl as a by-product. Only the inputs and outputs associated with the production of the stoichiometric amounts of chlorine and hydrogen incorporated into the HCl have been assigned to the HCl.</li> <li>- On-site steam and electricity: A primary energy equivalent corresponding to the steam energy, assuming 80% efficiency, was subtracted from the total energy input. The remainder was assigned to the electricity.</li> </ul>
<b>Systems Expansions</b>	Not applied. The amount of Recovered energy is reported as a negative primary energy equivalent input.

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1990 to 1996
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	

<b>Method</b>	European average data. Results are based on data supplied by 8 xylene production plants in 4 countries: Belgium, Germany, Italy and Netherlands. Their total production was 720000 tonnes. Data were averaged over all plants and weighted by the production (mass) from each plant. Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, each production sequence (i.e. each plant + its specific suppliers) is calculated separately, and the final result is the average of the results from the individual production sequences weighted by the output from each production sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations. According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO2 emission. For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m <sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. Emissions and resources <0.5 mg have been assumed by Gunnar Mattson ABB Corporate Research (GM) to be 0.25 mg, i.e. half the "<" values given, which is in accordance with common statistical procedure. The energy resources Hydrogen (0.04 MJ) and Sulphur (<0.01 MJ) have been excluded by GM, since these parameters do not represent true natural resources, but are reported as primary energy equivalents for energy balancing purposes. Probably they are included in other resources, e.g. crude oil and gas. Nuclear energy has been recalculated to natural uranium resource. Only Hydro energy and Unspecified energy are kept as primary energy equivalents in the flow table. 2001-05-31 SECRC/GM
<b>Literature Reference</b>	"Eco-profiles of the European plastics industry", reports for xylenes (mixed) and naphtha. "Eco-profiles of plastics and related intermediates: Methodology", I. Boustead, The European Centre for Plastics in the Environment of The Association of Plastics Manufacturers in Europe (APME), Brussels, 1999. Reports are available at APME's web site <a href="http://Ica.apme.org">http://Ica.apme.org</a> . (APME = Association of Plastics Manufacturers in Europe)
<b>Notes</b>	In the result tables in the "Eco-profiles..." report, not only total fuels and feedstocks, emissions to air and water, and solid waste are presented, but also the amounts caused by fuel production, fuel use, transport, feedstock (only for fuels and feedstocks) and processes. As the APME substance nomenclature and the ABB database nomenclature sometimes differ, the original APME substance name is given within "" in the flow metadata Notes field. Please note: Some other interpretations/changes have been made from the original report by Gunnar Mattson, ABB Corporate Research. See Method and AboutData for details.

### Intended User

1. APME member companies
2. L

### General Purpose

The general purpose of the study was to demonstrate the commitment of APME (Association of Plastics Manufacturers in Europe) to improve the environmental impact of the processes, from extraction of oil to granulate or polymer compound.

<b>Detailed Purpose</b>	<p>Eco-profiles are intended primarily as building blocks for use in the construction of complete life cycle analyses.</p> <p>1) Provide APME member companies with information which will highlight potential areas for improving manufacturing processes,  2) Provide valuable inventory data for downstream users of plastics, such as packaging manufacturers, who will be able to produce their own eco-balance assessments (i.e. LCAs) of individual products.</p> <p>Objectives and areas of application for the Eco-profiles:</p> <ul style="list-style-type: none"> <li>- Plastics waste management studies.</li> <li>- Internal company benchmarking.</li> <li>- Product development. Detailed environmental information to customers of APME members for use in improving the overall environmental performance of products and systems.</li> <li>- Ensuring that the data are neutral.</li> </ul> <p>The purpose of the 1999 update was to re-issue all of the data sets together using the latest data available and with all of the results forming a consistent data set. Significant technological and commercial changes have occurred since 1989-93, the period to which the oldest group of Eco-profile data referred. Also the quality of data reported by the companies has improved since then.</p>

<b>Practitioner</b>	Boustead, Ian - .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data are calculated on a cradle to gate basis, therefore, nuclear power, coal, limestone etc should be regarded as resources from environment, i.e. no supplier activities should be connected to these flows.</p> <p>Remember that, in an LCA, two systems could only be compared if they perform equivalent functions. For instance, production of 1 kg of polyethylene should not be compared directly with production of 1 kg of polycarbonate. Only in a specific application, a comparison between the two materials could be meaningful.</p> <p>It is not reported how large differences there are between different producers with respect to emissions and other environmental impacts. Therefore, it is also not known how well the data could represent production at a specific plant.</p>
<b>About Data</b>	<p>European average data for xylene production on a cradle to gate basis, issued by APME (Association of Plastics Manufacturers in Europe), and produced in association with the independent expert I. Boustead. The companies participating in the project have supplied data on the chemical processes. Data on the xylene production processes have been supplied by 8 plants in 4 European countries. Data are probably fairly representative for production of xylene in Europe. However, the reliability of the data depends on the quality of the records maintained by the individual companies. Mass and energy balances have been checked, and the details of all calculations were referred back to individual companies for checking before being incorporated into the final averages.</p> <p>Data for supporting operations and transport have been obtained from other manufacturers and operators as part of an on-going exercise involved in maintaining an LCI database. The quality of data for public electricity production is not described. However, it is stated that information on the production of fuels and energy have been derived from the reports of the International Energy Agency 1996, which contain data for 1995. No other process data have been derived from the literature.</p> <p>The accuracy of data for materials and energy supplied by companies is considered to be about 5-10%. Wastes and emissions are often measured with less accuracy. Even for a regulated emission, the procedure for measuring and reporting is usually based on sampling rather than continuous monitoring. The accuracy is often unknown. Note that emissions &lt;0.5 mg (0.25 mg in data table) may be far below 0.5 mg in some cases.</p> <p>Vertical averaging has been applied wherever there have been sufficient data from upstream raw material and fuel producers. In vertical averaging, data for each production sequence (i.e. each plant + its specific suppliers) are calculated separately.</p> <p>The final result is the average of the results from the individual production sequences weighted by the output from each sequence (plant). Horizontal averaging has, however, been applied for some processes over which the producers have no control and data from a specific supplier were not available. In these cases, European average data from the other participants or suppliers were used in the calculations.</p> <p>For fuels and feedstock materials, actual gross calorific values (energy content) have been used in the calculations. Typical values: 45.0 MJ/kg for crude oil, 38.8 MJ/m<sup>3</sup> (54.1 MJ/kg) for natural gas, 28.0 MJ/kg for coal, 15.0 MJ/kg for lignite, 9.3 MJ/kg for sulphur. The following degrees of efficiencies have been used to convert electricity production in nuclear plants and hydro plants, respectively, to primary energy equivalents: 35% for nuclear electricity, 80% for hydro electricity.</p> <p>According to the APME methodology report, the amounts of combusted fuels have been corrected by adding the feedstock (gas and oil) residues used as fuel within the processes, before calculating the CO<sub>2</sub> emission. CO<sub>2</sub> emission values have been calculated from the composition of the fuel, assuming complete combustion: CO<sub>2</sub> emission (kg/MJ fuel) = 3.67 x</p>

	<p>{mass fraction of carbon in fuel}/{calorific value of fuel}.</p> <p>The following interpretations/changes from the original report have been made by Gunnar Mattson, ABB Corporate Research:</p> <ul style="list-style-type: none"> <li>- Nuclear energy has been recalculated to natural uranium resource.</li> <li>- Ferromanganese, Phosphate and Rutile have been recalculated to the corresponding amounts of Mn, P and Ti resources.</li> <li>- The energy resources Hydrogen and Sulphur have been excluded, as these parameters do not represent true natural resources.</li> <li>- Emissions and resources &lt;0.5 mg (&lt;1 mg in the Eco-profiles result tables) are presented as 0.25 mg, i.e. 1/2 of the "&lt;" value. This is in accordance with common statistical procedure.</li> </ul>

Technical System	
<b>Name</b>	Extraction, beneficiation and grinding of kieserite
<b>Functional Unit</b>	1 kg of ground kieserite (MgSO <sub>4</sub> *H <sub>2</sub> O).
<b>Functional Unit Explanation</b>	
<b>Process Type</b>	Other
<b>Site</b>	
<b>Sector</b>	Metal and mineral mining
<b>Owner</b>	
<b>Technical system description</b>	<p>This dataset is intended to represent average data for production of kieserite used in production of fertilisers used in Sweden. Data have been given by Kali &amp; Salz in Germany, no specific site has been studied. It is uncertain what techniques for extraction, beneficiation and grinding the data given by Kali &amp; Salz represent.</p> <p>Kieserite is mined simultaneously with potash salt. The text below only gives generic information about extraction and beneficiation of potash salt, the data do not necessarily include these techniques.</p> <p>Information about different techniques of mining and beneficiation of potash salt: Salts deposits were formed by the evaporation of sea water, in which the most important ions are sodium (Na<sup>+</sup>), potassium (K<sup>+</sup>), magnesium (Mg<sup>2+</sup>), calcium (Ca<sup>2+</sup>), chloride (Cl<sup>-</sup>) and sulphate (SO<sub>4</sub><sup>2-</sup>) (Ullmann, vol. A 22, 1993). Beds of potassium-bearing salts, potash salts, exist in different shapes and at varying depths and the largest deposits are found in the United States, in Canada, in the former Soviet Union, in France and in Germany (Encyclopedia of Chemical Processing and Design, vol. 41, 1992, Patyk, 1996). The most important potash mineral is sylvinite, a mixture of sylvite (KCl) and halite or rock salt (NaCl) and so called hard salts, i.e. sylvite (KCl) and kieserite (MgSO<sub>4</sub>*H<sub>2</sub>O) (Phosphorus &amp; Potassium, 1983; Patyk, 1996). Potash minerals are water-soluble and are therefore not found as an outcropping because of the effects of the weather and consequently surface indications of potash are rare or non-existent. Underground deposits have usually been discovered during oil exploration, since both oil and potash salt are sedimentary-type deposits and petroleum companies have been in a better financial position to conduct exploration than potash companies (Encyclopaedia of Chemical Processing and Design, vol. 41, 1992). About 95 % of the potassium salts is destined for the fertiliser industry and potassium chloride is the most important potassium compound in fertilisers (Phosphorus &amp; Potassium, 1983, Patyk, 1996).</p> <p>Extraction of Potash Salt  Shaft Mining  Since mineral salts are very soluble any flow of water from the overlying strata, which</p>

normally are water bearing, must be prevented. When sinking a shaft, this causes difficulties. A technique that involves freezing is currently used to avoid influx of water when sinking a mineshaft. The shaft itself is then protected from the water bearing rocks by the use of segments, made of cast iron or steel-reinforced concrete, bolted together to form rings. The shafts generally have a diameter of 5 -7 meters and the depth can be more than 1000 meters (Ullmann, vol. A 22, 1993).

The mining methods of potash ore depend on its purity and the shape of the deposits, the seams. In horizontal deposits the most common method of extraction is by cutting with heavy machinery and rooms are generally created by removing the salt and pillars are left to support the cover rocks and prevent them from collapsing. Another method of mining in horizontal deposits is longwall mining which is a caving operation (Ullmann, vol. A 22, 1993). Then machines with integral shearers are used, which can work at two different levels concurrently, with the upper face being mined some 25-30 meters ahead of the lower face. Mining faces are supported by self-advancing support systems with prop-chocks installed every 3-5 meters behind the shearer. The latter method was developed to increase the mine output since the room and pillar method left too much of the mineral unreclaimed (Phosphorus & Potassium, 1983).

In steeply dipping deposits the underhand stooping mining systems is the most favoured method. This involves the mining taking place simultaneously at different levels in the salt dome and the spiral roadways connecting the main levels. Often funnelling of ore is practised which implies that ore is dropped by a series of shafts to the lower level and then transported to the foot of the main shaft for removal. This way of transporting the ore is used to minimise the haulage (Phosphorus & Potassium, 1983).

The recovered material is transported by trackless diesel or cable-fed electric loaders. Sometimes conveyor belts and electric or diesel trains are used for transportation along underground roads. Since the introduction of diesel-powered machinery and vehicles, extra attention must be given to ventilation and therefore powerful fans are necessary. Finally, the ore is hoisted in the shaft in the large skips (Ullmann, vol. A 22, 1993).

#### Solution Mining

Solution mining is an alternative method of mining for potash ore, which makes it possible to exploit reserves where conventional mining is impossible, e.g. at great depth. This method eliminates high expense of sinking a shaft and can also be used where existing mine works are available but conventional mining methods are no longer feasible, even though extensive reserves still exist (Ullmann, vol. A 22, 1993). A reason why conventional mining is not possible anymore can be flooding in the mine, too much folding encountered or high occurrence of methane gas in the deposit (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). The principles of the solution mining process are that water or an unsaturated solution of potassium chloride is passed through a system of boreholes into the potash seam. Potassium chloride and sodium chloride are dissolved and the almost saturated solution is then pumped up to the surface and fed to the production plant. The process is based on a series of patents and details have not yet been published (Ullmann, vol. A 22, 1993).

#### Extraction Methods Used in Different Countries

In Germany the potash production is five times the amount sold in the country (Patyk, 1996). The geological conditions vary widely between the northern and the southern regions and, consequently different mining methods are employed to extract the ore. The southern deposits, between the Fulda and Werra rivers, are at easily-accessible levels, but the seams are relatively thin; 1.3 -3.5 m. The potassium content is in the range 7 – 15 % K<sub>2</sub>O. The ore is extracted by conventional mining and the room and pillar method is used in most cases. In the northern Hannover region the potash beds are steeply dipping and folded and the deposits have sometimes the shape of a dome (Ullmann, vol. A 22, 1993). Therefore they are less accessible, but the seam thickness vary between 4 and 30 meters and the K<sub>2</sub>O content is between 13-14 %, on average 3,5 % higher than the southern deposits. The geological conditions in this region favour the underhand stooping mining system (Phosphorus & Potassium, 1983).

In France beds of potassium-bearing salts extend under the Plain of Alsace. Two sylvinite beds are found in three different basins. The upper bed has a K<sub>2</sub>O content of 20-27 % and a thickness of about 1.5 meters, while the lower bed which contains 12-20 % K<sub>2</sub>O is thicker, at about one to five meters. The room and pillar method has been practised for a long time, but in order to increase the mine output longwall is now predominantly used (Fertilizer Manual, 1998).

In the former Soviet Union the potash production is centred around three main regions; the Urals, Belarus and Ukraine (Fertilizer Manual, 1998). The room and pillar method has been extensively used, but nowadays longwall mining is the most frequent system of extraction (Encyclopedia of Chemical Processing and Design, vol. 41, 1992; Ullmann, vol. A 22, 1993).

The room and pillar method has been widely used for mining of potash ore in the United States. However, some mines has been converted to solution mining, e.g. a mine in Utah where conventional mining operations had to be terminated due to severe technological and geological problems (Encyclopedia of Chemical Processing and Design, vol. 41, 1992; Ullmann, vol. A 22, 1993).

In Canada solution mining and the room and pillar method are practised. Mining in Saskatchewan, Canada is relatively clean and straightforward since the evaporite beds are regular, tabular and relatively untilted (Encyclopedia of Chemical Processing and Design, vol. 41, 1992).

#### Beneficiation of Potash Ore

In order to increase the concentration of potassium chloride to 95 % three different beneficiation techniques are mainly applied in the potash industry; flotation, thermal dissolution-crystallisation or hot leaching and electrostatic separation (Patyk, 1996).

The salt minerals in potash ores are intergrown with other salt minerals to varying extents. The most important minerals are sylvinite, sylvite mixed with halite, and so-called hard salts, sylvite and kieserite (Patyk, 1996). Therefore the ore must be sufficiently reduced in size, so that individual components are accessible, before the minerals can be separated and the useful components recovered. Potash salts are relatively easily size-reduced by grinding. In the hot leaching process potassium chloride is extracted and must therefore not be occluded inside other minerals, which implies an upper grain size limit of 4-5 mm. For the mechanical processes, i.e. flotation and electrostatic separation, liberation of the minerals must be complete, which means that individual grains must consist as much as possible of pure minerals. For German sylvinite ores and hard salts, this is achieved by grinding to a maximum grain size of 0.8-1.0 mm, but for coarser sylvinite ores of, for example, Saskatchewan, Canada a size reduction to < 9 mm would give an adequate liberation (Ullmann, vol. A 22, 1993).

#### Flotation

Flotation essentially relies on the fact that fresh mineral surfaces can be induced to adopt either a hydrophobic or hydrophilic attitude in the solution by conditioning with specific surface chemicals. Air bubbles are then introduced into the solution and the mineral particles will, if they are hydrophobic, attach themselves to air bubbles at the air/water interface and float up to the top where they can be mechanically removed (Fertilizer Manual, 1998). Common collectors are hydrochloride and acetate salts of aliphatic amides with a carbon chain length of 12-24. Frothers are often added before the slurry enters the flotation cell (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). The flotation process has advantages over other processes, in particular the crystallisation process, in that total energy consumption is generally lower and maintenance and equipment depreciation charges generally less than for other comparable processes (Fertiliser Manual, 1998).

#### Dissolution-Crystallisation or Hot Leaching

The basis of the dissolution-crystallisation method of beneficiation, even called the hot leaching process, lies in the fact that potassium chloride is very much more soluble in hot water than in cold, whereas sodium chloride is only slightly more soluble at 100°C than at 20°C. In solutions saturated with respect to both sodium and potassium chloride, sodium chloride is actually less soluble at higher temperatures. Firstly, the sylvinite ore is crushed and washed with cool, saturated sodium/potassium chloride solution. Clay is removed and the clarified solution is then heated and used to dissolve the potassium chloride in the washed ore. Any undissolved sodium chloride is discarded as tailings. Finally, the solution is cooled under vacuum, which results in the crystallisation of potassium chloride and the crystals are separated, washed and dried (Fertilizer Manual, 1998). The remaining brine, mostly sodium chloride, is recirculated and heat exchangers recover valuable heat. A major cost in this process is the heating of the cool mother liquid from the crystalliser before recycling it to the dissolution stage (Phosphorus & Potassium, 1983). However, this method was used before the introduction of flotation in the mid-1930s and it is to prefer when the ores are excessively high in either clay or carnallite (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Electrostatic Separation

Electrostatic separation is a dry technique in which a mixture of minerals may be differentiated according to their electrical conductivity. For potash minerals, which are not naturally conductive, the separation must be preceded by a conditioning step that induces the minerals to carry electrostatic charges of different magnitude and, if possible, different polarities. In Germany, the researchers have developed a process for dry beneficiation of complex potash ores. Particle size, conditioning agents, and relative humidity are used in the electrostatic separation zones to separate ore into three fractions (Fertiliser Manual, 1998). The components are separated in stages, using up to four stages and the particles pass direct from one stage to another. The company that has developed this process, Kali und Salz GmbH, is silent about the process, but a stage seems to be two rows of tubes, 25 cm apart and 2.5 m long, at 100 kV direct current. Using this process for beneficiation, all the energy that is consumed when drying out the potash beneficiated by wet means is saved and tailings disposal problems associated with alternative wet separation processes eliminated (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Methods of Beneficiation used in Different Countries

In Germany the hot leaching process is the dominating method of beneficiation of potash ores (Ullmann, vol. A 22, 1993). Electrostatic separation is also used to a large extent (Fertilizer Manual, 1998).

Flotation is used at one plant in France and the hot leaching process is practised at the two remaining ones (Fertilizer Manual, 1998; Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

In Spain and in the United Kingdom flotation is used exclusively for the separation of potassium chloride from sodium chloride (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

In the former Soviet Union the hot leaching process is still a widely used method for beneficiation of potash ores, especially in old plants. Generally the flotation process is used in new installations, except when potash ores contain high levels of clay or when magnesium chloride levels exceed 30 % (Phosphorus & Potassium, 1983).

In Canada and in the United States flotation is predominantly used as the main product process, except for the two solution mines (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). In some plants, especially in Canada small hot leaching plants are also operated, in which product fines are recrystallised or potassium chloride is extracted and crystallised from the flotation residues and clay slurries (Ullmann, vol. A 22, 1993).

Potassium chloride and potassium sulphate are also produced from brines on commercial basis from six sources in the world, including two lakes, the Great Salt Lake in Utah and the Dead Sea between Israel and Jordan; two subsurface brine sources, one in California and one in Utah; two solution mines, one in Utah and one in Saskatchewan, Canada. Potassium sulphate is produced from the Great Salt Lake and the subsurface brine in California and potassium chloride is produced from all brines except the one from Great Salt Lake. Brines from the sources in Saskatchewan and in California are concentrated in multiple-effect evaporators and crystals of the final product are grown in multiple-stage vacuum crystallisers. The brine from the other sources is concentrated by solar evaporation (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Environmental Aspects

In addition to the consumption of energy, the main environmental problem of the potash industry is disposal of process waste (Ullmann, vol. A 22, 1993). When processing potash ore to saleable product three types of waste products are generated; liquid and solid salt tailings, insolubles or slimes and dust. Salt tailings are generally the major environmental concern and the composition of the waste depends on the type of ore treated. Waste from sylvinite processing consists mainly of halite, waste from treatment of hard salts are halite and kieserite and from treatment of carnallitic ore are halite and carnallite (Phosphorus & Potassium, 1983; Ullmann, vol. A 22, 1993). Concentrated salt is a toxic waste which does not decay and requires dilution in order to be non-toxic (Phosphorus & Potassium, 1983).

There are four methods for disposing of waste; stacking, backfilling, pumping into the ground and discharge into natural water systems (Ullmann, vol. A 22, 1993). Until recently, plants merely stacked their waste salts and slimes and injected the excess brine underground, or dumped both into the nearest river. New plants have been required to eliminate these practices (Fertilizer Manual, 1998). In case of stacking, measures must be taken so that salt solutions that run off the deposited material, such as solid salt tailings and insolubles, not harm the environment when they are absorbed into the ground. If the ground underneath the stack is not impermeable, layers of clay or plastic sheets must seal it. In Germany, the solid waste is formed into steep conical heaps in order to decrease the amount of run off water formed by rainfall and to minimise the required ground area. If mining methods are suitable and certain geological requirements are met solid waste can be backfilled in the mines. This is the main method of waste disposal in the potash works in the northern Germany, where the salt beds are steeply inclined and this method is also practised in some mines in Canada. However, backfilling is not possible for technical and economic reasons in most potash works (Ullmann, vol. A 22, 1993).

Under certain geological conditions it is possible to pump salt solutions back into the ground. For this purpose the formation used must possess sufficient porosity and permeability and must have no contact with water bearing formations. For example, in the Werra potash region of Germany large quantities of brines have been pumped into a porous dolomite layer. However, in this region the amount of brines produced has decreased drastically since the introduction of electrostatic separation of potash ore. This beneficiation process was developed in the aim of reducing the amount of liquid salt tailings (Ullmann, vol. A 22, 1993). Sea disposal is practised in the United Kingdom (Fertilizer Manual, 1998) and by one of the works in Canada and presents few major problems if the outlet is sufficiently far away from the coast. The potash works on the Dead Sea can dispose waste brine in the Dead Sea itself, without problems since the waste brine is more diluted than the water in the Dead Sea. For most potash works, waste brines must be disposed into natural flowing water since neither underground disposal nor disposal in seawater is possible. This is strictly regulated in most countries, but although, for example, the salt halt in the Werra River, Germany is very high due to the potash works in the eastern part of the Werra region (Ullmann, vol. A 22, 1993).

The only important atmospheric pollution caused by the production of potassium salts is dust emitted from the drying plant and from the handling of the ore and the products (Ullmann, vol. A 22, 1993). Such emissions contain primarily a mixture of potassium chloride and sodium chloride and deposition of the dust may be beneficial or hazardous to soil productivity depending on the level of emissions (Phosphorus & Potassium, 1983).

System Boundaries	
<b>Nature Boundary</b>	The system starts with extraction and ends with ground kieserite leaving the beneficiation site. Energy consumption for extraction and emissions from combustion of natural gas are not included.
<b>Time Boundary</b>	The data were given by Kali & Salz in 1998.
<b>Geographical Boundary</b>	The extraction, beneficiation and grinding takes place in Germany.
<b>Other Boundaries</b>	Energy consumption for extraction and emissions from combustion of natural gas are not included.
<b>Allocations</b>	Not applicable.
<b>Systems Expansions</b>	Not applicable.

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	
<b>Method</b>	Information was taken from personal communication with Mr Aselmeyer at Kali & Salz in Germany.
<b>Literature Reference</b>	Personal communication: Aselmeyer F-B (1998). Kali und Salz GmbH, Kassel, Germany. tel: +49-561-301-2224.
<b>Notes</b>	In the result tables in the "Eco-profiles..." report, not only total fuels and feedstocks, emissions to air and water, and solid waste are presented, but also the amounts caused by fuel production, fuel use, transport, feedstock (only for fuels and feedstocks) and processes. As the APME substance nomenclature and the ABB database nomenclature sometimes differ, the original APME substance name is given within "" in the flow metadata Notes field. Please note: Some other interpretations/changes have been made from the original report by Gunnar Mattson, ABB Corporate Research. See Method and AboutData for details.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Natural resource	Potash salt				kg	Ground	Germany
Notes: The energy input given by Kali & Salz is stated as being mostly natural gas.	Input	Refined resource	Natural gas	1.1			MJ	Technosphere	Germany
Notes: Kieserite (MgSO <sub>4</sub> *H <sub>2</sub> O).	Output	Product	Kieserite	1			kg	Technosphere	Germany

About Inventory	
<b>Publication</b>	<p>Davis J, Haglund C (1999). "Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe". SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden.</p> <p>-----</p> <p>Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology).</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	The dataset is intended to be
<b>General Purpose</b>	To generate an inventory of emissions and use of resources due to the production of fertilisers used in Sweden.
<b>Detailed Purpose</b>	The purpose was not to compare production of different fertilisers with each other but to generate a thorough inventory of emissions and use of resources due to the production of fertilisers used in Sweden. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems. Production of kieserite is one step in the line of production of some of the fertilisers containing potassium produced in Sweden.
<b>Commissioner</b>	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
<b>Practitioner</b>	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
<b>Reviewer</b>	-

<b>Applicability</b>	The dataset is applicable for extraction, beneficiation and grinding of kieserite in Germany. It is included in aggregated datasets for production of fertilisers at Hydro Agri AB in Köping, Sweden (cradle to gate).
<b>About Data</b>	The data are given by Kali und Salz in Germany. No information on process emissions during extraction, beneficiation and grinding was given.
<b>Notes</b>	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of Technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

The text below only gives generic information about extraction and beneficiation of potash salt, the data do not necessarily include these techniques.</p> <p>Salts deposits were formed by the evaporation of sea water, in which the most important ions are sodium (Na<sup>+</sup>), potassium (K<sup>+</sup>), magnesium (Mg<sup>2+</sup>), calcium (Ca<sup>2+</sup>), chloride (Cl<sup>-</sup>) and sulphate (SO<sub>4</sub><sup>2-</sup>) (Ullmann, vol. A 22, 1993). Beds of potassium-bearing salts, potash salts, exist in different shapes and at varying depths and the largest deposits are found in the United States, in Canada, in the former Soviet Union, in France and in Germany (Encyclopedia of Chemical Processing and Design, vol. 41, 1992, Patyk, 1996). The most important potash mineral is sylvinit, a mixture of sylvite (KCl) and halite or rock salt (NaCl) and so called hard salts, i.e. sylvite (KCl) and kieserite (MgSO<sub>4</sub>·H<sub>2</sub>O) (Phosphorus &amp; Potassium, 1983; Patyk, 1996). Potash minerals are water-soluble and are therefore not found as an outcropping because of the effects of the weather and consequently surface indications of potash are rare or non-existent. Underground deposits have usually been discovered during oil exploration, since both oil and potash salt are sedimentary-type deposits and petroleum companies have been in a better financial position to conduct exploration than potash companies (Encyclopaedia of Chemical Processing and Design, vol. 41, 1992). About 95 % of the potassium salts is destined for the fertiliser industry and potassium chloride is the most important potassium compound in fertilisers (Phosphorus &amp; Potassium, 1983, Patyk, 1996).</p> <p>Extraction of Potash Salt Shaft Mining Since mineral salts are very soluble any flow of water from the overlying strata, which normally are water bearing, must be prevented. When sinking a shaft, this causes difficulties. A technique that involves freezing is currently used to avoid influx of water when sinking a mineshaft. The shaft itself is then protected from the water bearing rocks by the use of segments, made of cast iron or steel-reinforced concrete, bolted together to form rings. The shafts generally have a diameter of 5 -7 meters and the depth can be more than</p>

1000 meters (Ullmann, vol. A 22, 1993).

The mining methods of potash ore depend on its purity and the shape of the deposits, the seams. In horizontal deposits the most common method of extraction is by cutting with heavy machinery and rooms are generally created by removing the salt and pillars are left to support the cover rocks and prevent them from collapsing. Another method of mining in horizontal deposits is longwall mining which is a caving operation (Ullmann, vol. A 22, 1993). Then machines with integral shearers are used, which can work at two different levels concurrently, with the upper face being mined some 25-30 meters ahead of the lower face. Mining faces are supported by self-advancing support systems with prop-chocks installed every 3-5 meters behind the shearer. The latter method was developed to increase the mine output since the room and pillar method left too much of the mineral unreclaimed (Phosphorus & Potassium, 1983).

In steeply dipping deposits the underhand stooping mining systems is the most favoured method. This involves the mining taking place simultaneously at different levels in the salt dome and the spiral roadways connecting the main levels. Often funnelling of ore is practised which implies that ore is dropped by a series of shafts to the lower level and then transported to the foot of the main shaft for removal. This way of transporting the ore is used to minimise the haulage (Phosphorus & Potassium, 1983).

The recovered material is transported by trackless diesel or cable-fed electric loaders. Sometimes conveyor belts and electric or diesel trains are used for transportation along underground roads. Since the introduction of diesel-powered machinery and vehicles, extra attention must be given to ventilation and therefore powerful fans are necessary. Finally, the ore is hoisted in the shaft in the large skips (Ullmann, vol. A 22, 1993).

#### Solution Mining

Solution mining is an alternative method of mining for potash ore, which makes it possible to exploit reserves where conventional mining is impossible, e.g. at great depth. This method eliminates high expense of sinking a shaft and can also be used where existing mine works are available but conventional mining methods are no longer feasible, even though extensive reserves still exist (Ullmann, vol. A 22, 1993). A reason why conventional mining is not possible anymore can be flooding in the mine, too much folding encountered or high occurrence of methane gas in the deposit (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). The principles of the solution mining process are that water or an unsaturated solution of potassium chloride is passed through a system of boreholes into the potash seam. Potassium chloride and sodium chloride are dissolved and the almost saturated solution is then pumped up to the surface and fed to the production plant. The process is based on a series of patents and details have not yet been published (Ullmann, vol. A 22, 1993).

#### Extraction Methods Used in Different Countries

In Germany the potash production is five times the amount sold in the country (Patyk, 1996). The geological conditions vary widely between the northern and the southern regions and, consequently different mining methods are employed to extract the ore. The southern deposits, between the Fulda and Werra rivers, are at easily-accessible levels, but the seams are relatively thin; 1.3 -3.5 m. The potassium content is in the range 7 – 15 % K<sub>2</sub>O. The ore is extracted by conventional mining and the room and pillar method is used in most cases. In the northern Hannover region the potash beds are steeply dipping and folded and the deposits have sometimes the shape of a dome (Ullmann, vol. A 22, 1993). Therefore they are less accessible, but the seam thickness vary between 4 and 30 meters and the K<sub>2</sub>O content is between 13-14 %, on average 3,5 % higher than the southern deposits. The geological conditions in this region favour the underhand stooping mining system (Phosphorus & Potassium, 1983).

In France beds of potassium-bearing salts extend under the Plain of Alsace. Two sylvinite beds are found in three different basins. The upper bed has a K<sub>2</sub>O content of 20-27 % and a thickness of about 1.5 meters, while the lower bed which contains 12-20 % K<sub>2</sub>O is thicker, at about one to five meters. The room and pillar method has been practised for a long time, but in order to increase the mine output longwall is now predominantly used (Fertilizer Manual, 1998).

In the former Soviet Union the potash production is centred around three main regions; the Urals, Belarus and Ukraine (Fertilizer Manual, 1998). The room and pillar method has been extensively used, but nowadays longwall mining is the most frequent system of extraction (Encyclopedia of Chemical Processing and Design, vol. 41, 1992; Ullmann, vol. A 22, 1993).

The room and pillar method has been widely used for mining of potash ore in the United States. However, some mines has been converted to solution mining, e.g. a mine in Utah where conventional mining operations had to be terminated due to severe technological and geological problems (Encyclopedia of Chemical Processing and Design, vol. 41, 1992; Ullmann, vol. A 22, 1993).

In Canada solution mining and the room and pillar method are practised. Mining in Saskatchewan, Canada is relatively clean and straightforward since the evaporite beds are regular, tabular and relatively untilted (Encyclopedia of Chemical Processing and Design, vol. 41, 1992).

#### Beneficiation of Potash Ore

In order to increase the concentration of potassium chloride to 95 % three different beneficiation techniques are mainly applied in the potash industry; flotation, thermal dissolution-crystallisation or hot leaching and electrostatic separation (Patyk, 1996).

The salt minerals in potash ores are intergrown with other salt minerals to varying extents. The most important minerals are sylvinite, sylvite mixed with halite, and so-called hard salts, sylvite and kieserite (Patyk, 1996). Therefore the ore must be sufficiently reduced in size, so that individual components are accessible, before the minerals can be separated and the useful components recovered. Potash salts are relatively easily size-reduced by grinding. In the hot leaching process potassium chloride is extracted and must therefore not be occluded inside other minerals, which implies an upper grain size limit of 4-5 mm. For the mechanical processes, i.e. flotation and electrostatic separation, liberation of the minerals must be complete, which means that individual grains must consist as much as possible of pure minerals. For German sylvinite ores and hard salts, this is achieved by grinding to a maximum grain size of 0.8-1.0 mm, but for coarser sylvinite ores of, for example, Saskatchewan, Canada a size reduction to < 9 mm would give an adequate liberation (Ullmann, vol. A 22, 1993).

#### Flotation

Flotation essentially relies on the fact that fresh mineral surfaces can be induced to adopt either a hydrophobic or hydrophilic attitude in the solution by conditioning with specific surface chemicals. Air bubbles are then introduced into the solution and the mineral particles will, if they are hydrophobic, attach themselves to air bubbles at the air/water interface and float up to the top where they can be mechanically removed (Fertilizer Manual, 1998). Common collectors are hydrochloride and acetate salts of aliphatic amides with a carbon chain length of 12-24. Frothers are often added before the slurry enters the flotation cell (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). The flotation process has advantages over other processes, in particular the crystallisation process, in that total energy consumption is generally lower and maintenance and equipment depreciation charges generally less than for other comparable processes (Fertiliser Manual, 1998).

#### Dissolution-Crystallisation or Hot Leaching

The basis of the dissolution-crystallisation method of beneficiation, even called the hot leaching process, lies in the fact that potassium chloride is very much more soluble in hot water than in cold, whereas sodium chloride is only slightly more soluble at 100°C than at 20°C. In solutions saturated with respect to both sodium and potassium chloride, sodium chloride is actually less soluble at higher temperatures. Firstly, the sylvinite ore is crushed and washed with cool, saturated sodium/potassium chloride solution. Clay is removed and the clarified solution is then heated and used to dissolve the potassium chloride in the washed ore. Any undissolved sodium chloride is discarded as tailings. Finally, the solution is cooled under vacuum, which results in the crystallisation of potassium chloride and the crystals are separated, washed and dried (Fertilizer Manual, 1998). The remaining brine, mostly sodium chloride, is recirculated and heat exchangers recover valuable heat. A major cost in this process is the heating of the cool mother liquid from the crystalliser before recycling it to the dissolution stage (Phosphorus & Potassium, 1983). However, this method was used before the introduction of flotation in the mid-1930s and it is to prefer when the ores are excessively high in either clay or carnallite (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Electrostatic Separation

Electrostatic separation is a dry technique in which a mixture of minerals may be differentiated according to their electrical conductivity. For potash minerals, which are not naturally conductive, the separation must be preceded by a conditioning step that induces the minerals to carry electrostatic charges of different magnitude and, if possible, different polarities. In Germany, the researchers have developed a process for dry beneficiation of complex potash ores. Particle size, conditioning agents, and relative humidity are used in the electrostatic separation zones to separate ore into three fractions (Fertiliser Manual, 1998). The components are separated in stages, using up to four stages and the particles pass direct from one stage to another. The company that has developed this process, Kali und Salz GmbH, is silent about the process, but a stage seems to be two rows of tubes, 25 cm apart and 2.5 m long, at 100 kV direct current. Using this process for beneficiation, all the energy that is consumed when drying out the potash beneficiated by wet means is saved and tailings disposal problems associated with alternative wet separation processes eliminated (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Methods of Beneficiation used in Different Countries

In Germany the hot leaching process is the dominating method of beneficiation of potash ores (Ullmann, vol. A 22, 1993). Electrostatic separation is also used to a large extent (Fertilizer Manual, 1998).

Flotation is used at one plant in France and the hot leaching process is practised at the two remaining ones (Fertilizer Manual, 1998; Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

In Spain and in the United Kingdom flotation is used exclusively for the separation of potassium chloride from sodium chloride (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

In the former Soviet Union the hot leaching process is still a widely used method for beneficiation of potash ores, especially in old plants. Generally the flotation process is used in new installations, except when potash ores contain high levels of clay or when magnesium chloride levels exceed 30 % (Phosphorus & Potassium, 1983).

In Canada and in the United States flotation is predominantly used as the main product process, except for the two solution mines (Encyclopedia of Chemical Processes and Design, vol. 41, 1992). In some plants, especially in Canada small hot leaching plants are also operated, in which product fines are recrystallised or potassium chloride is extracted and crystallised from the flotation residues and clay slurries (Ullmann, vol. A 22, 1993).

Potassium chloride and potassium sulphate are also produced from brines on commercial basis from six sources in the world, including two lakes, the Great Salt Lake in Utah and the Dead Sea between Israel and Jordan; two subsurface brine sources, one in California and one in Utah; two solution mines, one in Utah and one in Saskatchewan, Canada. Potassium sulphate is produced from the Great Salt Lake and the subsurface brine in California and potassium chloride is produced from all brines except the one from Great Salt Lake. Brines from the sources in Saskatchewan and in California are concentrated in multiple-effect evaporators and crystals of the final product are grown in multiple-stage vacuum crystallisers. The brine from the other sources is concentrated by solar evaporation (Encyclopedia of Chemical Processes and Design, vol. 41, 1992).

#### Environmental Aspects

In addition to the consumption of energy, the main environmental problem of the potash industry is disposal of process waste (Ullmann, vol. A 22, 1993). When processing potash ore to saleable product three types of waste products are generated; liquid and solid salt tailings, insolubles or slimes and dust. Salt tailings are generally the major environmental concern and the composition of the waste depends on the type of ore treated. Waste from sylvinitic processing consists mainly of halite, waste from treatment of hard salts are halite and Kieserite and from treatment of carnallitic ore are halite and carnallite (Phosphorus & Potassium, 1983; Ullmann, vol. A 22, 1993). Concentrated salt is a toxic waste which does not decay and requires dilution in order to be non-toxic (Phosphorus & Potassium, 1983).

There are four methods for disposing of waste; stacking, backfilling, pumping into the ground and discharge into natural water systems (Ullmann, vol. A 22, 1993). Until recently, plants merely stacked their waste salts and slimes and injected the excess brine underground, or dumped both into the nearest river. New plants have been required to eliminate these practices (Fertilizer Manual, 1998). In case of stacking, measures must be taken so that salt solutions that run off the deposited material, such as solid salt tailings and insolubles, not harm the environment when they are absorbed into the ground. If the ground underneath the stack is not impermeable, layers of clay or plastic sheets must seal it. In Germany, the solid waste is formed into steep conical heaps in order to decrease the amount of run off water formed by rainfall and to minimise the required ground area. If mining methods are suitable and certain geological requirements are met solid waste can be backfilled in the mines. This is the main method of waste disposal in the potash works in the northern Germany, where the salt beds are steeply inclined and this method is also practised in some mines in Canada. However, backfilling is not possible for technical and economic reasons in most potash works (Ullmann, vol. A 22, 1993).

Under certain geological conditions it is possible to pump salt solutions back into the ground. For this purpose the formation used must possess sufficient porosity and permeability and must have no contact with water bearing formations. For example, in the Werra potash region of Germany large quantities of brines have been pumped into a porous dolomite layer. However, in this region the amount of brines produced has decreased drastically since the introduction of electrostatic separation of potash ore. This beneficiation process was developed in the aim of reducing the amount of liquid salt tailings (Ullmann, vol. A 22, 1993). Sea disposal is practised in the United Kingdom (Fertilizer Manual, 1998) and by one of the works in Canada and presents few major problems if the outlet is sufficiently far away from the coast. The potash works on the Dead Sea can dispose waste brine in the Dead Sea itself, without problems since the waste brine is more diluted than the water in the Dead Sea. For most potash works, waste brines must be disposed into natural flowing water since neither underground disposal nor disposal in seawater is possible. This is strictly regulated in most countries, but although, for example, the salt halt in the Werra River, Germany is very high due to the potash works in the eastern part of the Werra region (Ullmann, vol. A 22, 1993).

The only important atmospheric pollution caused by the production of potassium salts is dust emitted from the drying plant and from the handling of the ore and the products (Ullmann, vol. A 22, 1993). Such emissions contain primarily a mixture of potassium chloride and sodium chloride and deposition of the dust may be beneficial or hazardous to soil productivity depending on the level of emissions (Phosphorus & Potassium, 1983).

<b>About Inventory</b>	
<b>Publication</b>	<p>Davis J, Haglund C (1999). "Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe". SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden.</p> <p>-----</p> <p>Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology).</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	The dataset is intended to be
<b>General Purpose</b>	To generate an inventory of emissions and use of resources due to the production of fertilisers used in Sweden.
<b>Detailed Purpose</b>	The purpose was not to compare production of different fertilisers to each other but to generate a thorough inventory of emissions and use of resources due to the production of fertilisers used in Sweden. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems. Production of potassium chloride is one step in the line of production of fertilisers containing potassium produced in Sweden.
<b>Commissioner</b>	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
<b>Practitioner</b>	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
<b>Reviewer</b>	-
<b>Applicability</b>	The dataset is applicable for extraction, beneficiation and grinding of potash salt in Germany. It is included in aggregated datasets for production of fertilisers at Hydro Agri AB in Köping (cradle to gate).
<b>About Data</b>	The data are given by Kali und Salz in Germany. No information on process emissions during extraction, beneficiation and grinding was given.

<b>Notes</b>	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of Technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

## SPINE LCI dataset: Ferry

### Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	1998 08
<b>Copyright</b>	NTM
<b>Availability</b>	Public

### Technical System

<b>Name</b>	Ferry
<b>Functional Unit</b>	1 tonkm
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 50 % for tankers, 80 % for RoRo vessels and 60% for other vessels. This is considered representative for traffic to/from Sweden. <i>empty trips are included.</i>
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Sea transport

<b>Owner</b>	Sweden
<b>Technical system description</b>	Operation of ferry, of the type that plies to Denmark and Finland, with a utilisation level of 60% by weight.

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents the fleet in 1999.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 50 % for tankers, 80% for RoRo vessels and 60% for other vessels 60% (including empty trips)</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions e.g. climate etc.</li> <li>-Maintenance level of the vessel</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Precombustion, i.e. production and distribution of the fuel.</li> <li>-Maintenance of the vessel (e.g. use of anti fouling)</li> <li>-After-treatment of the vessel</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	<p>The energy use and emissions have been allocated between passengers and goods according to a method described in Sjöbris A. Flodström, E. "Emissions och energivärderingsprinciper för transportsystem" KFB rapport 1994:9, 1994</p> <p>The method is based on the argument that if there were no passengers, the cargo would be transported with a RoRo vessel of the same size. The goods is charged with the amount of energy use and emissions if it had been transported with a RoRo vessel of the same size, and the passengers are charged with the remaining energy use and emissions. The cargo then account for approx. 20 % of the total energy use and emissions of the ferry.</p>
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1998 - 09
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>All vessels larger than 300 tons gross tonnage in the Swedish Shipowners' Association's register have been used as a basis for the data. For each individual ship, the load capacity (in dwt), installed engine effect (in kW) (Redareföreningen 1995) and speed (in knots) have been used as a basis. The emissions have been calculated on the basis of the distribution of low and high revolution engines among the different size classes, and the emission factors of the engines (Alexandersson et al 1991), see table below. The energy use has been calculated with the assumption of an oil consumption of 200 g/kWh for both low and medium revolution engines. The emission factors below are given in g/kWh, where kWh refer to mechanical work done by the engine. Engine type Load NOx CO CO2 THC PM Low rev 80% 17,7 0,2 600 0,8 0,9 Medium rev 80% 14 1 620 0,2 0,4 The utilisation levels used in these calculations are as follows: Tank 0,5 Bulk 0,6 RoRo 0,8 LoLo 0,6 Ferry 0,6 Others 0,6 The calculations of emissions from shipping are made according to the following principle: emission factor = spec.emission x effect x 1 x 1 speed load capacity utilisation level The <i>quantity value</i> for all parameters is an average of all vessels in the population. The <i>minimum value</i> corresponds to the individual with the lowest energy use and emissions in the population, and the <i>maximum value</i> to the individual with the largest energy use and emissions in the population.</p>
<b>Literature Reference</b>	<p>Alexandersson, A., <i>Sjöfartens utsläpp av avgaser</i>, MariTerm, TFB-rapport 1991:18 Demker, G. et al. <i>Miljöeffekter av transportmedelsval för godstransporter</i>, MariTerm, KFB-rapport, 1994:6 <i>Skeppsregister 1995</i>, Swedish Shipowner Association Sjöbris, A., Flodström, E. <i>Emissions och energivärderingsprinciper för transportsystem</i>, MariTerm, KFB-rapport 1994:9 <i>Lloyds list</i>, 1996</p>
<b>Notes</b>	The energy use and emissions from ferries vary greatly. The result depend on calculation method, size of the ship, speed, route, age of the ship, fuel etc. Swedish Shipowners Association are working on an updated and more detailed version of emission data from ferries.

	Output	Emission	SO2	0.099	0.0175	0.201	g	Air	Sweden

About Inventory	
<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value</p>

	<p>since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	Sörheim, Elisabet - Swedish Shipowners Association .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p>Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners ´ Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners ´ Association or from the operators.</p> <p><b>Type of vessels</b></p> <p><i>Cargo Vessles</i> - includes all vessels except RoRo vessels and ferries. Cargo Vessles thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Cargo Vessles are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other Cargo vessels.</p> <p><i>RoRo vessels</i> are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular Cargo vessels.</p> <p><i>Ferries</i> carry both passengers and goods. The goods are carried in trucks, trailers or trains.</p> <p><b>Fuel</b></p> <p>The fuel quality vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use cleaner fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used.</p> <p><b>Reduction of emissions</b></p> <p>The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions.</p> <p><b>Bulky goods</b></p> <p>Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Travelled distance</b></p> <p>The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done.</p> <p><b>International sea transports</b></p> <p>When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.</p> <p>The utilisation levels used in these calculations are as follows:</p> <p>Tank 0,5 Bulk 0,6 RoRo 0,8 LoLo 0,6 Ferry 0,6 Others 0,6</p>

<b>About Data</b>	<p>Data have been calculated on the basis of the load capacity (in dwt), installed engine effect (in kW) (Redareföreningen) and speed (in knots) (Lloyds) of each individual ship. Emissions to air per tonkm have been calculated by using the emission factors of the engines (Alexandersson et.al. 1991), see table below, and by knowing the relation of low and medium revolution engines to different sizes of ships.</p> <p>The emission factors below are given in g/kWh, where kWh refer to mechanical work done by the engine.</p> <table><tr><td>Engine type</td><td>Load</td><td>NOx</td><td>CO</td><td>CO2</td><td>THC</td><td>PM</td></tr><tr><td>Low rev 80%</td><td>17,7</td><td>0,2</td><td>600</td><td>0,8</td><td>0,9</td><td></td></tr><tr><td>Medium rev 80%</td><td>14</td><td>1</td><td>620</td><td>0,2</td><td>0,4</td><td></td></tr></table> <p>The energy consumption has been calculated by the assumption of an oil consumption of 200g/kWh for both low and medium revolution engines.</p> <p>The sulphurous content of the fuel is assumed to be 0.5% for ferries (Sjöbris 1994).</p> <p>N.B. In this example, the load carrier is also counted as load!</p> <p>See also: Allocations.</p>	Engine type	Load	NOx	CO	CO2	THC	PM	Low rev 80%	17,7	0,2	600	0,8	0,9		Medium rev 80%	14	1	620	0,2	0,4

Medium rev 80%	14	1	620	0,2	0,4																	
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for transportation by boat in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>																					

SPINE Data Report © SLC, Chalmers University of Technology, 2020 SLC - the Swedish life cycle center

## SPINE LCI dataset: Ferry, 700-7000 tonnes

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Ferry, 700-7000 tonnes
<b>Functional Unit</b>	1 tonkm, 60 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 60%. An utilisation level of 60% is representative for Swedish domestic traffic if <i>empty trips are included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Sea transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	Operation i.e. propulsion of Swedish flagged ferries carrying both passengers and cargo, which are members of the Swedish Shipowners' Association. The loading capacity is 700 - 7000 tonnes.

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents the fleet in 1997
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 60% (including empty trips).</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions e.g. climate etc.</li> <li>-Maintenance level of the vessel</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Precombustion, i.e. production and distribution of the fuel.</li> <li>-Maintenance of the vessel (e.g. use of anti fouling)</li> <li>-After-treatment of the vessel</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	<p>The energy use and emissions have been allocated between passengers and goods according to a method described in Sjöbris A. Flodström, E. "Emissions och energivärderingsprinciper för transportsystem" KFB rapport 1994:9, 1994</p> <p>The method is based on the argument that if there were no passengers, the cargo would be transported with a RoRo vessel of the same size. The goods is charged with the amount of energy use and emissions if it had been transported with a RoRo vessel of the same size, and the passengers are charged with the remaining energy use and emissions. The cargo then account for approx. 20 % of the total energy use and emissions of the ferry.</p>
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1990-01-01 - 1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The basis for the data are all Swedish flagged ferries, which are members of the Swedish Shipowners' Association. The <i>quantity value</i> for all parameters is an average of all vessels in the population. The <i>minimum value</i> corresponds to the individual with the lowest energy use and emissions in the population, and the <i>maximum value</i> to the individual with the largest energy use and emissions in the population. The <i>utilisation level</i> with regard to weight is 60%, based on Demker et al. The data is allocated between the passengers and goods, 20 % of the energy use and emissions were allocated to the goods (for further information see Allocations). The energy use and emissions per tonkm for each vessel was calculated (see Specific QMetaData for each flow). For each vessel, the loading capacity was stated in deadweight tonnes (Skeppsregister 1995), installed engine power in kW (Skeppsregister 1995) and speed in knots (Lloyds list). The share of two-stroke and four-stroke engines in each vessel was determined by the size of the vessel according to Alexandersson. All vessels in the population were then used to calculate an average value.</p>
<b>Literature Reference</b>	<p>Alexandersson, A., <i>Sjöfartens utsläpp av avgaser</i>, MariTerm, TFB-rapport 1991:18 Demker, G. et al. <i>Miljöeffekter av transportmedelsval för godstransporter</i>, MariTerm, KFB-rapport, 1994:6 <i>Skeppsregister 1995</i>, Swedish Shipowner Association Sjöbris, A., Flodström, E. <i>Emissions och energivärderingsprinciper för transportsystem</i>, MariTerm, KFB-rapport 1994:9 <i>Lloyds list</i>, 1996</p>
<b>Notes</b>	<p>The energy use and emissions from ferries vary greatly. The result depend on calculation method, size of the ship, speed, route, age of the ship, fuel etc. Swedish Shipowners Association are working on an updated and more detailed version of emission data from ferries.</p>

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography

Sjöbris, A., Flodström, E. *Emissions och energivärderingsprinciper för transportsystem*, MariTerm, KFB-rapport 1994:9  
Notes: The average sulphur content for oil used in international traffic is 3,3 %. (Alexandersson)

## About Inventory

### Publication

*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997*, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997

-----  
Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Elisabeth Sörheim, Swedish Shipowners' Association, contact person for sea transports in the work of NGM  
-----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:

BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

### Detailed Purpose

The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

### Practitioner

Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .

### Reviewer

### Applicability

*The data should be used with great care.* The distribution between goods and passengers may vary to a large extent between different ferries. The choice of allocation will have a large influence on the data. ***The Swedish Shipowners' Association recommends that data for RoRo vessels should be used when considering transport by ferry.***

The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners' Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners' Association.

#### ***Type of vessels***

***Freighters*** - includes all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Freighters are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other

	<p>freighters.  <i>RoRo vessels</i> are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular freighters.  <i>Ferries</i> carry both passengers and goods. The goods are carried in trucks or trains.</p> <p><b>Fuel</b>  The fuel quality may vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use better fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used.</p> <p>Differentiated harbour dues on sulphur and NOx emissions were introduced in Sweden 1 January 1998. This will probably result in use of fuels of a better quality, primarily in ferries but also other freighters.</p> <p><b>Reduction of emissions</b>  The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions.</p> <p><b>Bulky goods</b>  Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m3. The conversion factor is generally accepted in the transportation business.</p> <p><b>Travelled distance</b>  The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done.</p> <p><b>International sea transports</b>  When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.</p>
<b>About Data</b>	<p>The data for emissions is derived from specific emission factors for the engine at a constant 80 % engine load. No test cycle was used to obtain the emission factors. There is however a small need for test cycles, since vessels generally operate at constant load on the engine during the sail. The fact that the engine load sometimes is lower than 80 % i.e. when sailing to and from the harbour has been neglected. This part is generally small but complicated.</p> <p>The calculation model may be used to calculate the energy use and emissions for a specific vessel if the loading capacity, installed engine power etc. is known. This information may be obtained from Skeppsregister. See QMetaData for details.</p>
<b>Notes</b>	<p>The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage:  <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

<i>Date Completed</i>	1997-11-19
<i>Copyright</i>	NGM (Nätverket för Godstransporter och Miljön)
<i>Availability</i>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<i>Name</i>	Ferry, 700-7000 tonnes, future
<i>Functional Unit</i>	1 tonkm, 60 %
<i>Functional Unit Explanation</i>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 60%. An utilisation level of 60% is representative for Swedish domestic traffic if <i>empty trips are included</i> .
<i>Process Type</i>	Unit operation
<i>Site</i>	Sweden
<i>Sector</i>	Sea transport
<i>Owner</i>	Sweden
<i>Technical system description</i>	Operation i.e. propulsion of Swedish flagged ferries carrying both passengers and cargo with new technology reducing the energy use and emissions (catalytic converters, energy saving measures etc.) Only members of the Swedish Shipowners' Association are included. The loading capacity is 700 - 7000 tonnes.

System Boundaries	
<i>Nature Boundary</i>	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2.  Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.
<i>Time Boundary</i>	The data represents new technology, available today but not yet in regular use.
<i>Geographical Boundary</i>	The data is based on Swedish conditions.
<i>Other Boundaries</i>	The average utilisation level is 60% (including empty trips).  <i>Parameters not considered</i> -Driving technique -External conditions e.g. climate etc. -Maintenance level of the vessel  <i>Excluded subsystems</i> -Precombustion, i.e. production and distribution of the fuel. -Maintenance of the vessel (e.g. use of anti fouling) -After-treatment of the vessel -Handling of production rests
<i>Allocations</i>	The energy use and emissions have been allocated between passengers and goods according to a method described in Sjöbris A. Flodström, E. "Emissions och energivärderingsprinciper för transportsystem" KFB rapport 1994:9, 1994  The method is based on the argument that if there were no passengers, the cargo would be transported with a RoRo vessel of the same size. The goods is charged with the amount of energy use and emissions if it had been transported with a RoRo vessel of the same size, and the passengers are charged with the remaining energy use and emissions. The cargo then account for approx. 20% of the total energy use and emissions of the ferry.
<i>Systems Expansions</i>	N/A

Flow Data	
General Activity QMetaData	
<i>Date Conceived</i>	1997-01-01

<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The energy use and emissions was calculated using <i>assumptions</i> on energy saving and emission reducing actions together with data for existing individual vessels with the <i>lowest energy use and emissions</i> within the population of Swedish flagged ferries, which are members of the Swedish Shipowners' Association. The utilisation level with regard to weight is 60 %. The data is allocated between the passengers and goods, 20 % of the energy use and emissions were allocated to the goods (for further information see Allocations). The assumptions were given by the Swedish Shipowners' Association. The data for energy use and emissions for the vessels that was the basis for the calculation, and a description on how the data was obtained, can be found in the activity with ObjectOfStudy.Name: <i>Ferry, 700-7000 tonnes</i> (in this database) or in "Energi- och emissionsuppgifter för godstransporter". The minimum value for the energy use and emissions was used in the calculation. The following percentages for the reduction of energy use and emissions was used in the calculation: -Oil consumption: 30 % (by different energy saving measures) -NOx: 93 % (through optimisation of the engine and catalytic converters) -HC: 88 % (by catalytic converters) -CO: 81 % (by catalytic converters) -Particles: 35 % The sulphur content in the fuel was assumed to be 0,09 %. Emissions of SO2 were calculated from the fuel consumption using the sulphur content in the fuel. Emissions of CO2 were calculated from the fuel consumption using the carbon content in the fuel.
<b>Literature Reference</b>	Energi- och emissionsuppgifter för godstransporter i Sverige, Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning 1997, NGM- Nätverket för Godstransporter och Miljön.
<b>Notes</b>	The energy use and emissions from ferries vary greatly. The result depend on calculation method, size of the ship, speed, route, age of the ship, fuel etc. Swedish Shipowners Association are working on an updated and more detailed version of emission data from ferries.

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Elisabeth Sörheim, Swedish Shipowners' Association, contact person for sea transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

	The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The ambition with the data was to get a picture of future energy use and emissions for Swedish flagged ferries.</p> <p>The data represents new technology (catalytic converters, energy saving measures etc), not yet in regular use. There are at present only a few vessels in Swedish traffic that has installed catalytic converters, since installation of catalytic converters is a large investment for the shipowners.</p>
<b>About Data</b>	The data is based on assumptions on different energy saving and emission reducing actions together with data for existing vessels in Swedish traffic with the lowest energy use and emissions. The data was compiled by the Swedish Shipowners' Association. See Flow QMetadata for further information.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

Technical System	
<b>Name</b>	Fertilizing in silviculture
<b>Functional Unit</b>	ha
<b>Functional Unit Explanation</b>	Per ha fertilized forest land.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Forestry
<b>Owner</b>	Sweden

<b>Technical system description</b>	Fertilizing is in industrial silviculture made 1 -3 times. This step describes one fertilization. The reason is to increase the growth rate during some years. The spreading is performed with tractor (14%) and helicopter (86%). Assumed is that SKOG-CAN 27,2 % N is used (presented as N-fertilizer).
-------------------------------------	---

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Emissions from combustion of fuels are not included.
<b>Time Boundary</b>	The data collected are representative for the time period 1992-1994.
<b>Geographical Boundary</b>	Sweden
<b>Other Boundaries</b>	Production and distribution of fertilizer is not included.

## About Inventory

<b>Publication</b>	Environmental report from Texla Industri AB for 1996, The Environmental Administration in the municipality of Göteborg.  ----- Data documented by: Maria Erixson and Sara Ågren, project employed for the database projet at Technical Environmental Planning, Chalmers University of Technology Documentation reviewed by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology -----
<b>Intended User</b>	To show the environmental load
<b>General Purpose</b>	The purpose of the Environmental report is to be the base for permission trial of activities that is harmful to the environment and further to make shore that the company comply with the decision.
<b>Detailed Purpose</b>	To control that the legislated limits are not exceeded.
<b>Commissioner</b>	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg. .
<b>Practitioner</b>	Bengtsson, Bengt - Texla Industri AB Trankärrsgatan 13 425 37 Hisings-kärä Sweden.
<b>Reviewer</b>	- Swedish government via The Board of County in Göteborg and Bohus or The Environmental Administration in the municipality of Göteborg.
<b>Applicability</b>	The function of the system is not very well described, contact the company for more information.  The raw materials, such as textiles, used in the production is not mentioned.
<b>About Data</b>	No margin of error is found in the report, and one can assume that a lot of values have been rounded. The values often end with zeroes and occasionally are indicated to be an approximation.

Technical System	
<b>Name</b>	Flame retardant polyester (Trevira CS) covering of sofa. ESA-DBP
<b>Functional Unit</b>	"The functional unit was: surface covering of a 3-seat sofa for private use during 10 years." For Trevira CS fabric it is 3.56 kg per sofa.
<b>Functional Unit Explanation</b>	See 'Function'.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	Not applicable

<b>Sector</b>	Consumer goods
<b>Owner</b>	Not applicable
<b>Technical system description</b>	<p>The system is described in "Dahlöf L, 2004, Methodological issues in the LCA procedure for the textile sector - a case study concerning fabrics for a sofa. Environmental Systems Analysis report 2004:7, Chalmers University of Technology, Gothenburg, Sweden": <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004--7.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004--7.pdf</a></p> <p>Other processes in the CPM Database also included in the above publication:  'Cotton (conventional) fibres production. ESA-DBP',  'Cotton covering of sofa. ESA-DBP ' and  'Wool/polyamide covering of sofa. ESA-DBP'.</p> <p>"The function was to provide a surface covering for a sofa.  The color of the fabric was red. Six laundry washings for the Trevira CS fabric were assumed in order to see the relative environmental importance of the cleaning step. It was assumed that the fabric could be readily removed from the sofa. Incineration at disposal of the fabric used was assumed in the base case (the most probable life cycle chains). Heat recovery and emissions from the incineration were taken into account, but possible oil saving or replacement of other waste in the incinerator was only tested in the sensitivity analysis."</p> <p>"Trevira CS is a flame retardant fiber. The flame retardance is obtained through co-polymerization of the monomers with O-Phospholane (Neckelmann 2001). In figure 3 (in the above publication) the different companies and their role in the production of Trevira CS fabric are shown.  The monomers are terephthalic acid and ethylene glycol. The catalyst is antimony trioxide (possibly carcinogenic to humans (Ellebæk Laursen et al 1997)). This polymerisation is, for instance, done by the Trevira group in their factory in Guben, Germany. The Trevira group also has a factory in Portugal. The spun yarn was assumed to be only filament yarn. For fabrics used on sofas, filament yarn is the main type in the case of Trevira CS."</p> <p>In the literature reference following processes are included:</p> <ul style="list-style-type: none"> <li>- Production of Trevira CS filament yarn</li> <li>- Truck from production site of Trevira CS yarn to texturing and dyeing site</li> <li>- Texturing</li> <li>- Dyeing of the yarn</li> <li>- Truck and freighter from yarn texturer and dyer to Swedish weaving mill</li> <li>- Weaving without sizing in Sweden</li> <li>- Business trips from Trevira CS weaving mills site</li> <li>- Truck from weaving mill to wet treatment plant</li> <li>- Thermofix (the fabric is fixated with vapor)</li> <li>- Truck from Swedish wet treatment plant back to weaving mill</li> <li>- Textile distribution at weaving mill in Sweden</li> <li>- Truck from Swedish weaving mill to upholstery plant</li> <li>- Upholstering of Trevira CS fabric on a 3-seat sofa</li> <li>- Laundry of Trevira CS fabric</li> <li>- Truck from user to incineration plant</li> <li>- Incineration of Trevira CS fabric</li> </ul>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	<p>"Mineral resources and water were traced back to their reserves in nature and emissions were followed to air, water or soil.  Below are the exceptions found, when the processes were not traced back to the nature reserves or water, or followed to air, water or ground.</p> <ul style="list-style-type: none"> <li>- A wastewater-treatment plant was included, but the decomposition of each individual chemical was not studied.</li> <li>- The production of the process chemicals and some packaging materials were not within the system boundaries." </li></ul>
<b>Time Boundary</b>	<p>"Data were collected by interviews from 1999 to 2002, but data from reports ranged from 1993 to 1998. Most reports were from 1997."</p>
<b>Geographical Boundary</b>	<p>"Trevira CS:  *production of Trevira CS polymer fibers: Germany  *production of Trevira CS filament yarn and dyeing of the fibers: Denmark  *weaving, finishing, upholstery, use and incineration: Sweden"</p>
<b>Other Boundaries</b>	<p>"The fabrics were assumed to not be worn out before they were disposed of, a realistic scenario for Swedish conditions. Therefore the abrasion resistance was not taken into consideration in the study, while the effect of different lifetimes of the fabrics is discussed in chapter 4.3.7."</p> <p>"Production of Trevira CS filament yarn  The plant has its own wastewater-treatment. The COD reported was assumed to be measured after the wastewater-treatment, therefore the water is assumed to go to water and not the technosphere. The yarn is wound onto a spool. 20-30 kilos are on one spool and the spools are reused (or sent for recycling), therefore they are not reported. General energy use was not reported. The travel at work is not known, but is probably insignificant.</p> <ul style="list-style-type: none"> <li>- Data source: average production data in Europe. The data are a weighted average based on production volumes of 7 different plants in Germany, Austria and the Netherlands (about 30% of total European production). Probably no general energy or water consumption was</li> </ul>

	<p>included. In this LCA study for fabrics, discharges to water were assumed to end up in water.</p> <ul style="list-style-type: none"> <li>- Data includes production of the yarn. There are several types of yarn manufacturing, and filament or staple yarn is the product."</li> </ul> <p>"Texturing The cardboard rolls were assumed to be reused many times, and they were therefore left out. 20-30 kg yarn is wound onto a spool."</p> <p>"Truck and freighter from yarn texturer and dyer to Swedish weaving mill The distance by boat was assumed to 40 km and by truck to 300 km. The freighter was assumed to medium size (2000-8000 dead weight tons), Load factor: 60%."</p> <p>"Business trips from Trevira CS weaving mills site The travel distance was calculated to 0.93 vkm/kg fabric."</p> <p>"Truck from weaving mill to wet treatment plant The distance was assumed to 30 km."</p> <p>"Thermofix (the fabric is fixated with vapor) - Data were estimated from one wet treatment plant, and literature values for a comparison are found below. The plant uses light fuel oil and water to generate steam. Unfortunately, only total water and energy use was known and the plant has many different activities. The calculation based on weight gave the value 23 MJ for use of light fuel oil, which is much higher than the literature data. Another plant uses LPG, but that plant had no data about gas and water consumption. One plant uses industrial water and the other uses water from a well. - According to Ellebæk Laursen et al (1997) finishing (a process where properties of the fabric are changed, often with chemicals) uses 4.05-8.00 MJ/kg fabrics. Dyeing, washing and drying uses 3.40-13.2 MJ/kg. Therefore, the estimated 8 MJ/kg seems realistic. The water consumption in the inventory was estimated from the plant. - Amount of cardboard is for the rolls and comes from one wet treatment mill."</p> <p>"Truck from Swedish wet treatment plant back to weaving mill The distance was assumed to 30 km."</p> <p>"Truck from Swedish weaving mill to upholstery plant The distance was assumed to 500 km."</p> <p>"Laundry of Trevira CS fabric The difference as compared laundering of cotton is that the load factor in the washing machine was assumed to 2/3 according to instructions from Electrolux (1996). Tumble-drying was assumed to be one third of the time for cotton tumble-drying."</p> <p>"Truck from user to incineration plant The distance to the incineration plant was assumed to 25 km."</p>
<b>Allocations</b>	<p>"The allocation procedure by mass was not uniform in applications. The deviations were as follows:</p> <ul style="list-style-type: none"> <li>- No flows were allocated to waste, such as edge strips from weaving or cardboard or textile samples.</li> <li>- In the weaving operation, allocation was made per meter fabric.</li> <li>- Allocations for light fuel oil, heavy fuel oil, LPG and natural gas production were not known as well as for electricity from natural gas or oil and production of sodium hydroxide and ethylene glycol used for the sensitivity analysis.</li> <li>- For electricity production (Swedish average) the allocation between recycling and virgin materials was according to the 50/50 method. When heat was also produced, the allocation was according to energy output.</li> <li>- For electricity (European average), exergy values were used to allocate between electricity and heat."</li> </ul>
<b>Systems Expansions</b>	Not applicable.

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	Unknown
<b>Data Type</b>	Calculated
<b>Represents</b>	See 'Function'.
<b>Method</b>	The data is produced with the software tool LCAit.

About Inventory	
<b>Publication</b>	Dahllöf L, 2004, Methodological issues in the LCA procedure for the textile sector - a case study concerning fabrics for a sofa. Environmental Systems Analysis report 2004:7, Chalmers University of Technology, Gothenburg, Sweden  <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004-7.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2004-7.pdf</a>
<b>Intended User</b>	LCA and textile practitioner
<b>General Purpose</b>	Part of doctoral studies. "The overall purpose of the studies is to give suggestions for solving some of the methodological issues within the LCA method when used in the field of textiles."
<b>Detailed Purpose</b>	"The goal of this case study was to identify, map and discuss LCA methodological issues in the textile sector. This was done by carrying out an LCA study with the goal of ranking three fabric types for a sofa. i) The main reason for carrying out the study was that the LCA methodology is not fully developed and different sectors have different method development needs. This work was being done on the basis of interest from the textile industry in Sweden. ii) The study could be used for further development regarding methodological issues in the efforts to establish Product Specific Rules (PSRs) for Certified Environmental Declarations (EPDs) in the textile sector (the Swedish Environmental Management Council 2000) and for the modification work of the ISO 14040 (1997) - ISO 14043 (2000) standards. iii) It is intended to be used by purchasers, designers, etc., in the textile industry as well as for researchers and others working with the ISO 14040 (1997) - ISO 14043 (2000) standards."
<b>Commissioner</b>	Stiftelsen Svensk Textilforskning - .
<b>Practitioner</b>	Lisbeth Dahllöf - .
<b>Reviewer</b>	Maria Walenius Henriksson - IFP Research AB
<b>Applicability</b>	For applicability for the process see 'Technical System' and 'System Boundaries' above.
<b>About Data</b>	ESA Database Project. Years: 2009-2011. Administering organisation: Chalmers University of Technology, the department of Environmental Systems Analysis. Financier: The Swedish Research Council. Importer of data: Filippa Fuhrman (ESA), assisted by Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
<b>Notes</b>	The original publication includes more information about data.  "The studies are being carried out at the Environmental Systems Analysis Department at Chalmers University of Technology in Gothenburg, Sweden and are being financed mainly by Stiftelsen Svensk Textilforskning and CPM, Centre for Environmental Assessment of Product and Material Systems."

## SPINE LCI dataset: Flexible PUR foam

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996
<b>Copyright</b>	
<b>Availability</b>	
Technical System	

<b>Name</b>	Flexible PUR foam
<b>Functional Unit</b>	1 kg of flexible PUR foam
<b>Functional Unit Explanation</b>	
<b>Process Type</b>	Gate to gate
<b>Site</b>	
<b>Sector</b>	Materials and components
<b>Owner</b>	
<b>Technical system description</b>	This set of data does not concern the production of the polyurethane precursors (TDI, MDI, Polyols) but the production of one particular type of polyurethane foam. In fact, polyurethane foam can be rigid, flexible, etc. and then one can find different recipes for it (different mixing of the precursors). In fact, here is the recipe of the FLEXIBLE POLYURETHANE FOAM.

About Inventory	
<b>Publication</b>	Blanco-Rosete S. R., 2002, LCA data structure and time series related to construction and maintenance in Sweden. Environmental Systems Analysis report 2002: 14, Chalmers University of Technology, Gothenburg, Sweden
<b>Intended User</b>	LCA practitioners.
<b>General Purpose</b>	This process data set is recalculated to fit in the Master Thesis given in 'Publication'. Excerpt from the report (see 'Publication'): "Construction, building maintenance and housing management contribute to a large extent to the environmental impact. When housing owners and managers perform their activities they should be aware of the environmental effects they cause. The environmental impact of existing houses could be addressed and diminished within the possibilities of a clever management."
<b>Detailed Purpose</b>	Excerpt from the report (see 'Publication'): "This master thesis describes and defines a building system model for a multi-family house in Gothenburg over a 30 year period from 1970 to 2002. The model was used to collect environmental impact information regarding materials or products used in the construction and maintenance of a building. The environmental impact of a multi-family house was evaluated through a Life Cycle Assessment (LCA). Finally to account the long service lifetime of a multi-family house two case studies were carried out to test if the use of Time series can illustrate the environmental impact of maintenance activities caused by decisionmaking in housing management."
<b>Commissioner</b>	Not applicable - .
<b>Practitioner</b>	Sergio R. Blanco-Rosete - .
<b>Reviewer</b>	Birgit Brunklaus - Environmental Systems Analysis
<b>Applicability</b>	For applicability for the process see 'Technical System' and 'System Boundaries'.
<b>About Data</b>	Excerpt from the report (see 'Publication'): "Data for the maintenance of linoleum is taken from one of the described scenarios in "Life cycle assessment for building products. The significance of the usage phase." (Paulsen ,1999). In that study tables for emissions are presented as factors in order to estimate the impact produced according to the area, time and frequency the maintenance is taking place."  ESA Database Project. Years: 2009-2011. Documentation completed for this data set: 2010-09-21 Administering organisation: Chalmers University of Technology, the division of Environmental Systems Analysis. Financier: The Swedish Research Council. Documentor of data: Filippa Fuhrman (ESA). Review committee for documented data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).

SPINE LCI dataset: Forging of ingot into steel bars, 350 mm

Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Forging of ingot into steel bars, 350 mm
<b>Functional Unit</b>	One ton of forged steel bars, 350 mm
<b>Functional Unit Explanation</b>	The forged steel bars will serve as raw material for the ring production at the ring mill at Ovako Steel AB in Hofors. The rings will later be processed into bearing rings at SKF's site in Göteborg and finally mounted into the SKF spherical roller bearing 232/530.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Scana Steel Söderfors ABBox 104 815 04 SÖDERFORS
<b>Sector</b>	Materials and components
<b>Owner</b>	Scana Steel Söderfors ABBox 104 815 04 SÖDERFORS
<b>Technical system description</b>	<p>This activity is a process step in the system "Production of bearing rings", this activity is available in the SPINE@CPM database.</p> <p>When producing the bearing rings the heated steel ingot needs to be forged into steel bars. This dataset represents environmental impact from this activity.</p> <p>The ingot is cold when the process starts at the forge at Scana Steel AB in Söderfors. As a first step the ingot is heated in an oven. The first part of the oven heats the ingot from room temperature to 180°C immediately. The ingot is then transported through different temperature areas and is slowly heated until it reaches 1150°C. This heating process takes approximately 1-2 days.</p> <p>The next process step is pressing in the forging press. The heated ingot is put in the press and edged into round shape. Finally the now nearly round bars are pressed complete round while rotating against a round swage in form of two half circles. The forging is completed and the forged bars are inspected and cooled in room temperature for approximately one day.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Emissions to water are not known.</p> <p>Emissions to air are included. The emissions to air refer mostly to the combustion of the heavy fuel oil, taking place in the forge oven.</p>
<b>Time Boundary</b>	All data refers to year 2001. No changes are planned for the nearest future.
<b>Geographical Boundary</b>	The forging mill is located at Scana Steel Söderfors AB in Söderfors, Sweden.
<b>Other Boundaries</b>	<p>No internal transport is included.</p> <p>The production of heavy fuel oil and electricity is NOT included in this dataset, but must be followed from the grave to obtain the total environmental impact.</p>
<b>Allocations</b>	Allocation have been made according to weight.
<b>Systems Expansions</b>	Not applicable

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	02-08-01 - 02-12-31
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	See 'Function'.
<b>Method</b>	The data has been gathered from interviews with Leif Hedström at Scana Steel Söderfors AB in Söderfors. He picked data from Scana's environmental report from year 2001. Some data has been estimated by Leif Hedström. According to Leif, 15017 ton forged material was produced during year 2001. This is approximately 2/3 of all material totally produced at Scana Steel AB in Söderfors 2001. 2/3 of the emissions and the electricity and oil consumption in the environmental report for year 2001, was allocated to the forged material. Consumption of grease and lubricating oil is allocated to the forged material 100%, according to Leif Hedström.

## SPINE LCI dataset: Forwarding of harvested wood

Administrative	
<b>Finished</b>	Y

<b>Date Completed</b>	1998-02-13
<b>Copyright</b>	None
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Forwarding of harvested wood
<b>Functional Unit</b>	m3sub
<b>Functional Unit Explanation</b>	Per m3sub softwood transported from the felling site to the roadside.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Middle Sweden
<b>Sector</b>	Forestry
<b>Owner</b>	Middle Sweden
<b>Technical system description</b>	Forwarding is the transport of any felled wood (from thinning or final felling) from the felling area to the road side. This activity is succeeded by a transport of the wood to a sawmill or a pulp mill. These transports vary from case to case and are therefore not included in this line of operations.

System Boundaries	
<b>Nature Boundary</b>	Emissions caused by combustion of fuels is not included.
<b>Time Boundary</b>	The data collected are representative for the time period 1992-1994.
<b>Geographical Boundary</b>	Central Sweden
<b>Other Boundaries</b>	N/A
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Technical System	
<b>Name</b>	Fossil diesel - EN590 combustion in heavy duty truck or bus, Euro V, tank-to-wheel, f3 fuels
<b>Functional Unit</b>	1 MJ
<b>Functional Unit Explanation</b>	1 MJ input of fossil diesel EN590 to vehicle tank

<b>Process Type</b>	Gate to grave
<b>Site</b>	
<b>Sector</b>	Fuel
<b>Owner</b>	
<b>Technical system description</b>	<p>The data represent emissions from fossil diesel - EN590 combustion in heavy duty truck or bus, Euro V, tank-to-wheel.</p> <p>The emission legislation uses the definition of a heavy duty vehicle having a gross weight of 3.5 tons or more.</p> <p>The reported emission factors should be considered as generic data, and it should be noted that the emissions for a specific vehicle and a specific mission might differ from those generic data. For example, the limit values for certification of engines have been used as basis for deriving some of the emission factors. The duty cycles used for certification are defined to cover the whole range of typical loads of an engine in different operations. The operation of a specific vehicle can however differ from the duty cycle used in the certification, resulting in different emissions than calculated with the generic emission factors. E.g. for the regulated emissions: nitrous oxides, particles, total organic compounds and carbon monoxide, the values are conservative based on the maximum emissions limits per kWh of engine output when driving at the best point (the optimal engine speed/torque operating point). In reality, the values are often lower.</p>

<b>System Boundaries</b>

SPINE LCI dataset: Fossil diesel - MK1 combustion in heavy duty truck or bus, Euro V, tank-to-wheel, f3 fuels

## Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	2013-11-30
<b>Copyright</b>	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
<b>Availability</b>	Public

## Technical System

<b>Name</b>	Fossil diesel - MK1 combustion in heavy duty truck or bus, Euro V, tank-to-wheel, f3 fuels
<b>Functional Unit</b>	1 MJ
<b>Functional Unit Explanation</b>	1 MJ input of fossil diesel MK1 to vehicle tank
<b>Process Type</b>	Gate to grave
<b>Site</b>	
<b>Sector</b>	Fuel
<b>Owner</b>	
<b>Technical system description</b>	<p>The data represent emissions from fossil diesel - MK1 combustion in heavy duty truck or bus, Euro V, tank-to-wheel.</p> <p>The emission legislation uses the definition of a heavy duty vehicle having a gross weight of 3.5 tons or more.</p> <p>The reported emission factors should be considered as generic data, and it should be noted that the emissions for a specific vehicle and a specific mission might differ from those generic data. For example, the limit values for certification of engines have been used as basis for deriving some of the emission factors. The duty cycles used for certification are defined to cover the whole range of typical loads of an engine in different operations. The operation of a specific vehicle can however differ from the duty cycle used in the</p>

	certification, resulting in different emissions than calculated with the generic emission factors. E.g. for the regulated emissions: nitrous oxides, particles, total organic compounds and carbon monoxide, the values are conservative based on the maximum emissions limits per kWh of engine output when driving at the best point (the optimal engine speed/torque operating point). In reality, the values are often lower.

<b>Represents</b>	See 'Function'.
<b>Method</b>	The emission factors (EF, kg/MJ) for the regulated emissions have been estimated based on ETC (transient test cycle for truck and bus engines), legislation limits for Euro V (2005/55/EC). The ETC cycle is for heavy duty engines and vehicle ( <a href="http://www.dieselnet.com">www.dieselnet.com</a> ). Equation for calculation of emission factors for fuel use: Efficiency: 0.44 (?) = (energy work/energy in fuel) which is the efficiency at the best point (the optimal engine speed/torque operating point) and which gives the maximum emission factors within the legislation limit. EF fuel use (g/MJ) = EF work (g/kWh)/3.6*? Emissions of CO2 and SO2 have been calculated based on carbon- and sulphur content in the fuel, see documentation "Data compilation method for a specific flow" and "Reference" in the Flow table. Emissions of CH4 was calculated from JRC (2013) and N2O was best estimate.

## SPINE LCI dataset: France, electricity generation mix 1998

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	2001-01-31
<b>Copyright</b>	IEA
<b>Availability</b>	Public

<b>Technical System</b>	
<b>Name</b>	France, electricity generation mix 1998
<b>Functional Unit</b>	Total electricity produced during 1998
<b>Functional Unit Explanation</b>	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
<b>Process Type</b>	Unit operation
<b>Site</b>	France
<b>Sector</b>	Energyware
<b>Owner</b>	France
<b>Technical system description</b>	The generation of electricity with different power generating systems in France during the year 1998. France includes Monaco, and excludes overseas departments (Martinique, Guadeloupe, French Polynesia and Réunion).

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
<b>Time Boundary</b>	The data refer to 1998.
<b>Geographical Boundary</b>	Only electricity produced in Australia is considered. Import or export of electricity is not included.
<b>Other Boundaries</b>	-
<b>Allocations</b>	Not applicable
<b>Systems Expansions</b>	Not applicable

<b>Flow Data</b>

### About Inventory

<b>Publication</b>	<p>IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8.</p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden</p> <p>-----</p>
<b>Intended User</b>	LCA practitioners
<b>General Purpose</b>	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
<b>Detailed Purpose</b>	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyvningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.
<b>Commissioner</b>	Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .
<b>Practitioner</b>	Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .
<b>Reviewer</b>	CPM -
<b>Applicability</b>	<p>The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in "Represents" in QMetaData for each specific flow.</p> <p>When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations:</p> <ul style="list-style-type: none"> <li>- Biofuel electricity energy system, EPD-version</li> <li>- Fuel gas electricity energy system, EPD-version</li> <li>- Hydro electricity energy system, EPD-version</li> </ul>

## SPINE LCI dataset: Freight plane, MD-82

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Freight plane, MD-82
<b>Functional Unit</b>	1 tonkm, 300 km, 65%
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 km calculated for 300 km flight distance and an average utilisation level equivalent to 65 % passenger occupation (9 450 kg)
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden

<b>Sector</b>	Air transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of MD-82 aircraft, only carrying cargo. The operation includes take-off, climb, cruise, descent and landing (including operations on the ground).</p> <p><i>Technical data for the aircraft:</i>  Maximum take-off weight 67,8 tonnes.  Maximum payload (i.e. maximum loading capacity with regard to weight) 17100 tonnes.  Max cruising altitude 11,300 metres  Cruising speed 815-825 km/h  Length: 45.1 m  Wing span: 32.9 m  Range: 3,200 km  Engine: P&amp;W JT8D-217C/-219</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:  -regulated emissions for diesel engines: NOx, HC, particles and CO  -fuel regulated: SO2  -tax regulated CO2.</p> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents aircraft in use in 1997
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The data is only valid for a flight distance of 300 km, and an average utilisation equivalent to 65 % passenger occupation (9 450 kg). The maximum value is equivalent to 49 % (6 450 kg) and the minimum value is equivalent to 86 % passenger occupation (12 450 kg).</p> <p><i>Parameters not considered</i>  -External conditions i.e. climate etc  -Maintenance level of the aircraft.</p> <p><i>Excluded subsystems</i>  -Precombustion, i.e. production and distribution of the fuel  -Maintenance of the aircraft  -After-treatment of the aircraft  -Handling of production rests</p>
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Modeled data
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The energy use and emissions per tonkm was obtained by simulation calculations performed by FFA (The Aeronautical Research Institute of Sweden) for a flight distance of 300 km. The <i>quantity value</i> is equivalent to a passenger occupation of 65% (9450 kg), the <i>minimum value</i> corresponds to a passenger occupation of 81 % (12450 kg) and the <i>maximum value</i> of 49 % (6450 kg). The simulation calculations is performed in two steps. To obtain the fuel consumption, the flight path for each section is simulated, where both load and flight distance is accounted for. The position of the aircraft and the operation conditions of the engine are established for every second of the flight. This data is used in a new simulation where the exhaust emissions are calculated with regard to engine speed and flying altitude for every moment of the flight. The result from the simulation is then used to calculate the energy use and emissions per tonkm. The data include landing and take off, i.e. flight operations below 3000 feet (including operation of the ground) <i>Data used for the fuel:</i> -Thermal value: 43,2 MJ/kg -Sulphur content: 500 ppm</p>
<b>Literature Reference</b>	Larsson, Lars Gunnar, Calculations performed at FFA for NGM, 1997, Not published
<b>Notes</b>	<p>The data is only valid for a flight distance of 300 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.</p>

## Flow Table and Specific Meta Data

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere

## About Inventory

### Publication

*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997*

-----  
Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology  
-----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:

BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

### Detailed Purpose

The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

### Practitioner

Larson, Lars-Gunnar - FFA (Flygtekniska försöksanstalten), Box 11021 S-161 11 Bromma Sweden.

### Reviewer

### Applicability

The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the plane, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

Goods transportation by air transport is done either in special freight planes or in regular passenger flights together with passengers. Air transport is primarily used for transportation of valuable or fragile goods and for speedy deliveries. Air transport is also more expensive than other modes of transportation. Consequently, very little goods are transported by aircraft. The major part of the goods is transported in regular passenger planes. The amount of goods that can be carried in passenger aircraft is however small. The average load of goods in a passenger aircraft is below 100 kg and is equivalent to an average passenger with average luggage. The passenger occupation will therefore have a large influence on the energy use and the emissions for goods carried in regular passenger aircraft.

The MD-82 was chosen to represent Swedish air transport since it is one of the most common used aircraft in domestic regular traffic in Sweden. The aircraft represents an average regarding both technical standard and emissions. The aircraft has a long average lifetime.

#### Utilisation level and distance

For air transports, data on energy use and emissions per tonkm may only be given for a specific flight distance since the energy use and emissions vary substantially during the

	<p>different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights longer than 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance. Consequently, the longer the flight the more energy efficient transport. Aircraft are optimised for energy efficiency during the cruise phase.</p> <p>The average distance for Swedish domestic flights is between 300 and 600 km. Data for freight planes was therefore both given for a flight distance of 300 km and 600 km. The average utilisation was assumed to be equivalent to a passenger occupation of 65 %, which may be a conservative assumption compared to actual operation. To obtain a minimum and a maximum value for the energy use and emissions, data was also given for a higher utilisation (81 %, the minimum value in the data) and a lower utilisation (49 %, the maximum value).</p> <p>To calculate energy use and emissions for other flight distances, the following relations may be used, where x=total distance in km. These relations are valid for flights longer than 300 km and concern a MD-82 loaded with 9450 kg i.e. a utilisation level equivalent to a passenger occupation of 65%.</p> <p>-Kerosene: <math>2220 + 3,1 \cdot (x-300)</math> [kg]          -CO<sub>2</sub>: <math>7015 + 9,8 \cdot (x-300)</math> [kg]          -CO: <math>9,6 + 0,0129 \cdot (x-300)</math> [kg]          -HC: <math>1,848 + 0,0049 \cdot (x-300)</math> [kg]          -NO<sub>x</sub>: <math>29,85 + 0,031 \cdot (x-300)</math> [kg]          -SO<sub>2</sub>: <math>2,22 + 0,003 \cdot (x-300)</math> [kg]</p>
<b>About Data</b>	The data is based on simulation calculations performed at FFA (The Aeronautical Research Institute of Sweden).
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

Technical System	
<b>Name</b>	Freight plane, MD-82
<b>Functional Unit</b>	1 tonkm, 600 km, 65%
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for a flight distance of 600 km and an average utilisation level equivalent to 65 % passenger occupation (9 450 kg). .
<b>Process Type</b>	Unit operation

<b>Site</b>	Sweden
<b>Sector</b>	Air transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of MD-82 aircraft, only carrying cargo. The operation includes take-off, climb, cruise, descent and landing (including operations on the ground).</p> <p><i>Technical data for the aircraft:</i>  Maximum take-off weight 67,8 tonnes.  Maximum payload (i.e. maximum loading capacity with regard to weight) 17100 tonnes.  Max cruising altitude 11,300 metres  Cruising speed 815-825 km/h  Length: 45.1 m  Wing span: 32.9 m  Range: 3,200 km  Engine: P&amp;W JT8D-217C/-219</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are  -regulated emissions for diesel engines: NOx, HC, particles and CO  -fuel regulated: SO2  -tax regulated CO2.</p> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental impacts have not been considered.</p>
<b>Time Boundary</b>	The data represents aircraft in use in 1997
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The flight distance is 600 km. The quantity value is equivalent to 65 % passenger occupation (9 450 kg). The maximum value is equivalent to 49 % (6 450 kg) and the minimum value is equivalent to 86 % passenger occupation (12 450 kg).</p> <p><i>Parameters not considered</i>  External conditions i.e. climate etc  Maintenance level of the aircraft.</p> <p><i>Excluded subsystems</i>  Precombustion, i.e. production and distribution of the fuel  Maintenance of the aircraft  After-treatment of the aircraft  Handling of production rests</p>
<b>Allocations</b>	N/A

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Modeled data
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The energy use and emissions per tonkm was obtained by simulation calculations performed by FFA (The Aeronautical Research Institute of Sweden) for a flight distance of 600 km. The <i>quantity value</i> is equivalent to a passenger occupation of 65% (9450 kg), the <i>minimum value</i> corresponds to a passenger occupation of 81 % (12450 kg) and the <i>maximum value</i> of 49 % (6450 kg). The simulation calculations is performed in two steps. To obtain the fuel consumption, the flight path for each section is simulated, where both load and flight distance is accounted for. The position of the aircraft and the operation conditions of the engine are established for every second of the flight. This data is used in a new simulation where the exhaust emissions are calculated with regard to engine speed and flying altitude for every moment of the flight. The result from the simulation is then used to calculate the energy use and emissions per tonkm. The data include landing and take off, i.e. flight operations below 3000 feet (including operation of the ground) <i>Data used for the fuel:</i> -Thermal value: 43,2 MJ/kg -Sulphur content: 500 ppm</p>
<b>Literature Reference</b>	Lars-Gunnar Larson, Calculations performed at FFA (Flygtekniska försöksanstalten) for NGM, 1997, Not published
<b>Notes</b>	<p>The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight</p>

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1990-01-01 - 1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The basis for the data are all Swedish flagged freighters between 2000 and 8000 deadweight tonnes, which are members of the Swedish Shipowners' Association. The <i>quantity value</i> for all parameters is an average of all vessels in the population. The <i>minimum value</i> corresponds to the individual with the lowest energy use and emissions in the population, and the <i>maximum value</i> to the individual with the largest energy use and emissions in the population. The <i>utilisation level</i> with regard to weight is 50 % for tankers and 60 % for other freighters, based on Demker et al. The energy use and emissions per tonkm for each vessel was calculated (see Specific QMetaData for each flow). For each vessel, the loading capacity was stated in deadweight tonnes (Skeppsregister 1995), installed engine power in kW (Skeppsregister 1995) and speed in knots (Lloyds list). The share of two-stroke and four-stroke engines in each vessel was determined by the size of the vessel according to Alexandersson. All vessels in the population were then used to calculate an average value.</p>
<b>Literature Reference</b>	<p>Alexandersson, A., <i>Sjöfartens utsläpp av avgaser</i>, MariTerm, TFB-rapport 1991:18 Demker, G. et al. <i>Miljöeffekter av transportmedelsval för godstransporter</i>, MariTerm, KFB-rapport, 1994:6 <i>Skeppsregister 1995</i>, Swedish Shipowner Association Sjöbris, A., Flodström, E. <i>Emissions och energivärderingsprinciper för transportsystem</i>, MariTerm, KFB-rapport</p>

	1994:9 <i>Lloyds list</i> , 1996
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

	<p>Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners' Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners' Association.</p> <p><b>Type of vessels</b>  <i>Freighters</i> - includes all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Freighters are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other freighters.  <i>RoRo vessels</i> are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular freighters.  <i>Ferries</i> carry both passengers and goods. The goods are carried in trucks or trains.</p> <p><b>Fuel</b>  The fuel quality may vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use better fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used.</p> <p>Differentiated harbour dues on sulphur and NOx emissions were introduced in Sweden 1 January 1998. This will probably result in use of fuels of a better quality, primarily in ferries but also other freighters.</p> <p><b>Reduction of emissions</b>  The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions.</p> <p><b>Bulky goods</b>  Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Travelled distance</b>  The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done.</p> <p><b>International sea transports</b>  When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.</p>
<p><b>About Data</b></p>	<p>The data for emissions is derived from specific emission factors for the engine at a constant 80 % engine load. No test cycle was used to obtain the emission factors. There is however a small need for test cycles, since vessels generally operate at constant load on the engine during the sail. The fact that the engine load sometimes is lower than 80 % i.e. when sailing to and from the harbour has been neglected. This part is generally small but complicated.</p> <p>The calculation model may be used to calculate the energy use and emissions for a specific vessel if the loading capacity, installed engine power etc. is known. This information may be obtained from Skeppsregister. See QMetaData for details.</p>
<p><b>Notes</b></p>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different</p>

transportation alternatives.

The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

## SPINE LCI dataset: Freighter, 2000-8000 dwt, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Freighter, 2000-8000 dwt, future
<b>Functional Unit</b>	1 tonkm, 50-60 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 50 % for tankers and 60% for other freighters. An utilisation level of 50 % for tankers and 60% for other freighters is representative for Swedish domestic traffic if <i>empty trips are included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Sea transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation i.e. propulsion of Swedish flagged freighters between 2000 - 8000 dwt (deadweight tonnes) with new technology reducing the energy use and emissions (catalytic converters, energy saving measures etc.). Only members of the Swedish Shipowners' Association are included.</p> <p>Freighters include all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NO<sub>x</sub>, HC, particles and CO</li> <li>-fuel regulated: SO<sub>2</sub></li> <li>-tax regulated CO<sub>2</sub>.</li> </ul> <p>Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents new technology, available today but not yet in use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 50 % for tankers and 60% for other freighters 60% (including empty trips)</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions e.g. climate etc.</li> <li>-Maintenance level of the vessel</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Precombustion, i.e. production and distribution of the fuel.</li> <li>-Maintenance of the vessel (e.g. use of anti fouling)</li> <li>-After-treatment of the vessel</li> </ul>

<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	The energy use and emissions was calculated using <i>assumptions</i> on energy saving and emission reducing actions together with data for existing individual vessels with the <i>lowest energy use and emissions</i> within the population of Swedish flagged Freighters between 8000 an 2000 dwt, which are members of the Swedish Shipowners' Association vessels. The utilisation level with regard to weight is 50 % for tankers and 60% for other freighters. The assumptions were given by the Swedish Shipowners' Association. The data for energy use and emissions for the vessels that was the basis for the calculation, and a description on how the data was obtained, can be found in the activity with ObjectOfStudy.Name: <i>Freighter, 8000-2000 dwt</i> (in this database) or in "Energi- och emissionsuppgifter för godstransporter". The minimum value for the energy use and emissions was used in the calculation. The following percentages for the reduction of energy use and emissions was used in the calculation: -Oil consumption: 30 % (by different energy saving measures) -NOx: 93 % (through optimisation of the engine and catalytic converters) -HC: 88 % (by catalytic converters) -CO: 81 % (by catalytic converters) -Particles: 35 % The sulphur content in the fuel was assumed to be 0,09 %. Emissions of SO2 were calculated from the fuel consumption using the sulphur content in the fuel. Emissions of CO2 were calculated from the fuel consumption using the carbon content in the fuel.
<b>Literature Reference</b>	Energi- och emissionsuppgifter för godstransporter i Sverige, Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning 1997, NGM- Nätverket för Godstransporter och Miljön.
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1990-01-01 - 1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The basis for the data are all Swedish flagged freighters larger than 8000 deadweight tonnes, which are members of the Swedish Shipowners' Association. The <i>quantity value</i> for all parameters is an average of all vessels in the population. The <i>minimum value</i> corresponds to the individual with the lowest energy use and emissions in the population, and the <i>maximum value</i> to the individual with the largest energy use and emissions in the population. The <i>utilisation level</i> with regard to weight is 50 % for tankers and 60% for other freighters, based on Demker et al. The energy use and emissions per tonkm for each vessel was calculated (see Specific QMetaData for each flow). For each vessel, the loading capacity was stated in deadweight tonnes (Skeppsregister 1995), installed engine power in kW (Skeppsregister 1995) and speed in knots (Lloyds list). The share of two-stroke and four-stroke engines in each vessel was determined by the size of the vessel according to Alexandersson. All vessels in the population were then used to calculate an average value.</p>

<b>Literature Reference</b>	Alexandersson, A., <i>Sjöfartens utsläpp av avgaser</i> , MariTerm, TFB-rapport 1991:18 Demker, G. et al. <i>Miljöeffekter av transportmedelsval för godstransporter</i> , MariTerm, KFB-rapport, 1994:6 <i>Skeppsregister 1995</i> , Swedish Shipowner Association Sjöbris, A., Flodström, E. <i>Emissions och energivärderingsprinciper för transportsystem</i> , MariTerm, KFB-rapport 1994:9 <i>Lloyds list</i> , 1996
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

Data for Swedish flagged vessels that are members of the Swedish Shipowners' Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners' Association.</p> <p><b>Type of vessels</b>  <i>Freighters</i> - includes all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Freighters are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other freighters.  <i>RoRo vessels</i> are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular freighters.  <i>Ferries</i> carry both passengers and goods. The goods are carried in trucks or trains.</p> <p><b>Fuel</b>  The fuel quality may vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use better fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used.</p> <p>Differentiated harbour dues on sulphur and NOx emissions were introduced in Sweden 1 January 1998. This will probably result in use of fuels of a better quality, primarily in ferries but also other freighters.</p> <p><b>Reduction of emissions</b>  The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions.</p> <p><b>Bulky goods</b>  Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Travelled distance</b>  The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done.</p> <p><b>International sea transports</b>  When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.</p>
<b>About Data</b>	<p>The data for emissions is derived from specific emission factors for the engine at a constant 80 % engine load. No test cycle was used to obtain the emission factors. There is however a small need for test cycles, since vessels generally operate at constant load on the engine during the sail. The fact that the engine load sometimes is lower than 80 % i.e. when sailing to and from the harbour has been neglected. This part is generally small but complicated.</p> <p>The calculation model may be used to calculate the energy use and emissions for a specific vessel if the loading capacity, installed engine power etc. is known. This information may be obtained from Skeppsregister. See QMetaData for details.</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriförbundet, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at</p>

	<p>the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

SPINE Data Report © SLC, Chalmers University of Technology, 2020 SLC - the Swedish life cycle center

## SPINE LCI dataset: Freightier, larger than 8000 dwt, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Freightier, larger than 8000 dwt, future
<b>Functional Unit</b>	1 tonkm, 50-60 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 50 % for tankers and 60% for other freighters. An utilisation level of 50 % for tankers and 60% for other freighters is representative for Swedish domestic traffic if <i>empty trips are included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Sea transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation i.e. propulsion of Swedish flagged freighters larger than 8000 dwt (deadweight tonnes) with new technology reducing the energy use and emissions (catalytic converters, energy saving measures etc.). Only members of the Swedish Shipowners' Association are included.</p> <p>Freighters include all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents new technology, available today but not yet in use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 50 % for tankers and 60% for other freighters 60% (including empty trips)</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions e.g. climate etc.</li> <li>-Maintenance level of the vessel</li> </ul>

	<i>Excluded subsystems</i> -Precombustion, i.e. production and distribution of the fuel. -Maintenance of the vessel (e.g. use of anti fouling) -After-treatment of the vessel -Handling of production rests
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The energy use and emissions was calculated using <i>assumptions</i> on energy saving and emission reducing actions together with data for existing individual vessels with the <i>lowest energy use and emissions</i> within the population of Swedish flagged freighters larger than 8000 dwt, which are members of the Swedish Shipowners' Association vessels. The utilisation level with regard to weight is 50 % for tankers and 60% for other freighters. The assumptions were given by the Swedish Shipowners' Association. The data for energy use and emissions for the vessels that was the basis for the calculation, and a description on how the data was obtained, can be found in the activity with ObjectOfStudy.Name: <i>Freighter, larger than 8000 dwt</i> (in this database) or in "Energi- och emissionsuppgifter för godstransporter". The minimum value for the energy use and emissions was used in the calculation. The following percentages for the reduction of energy use and emissions was used in the calculation: -Oil consumption: 30 % (by different energy saving measures) -NOx: 93 % (through optimisation of the engine and catalytic converters) -HC: 88 % (by catalytic converters) -CO: 81 % (by catalytic converters) -Particles: 35 % The sulphur content in the fuel was assumed to be 0,09 %. Emissions of SO2 were calculated from the fuel consumption using the sulphur content in the fuel. Emissions of CO2 were calculated from the fuel consumption using the carbon content in the fuel.</p>
<b>Literature Reference</b>	Energi- och emissionsuppgifter för godstransporter i Sverige, Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning 1997, NGM- Nätverket för Godstransporter och Miljön.
<b>Notes</b>	<p>The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.</p>

<b>Flow Table and Specific Meta Data</b>

<b>About Inventory</b>	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Elisabeth Sörheim, Swedish Shipowners' Association, contact person for sea transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods

<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1990-01-01 - 1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	The basis for the data are all Swedish flagged freighters smaller than 2000 deadweight tonnes (and larger than 300 BRT), which are members of the Swedish Shipowners' Association. The <i>quantity value</i> for all parameters is an average of all vessels in the population. The <i>minimum value</i> corresponds to the individual with the lowest energy use and emissions in the population, and the <i>maximum value</i> to the individual with the largest energy use and emissions in the population. The <i>utilisation level</i> with regard to weight is 50 % for tankers and 60% for other freighters, based on Demker et al. The energy use and emissions per tonkm for each vessel was calculated (see Specific QMetaData for each flow).

	For each vessel, the loading capacity was stated in deadweight tonnes (Skeppsregister 1995), installed engine power in kW (Skeppsregister 1995) and speed in knots (Lloyds list). The share of two-stroke and four-stroke engines in each vessel was determined by the size of the vessel according to Alexandersson. All vessels in the population were then used to calculate an average value.
<b>Literature Reference</b>	Alexandersson, A., <i>Sjöfartens utsläpp av avgaser</i> , MariTerm, TFB-rapport 1991:18 Demker, G. et al. <i>Miljöeffekter av transportmedelsval för godstransporter</i> , MariTerm, KFB-rapport, 1994:6 <i>Skeppsregister 1995</i> , Swedish Shipowner Association Sjöbris, A., Flodström, E. <i>Emissions och energivärderingsprinciper för transportsystem</i> , MariTerm, KFB-rapport 1994:9 <i>Lloyds list</i> , 1996
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

### Flow Table and Specific Meta Data

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography

<b>Practitioner</b>	Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .

<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vessel, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p>Vessels are individuals, which means that the energy use and emissions for different vessels at a given size may vary greatly. The vessels are generally optimised for the shipping route on which it will operate and the cargo it will carry. Generally, smaller vessels in Swedish traffic operate shorter routes, while larger vessels are used for transports to the continent and transocean transports. Data for the individual vessel performing the transport should be used when possible. Data for Swedish flagged vessels that are members of the Swedish Shipowners' Association may be obtained from Elisabeth Sörheim at the Swedish Shipowners' Association.</p> <p><b>Type of vessels</b></p> <p><i>Freighters</i> - includes all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc. Freighters are mainly used for transportation of heavy goods over large distances. The energy use for tankers is generally lower than for other freighters.</p> <p><i>RoRo vessels</i> are used for transportation of different types of load carriers such as trailers, containers etc. The cargo is rolled on the vessel. RoRo vessels generally operate at a higher speed than regular freighters.</p> <p><i>Ferries</i> carry both passengers and goods. The goods are carried in trucks or trains.</p> <p><b>Fuel</b></p> <p>The fuel quality may vary to a large extent between different vessels. Smaller vessels that only operate on Swedish routes generally use better fuels. The main part of freighters in Swedish traffic use heavy fuel oil, with a sulphur content of 2,6 %. Small coastal freighters may however use gas oil with sulphur content of 0,1 %. Gas oil is the most refined type of fuel used in vessels (the maximum sulphur content is 1,5 %). In ferries, low sulphur fuel with sulphur content of 0,5 % is generally used.</p> <p>Differentiated harbour dues on sulphur and NOx emissions were introduced in Sweden 1 January 1998. This will probably result in use of fuels of a better quality, primarily in ferries but also other freighters.</p> <p><b>Reduction of emissions</b></p> <p>The data does not assume the use of any emission reducing measures. Different measures may be taken to reduce the emissions, e.g. water injection may reduce the emissions of NOx by 50%, and adjustments of the engine may reduce NOx emissions by 30 %. Catalytic converters may reduce NOx emissions by 90-100% and HC by 70-80%. Emissions of particles and HC are also reduced. Installation of catalytic converters is however a large investment for the shipowners. There are at present only a few vessels in Swedish traffic that has installed catalytic converters. The other measures constitute a smaller investment, and it is anticipated that the shipowners will chose these techniques to reduce emissions.</p> <p><b>Bulky goods</b></p> <p>Vessels generally handle transportation of large heavy goods over long distances. Some bulky goods are however transported by sea, primarily by RoRo vessels and ferries. The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Travelled distance</b></p> <p>The travelled distance of the goods may be estimated using a Nautic almanac, Lloyd. Since the utilisation level includes empty trips, no compensation in the distance for empty trips needs to be done.</p> <p><b>International sea transports</b></p> <p>When using the data for international traffic, the sulphur emissions should be adjusted, since the fuel quality may vary. Representative sulphur content of fuel used in international traffic is 3,3 %. The energy use and emissions of other parameters may also vary to a large extent depending on the quality of the fuel.</p>
<b>About Data</b>	<p>The data for emissions is derived from specific emission factors for the engine at a constant 80 % engine load. No test cycle was used to obtain the emission factors. There is however a small need for test cycles, since vessels generally operate at constant load on the engine during the sail. The fact that the engine load sometimes is lower than 80 % i.e. when sailing to and from the harbour has been neglected. This part is generally small but complicated.</p> <p>The calculation model may be used to calculate the energy use and emissions for a specific vessel if the loading capacity, installed engine power etc. is known. This information may be obtained from Skeppsregister. See QMetaData for details.</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is</p>

expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.

The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.

The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

## SPINE LCI dataset: Freighters, smaller than 2000 dwt, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Freighter, smaller than 2000 dwt, future
<b>Functional Unit</b>	1 tonkm, 50-60 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 50 % for tankers and 60% for other freighters. An utilisation level of 50 % for tankers and 60% for other freighters is representative for Swedish domestic traffic if <i>empty trips are included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Sea transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation i.e. propulsion of Swedish flagged freighters smaller than 2000 dwt (deadweight tonnes) with new technology reducing the energy use and emissions (catalytic converters, energy saving measures etc.). Only members of the Swedish Shipowners' Association are included.</p> <p>Freighters include all vessels except RoRo vessels and ferries. Freighters thus include a large variety of different vessels; tankers, container ships, LoLo vessels, bulk vessels, vessels built for a special route etc..</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water (e.g. discharges of oil) and emissions to ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents new technology, available today but not yet in use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 50 % for tankers and 60% for other freighters 60% (including empty trips)</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> </ul>

	-External conditions e.g. climate etc. -Maintenance level of the vessel  <i>Excluded subsystems</i> -Precombustion, i.e. production and distribution of the fuel. -Maintenance of the vessel (e.g. use of anti fouling) -After-treatment of the vessel -Handling of production rests
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The energy use and emissions was calculated using <i>assumptions</i> on energy saving and emission reducing actions together with data for existing individual vessels with the <i>lowest energy use and emissions</i> within the population of Swedish flagged freighters smaller than 2000 dwt, which are members of the Swedish Shipowners' Association vessels. The utilisation level with regard to weight is 50 % for tankers and 60% for other freighters%.</p> <p>The assumptions were given by the Swedish Shipowners' Association. The data for energy use and emissions for the vessels that was the basis for the calculation, and a description on how the data was obtained, can be found in the activity with ObjectOfStudy.Name: <i>Freighter, smaller than 2000dwt</i> (in this database) or in "Energi- och emissionsuppgifter för godstransporter". The minimum value for the energy use and emissions was used in the calculation. The following percentages for the reduction of energy use and emissions was used in the calculation: -Oil consumption: 30 % (by different energy saving measures) -NOx: 93 % (through optimisation of the engine and catalytic converters) -HC: 88 % (by catalytic converters) -CO: 81 % (by catalytic converters) -Particles: 35 % The sulphur content in the fuel was assumed to be 0,09 %. Emissions of SO2 were calculated from the fuel consumption using the sulphur content in the fuel. Emissions of CO2 were calculated from the fuel consumption using the carbon content in the fuel.</p>
<b>Literature Reference</b>	Energi- och emissionsuppgifter för godstransporter i Sverige, Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning 1997, NGM- Nätverket för Godstransporter och Miljön.
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

<b>About Inventory</b>	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Elisabeth Sörheim, Swedish Shipowners' Association, contact person for sea transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods

<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Sörheim, Elisabeth - The Swedish Shipowners Association, Box 53046, S-400 14 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The ambition with the data was to get a picture of future energy use and emissions for Swedish flagged freighters smaller than 2000 dead weight tonnes.</p> <p>The data represents new technology (catalytic converters, energy saving measures etc), not yet in regular use. There are at present only a few vessels in Swedish traffic that has installed catalytic converters, since installation of catalytic converters is a large investment for the shipowners.</p>
<b>About Data</b>	The data is based on assumptions on different energy saving and emission reducing actions together with data for existing vessels in Swedish traffic with the lowest energy use and emissions. The data was compiled by the Swedish Shipowners' Association. See Flow QMetaData for further information.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. <b>Publication</b>	<p>Master thesis: "LCA on converted fuel oil" by Daniel Strandberg and Christer Wik, MSc students Technical environmental planning, Chalmers University of Technology</p> <p>-----</p> <p>Data documented by: Daniel Strandberg and Christer Wik, MSc students, Technical Environmental Planning, Chalmers University of Technology</p> <p>Documentation reviewed and classified by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	Internal use at Recy Industri
<b>General Purpose</b>	The objective of this thesis was to carry out a Life Cycle Assessment for converted fuel oil. The analysis involves outlining the environmental hazardous steps in the production. The result will be used internally to aid as an environmental improving guidance as well as to receive a better view of the process. Externally, the result is a part of the Recy's ISO 14 000 certification which acts a guarantee to the costumers. The quality of the inquiry is set due the standards of a Master of Science thesis.
<b>Detailed Purpose</b>	To estimate the resource use during transportation by train.
<b>Commissioner</b>	Schaff, Lars, environmental manager - Recy Industri AB Box 48047 418 21 Göteborg Sweden.
<b>Practitioner</b>	Strandberg, Daniel and Christer Wik - MSc students Technical Environmental Planning Chalmers University of Technology 41296 Göteborg Sweden.
<b>Reviewer</b>	Beckman, Torsten - Technical environmental planning Chalmers University of Technology 412 96 Göteborg Sweden
<b>Applicability</b>	Data are valid for average freight-train in Sweden.
<b>About Data</b>	If data is utilised from this thesis it should be conducted with prudence. For receiving a more sufficient result for another activity, measurement should be utilised for each specific item in the production chain. However, the data represented in this study is of sufficient quality for being conducted when benchmarking.
<b>Notes</b>	The reviewer acted as a supervisor for the Master thesis: "LCA on converted fuel oil"

## SPINE LCI dataset: Fuel gas electricity energy system, EPD-version

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-10
<b>Copyright</b>	Bundesamt für Energie, Bern
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Fuel gas electricity energy system, EPD-version
<b>Functional Unit</b>	1 TJ net electricity from power plant
<b>Functional Unit Explanation</b>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	UCTPE countries Europe
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	UCTPE countries Europe
<b>Technical system description</b>	<p>Reported figures are based on data from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996 and adapted to the demands of the EPD-guidelines (Environmental Product Declaration guidelines in Sweden).</p> <p>-- Brief description --</p> <p>The phases inventoried in ETH's life cycle study of electricity generation with fuel gas (74,5% natural gas 36 MJ/m<sup>3</sup>, 6,9% coke oven gas 18 MJ/m<sup>3</sup>, 18,6% blast furnace gas 3,3 MJ/m<sup>3</sup>) are: exploration of natural gas, extraction (onshore and offshore), processing, long distance transport and storage, regional distribution and power plant operation. The average situation in the UCPTE* region in 1994 concerning the origin of the gas, compression and transport, processing (of gas with more or less sulphur content), distribution, power plant operation etc. is described. About 15% of the natural gas is extracted together with crude oil and 20% of natural gas used in the UCPTE is extracted offshore. Coke oven gas is produced in a cokery out of stone coal but is not described in detail in this documentation (see metadata in "Stone coal electricity energy system, EPD-version" and the original ETH study) but blast furnace gas is seen as a byproduct in steel production and is not charged with any environmental impact for its supply in this study.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle.</p> <p>-- Detailed description --</p> <p>Exploration of natural gas</p>

Drilling activities during exploration of natural gas have been inventoried regarding use of energyware, drilling chemicals, water, steel and concrete (coating of drilling holes) and use of land/sea bed (not included in the figures reported here, see other boundaries). Besides emissions arising due to use of energyware also emissions of methane and other volatile organic compounds from the drilling holes are included. Natural gas/crude oil emanating in drilling test is burnt, emissions are included.

Offshore exploration leads to emissions of drilling chemicals and drilling sludge to the sea, though a lot of it is cleaned on the platform before it is emitted. Other emissions to the sea are heavy metals from the drilled sea bed, oil and intraformation water. Some of the drilling chemicals and sludge is brought to the shore as waste.

Waste of onshore activities are of the same kind. It is put in landfills, in land farming or casted (emissions from these processes are included).

**Extraction of natural gas**

Average on- and offshore extraction has been inventoried regarding construction and demolition of platforms, towers, pipelines etc., use of energyware, materials (steel and concrete) and land/sea bed.

A first processing step of natural gas to remove sulphur (for gases with a high sulphur content,  $H_2S > 1\%$  by volume) is included as well as flaring of gas, leaks, blow-outs and low pressure venting (emissions of mercury and radioactive radon are accounted for since these elements are found in the gas).

Compression is used in the extracting process, for transportation to processing plant (onshore about 50 km) and for compensation of pressure losses in the processing plant. Gas turbines are used (10-20 MW) driven by not yet processed natural gas, raw gas.

Extraction of gas together with crude oil gives a higher energyware consumption than extraction of natural gas alone due to larger compression and processing need.

Production of production chemicals, for ex. anticorrosives, and drilling chemicals as well as emissions of those chemicals is included based on rough estimations.

Onshore, most of the intraformation water is assumed to be pumped into hollows deep in the ground the rest is led into a fresh water recipient. Offshore most of the intraformation water is emitted to the sea.

Shipping of supplies is included.

Production waste consists of scale i.e. mineral deposits in equipment and pipelines. Scale is low level radioactive.

**Processing of natural gas**

Processing implies removal of water and oil, higher hydrocarbons, sulphur (efficiency 98%), mercury and radon as well as gas drying. Processing of gas with a higher sulphur content is often done onshore and is supplied by grid electricity while gas with a low sulphur content often is processed in the field (supply by gas turbines). Construction phase and operation phase is included (also flaring and leaks). Processed gas has a lower heating value of 34.4 MJ/m<sup>3</sup> (density 0.8 kg/m<sup>3</sup>, 70% methane, sulphur content 0,002 g/m<sup>3</sup>).

**Long-distance transports of natural gas**

The average transport situation has been scanned. Transport in pipeline implies compression of the gas in several compressor stations with several natural gas driven gas turbines (10-20 MW). The average natural gas flow varies with pipeline, 0,77-1 million m<sup>3</sup> per h. Average transport distances are 800 km from the Netherlands, 1500 km from Norway, 800 km from Germany, 2500 km from Algeria and 6000 km from the former Soviet Union. Leakage rates for Russian natural gas are 0,5% for gas production and 1,5% for long distance transportation to Europe. For long distance transportation from other countries, a leakage rate of 0.01% per 1000 km is applied.

Construction of pipelines and seasonal storages (about 10% /year of the gas is stored), leaks, condensate separators, incineration of condensate and inspection flights are included. 64% of imported gas from Algeria is liquified (LNG): 15% of this gas is consumed for cooling of the gas. Transport is done by ship. Construction of gas containers is included but not of the ships themselves. Leaks are included.

**Regional distribution of natural gas**

The regional distribution implies gauging stations and pressure reducing stations, no further compressor stations are needed since the pressure from the long distance pipelines is enough. The regional distribution is however charged by some compression work done in the long distance pipeline system (0,2% of gas transported in the regional distribution network). The average transportation distance is set to 100 km. Medium gas flow: 30,3 TJ/km. Inspections and leaks are included.

**Power plant for fuel gas**

Fuel gas power plants are mainly used as top load plants with a low medium load (20%). Operation time is about 1800 h/year and electric efficiency is 39%. Fuel mix has been calculated from national statistics (including natural gas, coke oven gas and blast furnace gas) and fuel used for heat production (3,3% of total amount fuel gas used in the UCPT) has been subtracted. Construction and demolition of a 100 MWe steam turbin power plant has been inventoried. Data concerning operation emissions, water use and wastes has been found in literature and in public statistics and has been adapted to the UCPT fuel gas mix.

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

<b>Nature Boundary</b>	<p>Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for.</p> <p>Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).</p> <p>ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.</p> <p>Vattenfall's criterion in selecting and aggregating ETH's LCI-results for electricity generation in the UCPTE region has been to make the figures usable as general electricity LCI data in EPDs according to Miljöstyvningsrådets guidelines.</p> <p>Especially parameters (emissions) which have established impact indices - accepted by the EPD system - for one or several environmental impact categories, have been picked out and aggregated as far possible. But also metal and energyware resources have been included, as well as waste, in spite of all waste handling processes related to this dataset being included with respect to use of resources and emissions. The latter is an adaption to other LCI data for electricity generation where waste amounts are reported (since those flows have not been followed to the grave).</p> <p>Since ETH claims that most of the figures regarding metal emissions have an undefined amount of datagaps all metal emissions are aggregated except for a few which are specified separately since they are reported for most processes in the lifecycle. Metals are reported as elements although they often are part of compounds. Measuring methods often just give the amounts of the different elements found.</p> <p>All hydrocarbons to water are aggregated to one parameter as well as halogenated organics, since no indices exist (that are accepted by the EPD system so far) for characterisation of the individual substances.</p>
<b>Time Boundary</b>	<p>Most of statistic figures used are from 1990 to 1994. For the calculation of the UCPTE gas electricity, fuel use in Europe of the year 1993 has been used.</p> <p>Data concerning material, chemical and energyware use are partly older.</p> <p>Figures concerning other fuel extraction and processing represent an average of the early nineties.</p> <p>Descriptions and figures of different technical processes come from literature, contractors, public and private institutions and describe the situation of the late eighties.</p> <p>Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTE* countries between 1990-94 ( to level off the large variations in hydro power production over the years).</p> <p>All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.</p> <p>Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:</p> <p>Pipelines in the gas field 30 years Pipelines, long distance 50 years Pipelines, regional distribution 40 years Power plant 30 years</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Geographical Boundary</b>	<p>Most important supplier countries of natural gas in the UCPTE are the Netherlands (39%), the states of the former Soviet Union (22%), Algeria (11%), Norway (9%) and Germany (7%). The rest comes mainly from Italy, France and Denmark (these countries are not included in this study, approximated with German figures). Only the Swiss regional distribution net for natural gas has been inventoried as a whole. Resulting figures have been adapted to UCPTE* conditions.</p> <p>Processes conducted outside the UCPTE* region are supposed to be supplied with UCPTE* electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>

<b>Other Boundaries</b>	<p>Dismantling process of platforms is not included and the whole platform including drillhole mantelings and pipelines are assumed to be deposited, i.e. no recycling.</p> <p>Manufacture of needed chemicals in the processing plant for natural gas is neglected as well as the their transport.</p> <p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power.</p> <p>The ETH study comprises figures concerning use of land, usable content in water storages and amount of turbine water which have not been reported here. The two latter have been excluded due to lack of corresponding data in comparable studies.</p> <p>Use of land has been excluded here because of ETH's advanced approach. Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.</p> <p>Land Criterion Category          Natural human impact not larger than other species' since the industrial revolution I          Modified human impact larger than other species', low degree of cultivation II          Cultivated human impact larger than other species', large degree of cultivation III          Built upon dominated by buildings, roads, dams, mines etc. IV</p> <p>Category I is not used in the study.</p> <p>State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.</p> <p>ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m<sup>2</sup>year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below:          From category IV to category III 5 years          From category III to category II 50 years          From category II to category I 100 000 years</p> <p>(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)</p> <p>ETH specifies about 160 radioactive isotopes emitted to air and water. Radioactive emissions reported here are picked out in accordance with SETAC working group report on data quality and data availability (to be published in 2001).</p> <p>Big accidents occurring seldomly are not included. The threshold is fixes at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>Allocation of pipelines to the produced amount of gas is difficult. The total gas distribution network has been inventoried and related to the total amount of transported gas in 1994 assuming that this is representative.</p> <p>Allocation between natural gas and crude oil when extracted together has been conducted according to the lower heating value.</p> <p>Allocation between electricity and heat in fuel gas power plants has been done according to exergy.</p> <p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1985 to 1995
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCPTE countries in the early nineties.
<b>Method</b>	The data has been adapted from the Ökoinventare von Energiesystemen, ETH Zürich 1996 and is an aggregation of the LCI results for the module "Electricity from fuel gas power plant UCPTE-mix" (Strom ab Brenngas-Kraftwerk UCPTE-Mix).
<b>Literature Reference</b>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative

	Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<b>Notes</b>	The data is only valid for a flight distance of 600 km The energy use and emissions vary substantially during the different phases of the flight. A flight may be considered to consist of 5 phases - take-off, climb, cruise, descent and landing (including operations on the ground). The take-off and climb are the most energy demanding phases and give rise to extensive emissions. For flights over 300 km, the energy use and emissions at take-off, climb, descent and landing may be considered to be constant, independent of the flight distance.

Flow Table and Specific Meta Data

	Output	Product	Electricity	1		TJ	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) and processing of hazardous waste is included.	Output	Residue	Hazardous waste	2.23E+00		kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Highly radioactive waste	3.13E-06		m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, no emissions from landfill assumed. Inert waste deposit is waste at landfill that are inert.	Output	Residue	Inert waste deposit	4.66E+03		kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Low radioactive waste	2.71E-04		m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Medium and low radioactive waste	3.83E-05		m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from landfill. Reactive waste deposit is waste at landfill that is still reactive.	Output	Residue	Reactive waste deposit	3.62E+02		kg	Technosphere	
Notes: Internal flow! Infrastructure of spreading vehicles and emissions are included. Land farming is a treatment of organic sludge, the sludge is spread on a piece of land and left to degrade. Sometimes plants are grown on	Output	Residue	Waste in land farming	1.17E+02		kg	Technosphere	

the land, but those plants are destroyed.									
Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from incineration plant.	Output	Residue	Waste to incineration	8.73E-01			kg	Technosphere	

## About Inventory

<b>Publication</b>	<p>Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at <a href="http://www.energieforschung.ch">http://www.energieforschung.ch</a></p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by (see also Notes): Rolf Frischknecht, ESU-services, Switzerland Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden</p> <p>-----</p>
<b>Intended User</b>	Original study of ETH: LCA pra
<b>General Purpose</b>	<p>The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their lifecycles. The results can be used in lifecycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.</p> <p>Vattenfalls purpose - as a commissioner of putting ETH:s data into Spine format with metadata - is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstylningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines. Data is supposed to be used together with IEA statistics about electricity generation mixes in the OECD countries/regions.</p>
<b>Detailed Purpose</b>	ETH:s aim was to describe the average situation in Europe concerning electricity generation with fuel gas (a mix of natural gas, coke oven gas and blast furnace gas). With the help of assumptions and simplifications following phases of the life cycle are described: exploration (on- and offshore) extraction (on- and offshore), processing, long-distance transports, distribution and power plant.
<b>Commissioner</b>	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
<b>Practitioner</b>	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .
<b>Reviewer</b>	None, see further under notes -
<b>Applicability</b>	<p>Data reported here is supposed to be representative for fuel gas (natural gas, coke oven gas and blast furnace gas) electricity generation in the UCPTE countries in 1994.</p> <p>This set of data is aggregated and documented in accordance with the Swedish EPD-guidelines to be used in combination with IEA statistics concerning electricity generation mixes in OECD countries and regions together with other datasets - based on the ETH study - describing other power generation systems.</p> <p>The EPD-adapted power generation systems in Spine format are named as follows: Fuel gas electricity energy system, EPD-version Biofuel electricity energy system, EPD-version Hydro electricity energy system, EPD-version Lignite electricity energy system, EPD-version Nuclear electricity energy system, EPD-version Stone coal electricity energy system, EPD-version Wind electricity energy system, EPD-version</p> <p>IEA statistics for generation mixes 1998 exist in Spine format for the following 30 countries/regions: OECD total OECD North America OECD Pacific OECD Europe European Union Australia Austria Belgium Canada Czech Republic Denmark Finland France Germany Greece</p>

	<p>Hungary Iceland Ireland Italy Japan Korea Luxembourg Mexico Netherlands New Zealand Norway Poland Portugal Spain Sweden Switzerland Turkey United Kingdom United States</p>
<b>About Data</b>	<p>Reliability of data put into this lifecycle study:</p> <p>More reliable share of on- and offshore extraction amounts of flaring (allocation betw. oil and gas assumed) energyware consump. in extraction and processing phase constr. of extraction and processing plants transportation concerning construction aggregation to the UCPTe-mix for power plants fuel gas mix (natural, coke oven and blast furn. gas) conventional emissions from power plant</p> <p>Less reliable drilling during exploration and extraction amounts and concentrations in intraformation water processing of gas (except energyware) cleaning of trace elements in proc. plant area use gas leakage in the former Soviet Union lifetime of pipelines average gas flows in pipelines fuel chain of Algerian natural gas especially LNG route emissions of N<sub>2</sub>O, NMVOC, CO</p> <p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided.</p> <p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.</p>
<b>Notes</b>	<p>Reviewer of this specification of ETH:s data and metadata has been: Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of aggregation of figures and of Vattenfall's interpretation of the documentation Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements. The technical committee of the Swedish Environmental Management Council - approval of method and aggregation of parameters</p> <p>Project Management of the ETH study, 3rd edition: Professor, Dr. P. Suter and R. Frischknecht, ETH</p> <p>Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH R. Dones, E. Zollinger, Paul Scherrer Institut</p> <p>Authors of the 1st edition: N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gräniher, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger Authors of the überarbeitung, 3rd edition: U. Bollens, S. Bosshart, M. Ciot, L. Ciseri, G. Doka, R. Frischknecht, R. Hischer, A. Martin, ETH R. Dones, U. Gantner, Paul Scherrer Institut</p> <p>----- --- Changes made to the data set after publishing in SPINE@CPM--- &gt;&gt;&gt; 6 June 2001: &lt;&lt;&lt; Changes made by Ann-Christin Pålsson, CPM based on discussions with Caroline Setterwall, Vattenfall AB.</p> <p>Comments: The following changes has been made in the nomenclature for in- and outflows: Mangane in ore -&gt; changed to: Manganese in ore CH<sub>4</sub> -&gt; changed to: Methane (to be in accordance with the nomenclature specified in CPM</p>

report 2000:2)  
 CN -> changed to: CN-  
 Stone coal -> changed to: Hard coal (to be in accordance with the nomenclature specified in CPM report 2000:2)  
 Other metals -> changed to: Metals

Explanations of nomenclature (inserted in Notes for the specific flows):

- CN- is Cyanide ion
- Reactive waste deposit is waste at landfill that is still reactive.
- Inert waste deposit is waste at landfill that are inert.

Additional clarifications:

- Note that the flows of waste in the table of in- and outflows are internal flows, i.e. they do NOT cross the system boundaries. All waste handling processes is included in the study with respect to use of resources and emissions.
- Radioactive waste is accounted for in cubic metres. The product specific requirements for electricity and district heating generation (PSR 1998: 1) in the Swedish EPD system states that waste shall be accounted for in gram. However, no conversion factors were given in the study. There are also no general conversion factors that are commonly used.

<b>Availability</b>	Public

Technical System	
<b>Name</b>	Fuel gas electricity energy system, ETH - full version
<b>Functional Unit</b>	1 TJ net electricity from power plant
<b>Functional Unit Explanation</b>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	UCTPE countries Europe
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	UCTPE countries Europe
<b>Technical system description</b>	<p>Reported figures come from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996.</p> <p>Brief description</p> <p>The phases inventoried in ETH's life cycle study of electricity generation with fuel gas (74,5% natural gas 36 MJ/m<sup>3</sup>, 6,9% coke oven gas 18 MJ/m<sup>3</sup>, 18,6% blast furnace gas 3,3 MJ/m<sup>3</sup>) are: exploration of natural gas, extraction (onshore and offshore), processing, long distance transport and storage, regional distribution and power plant operation. The average situation in the UCPTE* region in 1994 concerning the origin of the gas, compression and transport, processing (of gas with more or less sulphur content), distribution, power plant operation etc. is described. About 15% of the natural gas is extracted together with crude oil and 20% of natural gas used in the UCPTE is extracted offshore. Coke oven gas is produced in a cokery out of stone coal but is not described in detail in this documentation (see metadata in "Stone coal electricity energy system, EPD-version" and the original ETH study) but blast furnace gas is seen as a byproduct in steel production and is not charged with any environmental impact for its supply in this study.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle.</p>

#### Detailed description

##### Exploration of natural gas

Drilling activities during exploration of natural gas have been inventoried regarding use of energyware, drilling chemicals, water, steel and concrete (coating of drilling holes) and use of land/sea bed. Besides emissions arising due to use of energyware also emissions of methane and other volatile organic compounds from the drilling holes are included. Natural gas/crude oil emanating in drilling test is burnt, emissions are included.

Offshore exploration leads to emissions of drilling chemicals and drilling sludge to the sea, though a lot of it is cleaned on the platform before it is emitted. Other emissions to the sea are heavy metals from the drilled sea bed, oil and intraformation water. Some of the drilling chemicals and sludge is brought to the shore as waste.

Waste of onshore activities are of the same kind. It is put in landfills, in land farming or casted (emissions from these processes are included).

##### Extraction of natural gas

Average on- and offshore extraction has been inventoried regarding construction and demolition of platforms, towers, pipelines etc., use of energyware, materials (steel and concrete) and land/sea bed.

A first processing step of natural gas to remove sulphur (for gases with a high sulphur content,  $H_2S > 1\%$  by volume) is included as well as flaring of gas, leaks, blow-outs and low pressure venting (emissions of mercury and radioactive radon are accounted for since these elements are found in the gas).

Compression is used in the extracting process, for transportation to processing plant (onshore about 50 km) and for compensation of pressure losses in the processing plant.

Gas turbines are used (10-20 MW) driven by not yet processed natural gas, raw gas.

Extraction of gas together with crude oil gives a higher energyware consumption than extraction of natural gas alone due to larger compression and processing need.

Production of production chemicals, for ex. anticorrosives, and drilling chemicals as well as emissions of those chemicals is included based on rough estimations.

Onshore, most of the intraformation water is assumed to be pumped into hollows deep in the ground the rest is led into a fresh water recipient. Offshore most of the intraformation water is emitted to the sea.

Shipping of supplies is included.

Production waste consists of scale i.e. mineral deposits in equipment and pipelines. Scale is low level radioactive.

##### Processing of natural gas

Processing implies removal of water and oil, higher hydrocarbons, sulphur (efficiency 98%), mercury and radon as well as gas drying. Processing of gas with a higher sulphur content is often done onshore and is supplied by grid electricity while gas with a low sulphur content often is processed in the field (supply by gas turbines). Construction phase and operation phase is included (also flaring and leaks). Processed gas has a lower heating value of 34.4 MJ/m<sup>3</sup> (density 0.8 kg/m<sup>3</sup>, 70% methane, sulphur content 0,002 g/m<sup>3</sup>).

##### Long-distance transports of natural gas

The average transport situation has been scanned. Transport in pipeline implies compression of the gas in several compressor stations with several natural gas driven gas turbines (10-20 MW). The average natural gas flow varies with pipeline, 0,77-1 million m<sup>3</sup> per h. Average transport distances are 800 km from the Netherlands, 1500 km from Norway, 800 km from Germany, 2500 km from Algeria and 6000 km from the former Soviet Union. Leakage rates for Russian natural gas are 0,5% for gas production and 1,5% for long distance transportation to Europe. For long distance transportation from other countries, a leakage rate of 0.01% per 1000 km is applied.

Construction of pipelines and seasonal storages (about 10% /year of the gas is stored), leaks, condensate separators, incineration of condensate and inspection flights are included. 64% of imported gas from Algeria is liquified (LNG): 15% of this gas is consumed for cooling of the gas. Transport is done by ship. Construction of gas containers is included but not of the ships themselves. Leaks are included.

##### Regional distribution of natural gas

The regional distribution implies gauging stations and pressure reducing stations, no further compressor stations are needed since the pressure from the long distance pipelines is enough. The regional distribution is however charged by some compression work done in the long distance pipeline system (0,2% of gas transported in the regional distribution network). The average transportation distance is set to 100 km. Medium gas flow: 30,3 TJ/km. Inspections and leaks are included.

##### Power plant for fuel gas

Fuel gas power plants are mainly used as top load plants with a low medium load (20%). Operation time is about 1800 h/year and electric efficiency is 39%. Fuel mix has been calculated from national statistics (including natural gas, coke oven gas and blast furnace gas) and fuel used for heat production (3,3% of total amount fuel gas used in the UCPT) has been subtracted. Construction and demolition of a 100 MWe steam turbin power plant has been inventoried. Data concerning operation emissions, water use and wastes has been found in literature and in public statistics and has been adapted to the UCPT fuel gas mix.

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

<p><b>Nature Boundary</b></p>	<p>Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).</p> <p>Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.</p> <p>Land Criterion Category          Natural human impact not larger than other species' since the industrial revolution I          Modified human impact larger than other species', low degree of cultivation II          Cultivated human impact larger than other species', large degree of cultivation III          Built upon dominated by buildings, roads, dams, mines etc. IV</p> <p>Category I is not used in the study.</p> <p>State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.</p> <p>ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m<sup>2</sup>year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below:          From category IV to category III 5 years          From category III to category II 50 years          From category II to category I 100 000 years</p> <p>(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)</p> <p>ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.</p>
<p><b>Time Boundary</b></p>	<p>Most of statistic figures used are from 1990 to 1994. For the calculation of the UCPT* gas electricity, fuel use in Europe of the year 1993 has been used.</p> <p>Data concerning material, chemical and energyware use are partly older.</p> <p>Figures concerning other fuel extraction and processing represent an average of the early nineties.</p> <p>Descriptions and figures of different technical processes come from literature, contractors, public and private institutions and describe the situation of the late eighties.</p> <p>Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPT* countries between 1990-94 ( to level off the large variations in hydro power production over the years).</p> <p>All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.</p> <p>Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:</p> <p>Pipelines in the gas field 30 years          Pipelines, long distance 50 years          Pipelines, regional distribution 40 years          Power plant 30 years</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<p><b>Geographical Boundary</b></p>	<p>Most important supplier countries of natural gas in the UCPT* are the Netherlands (39%), the states of the former Soviet Union (22%), Algeria (11%), Norway (9%) and Germany (7%). The rest comes mainly from Italy, France and Denmark (these countries are not included in this study, approximated with German figures). Only the Swiss regional distribution net for natural gas has been inventoried as a whole. Resulting figures have been adapted to UCPT* conditions.</p> <p>Processes conducted outside the UCPT* region are supposed to be supplied with UCPT* electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following</p>

	countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.
<b>Other Boundaries</b>	<p>Dismantling process of platforms is not included and the whole platform including drillhole mantelings and pipelines are assumed to be deposited, i.e. no recycling.</p> <p>Manufacture of needed chemicals in the processing plant for natural gas is neglected as well as the their transport.</p> <p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTPE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power.</p> <p>Big accidents occuring seldomly are not included. The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>Allocation of pipelines to the produced amount of gas is difficult. The total gas distribution network has been inventoried and related to the total amount of transported gas in 1994 assuming that this is representative.</p> <p>Allocation between natural gas and crude oil when extracted together has been conducted according to the lower heating value.</p> <p>Allocation between electricity and heat in fuel gas power plants has been done according to exergy.</p> <p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1985 to 1995
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCPTPE countries in the early nineties.
<b>Method</b>	The figures have been copied from the module "Electricity from fuel gas power plant UCPTPE-mix" (Strom ab Brenngas-Kraftwerk UCPTPE-Mix) in the Ökoinventare von Energiesystemen, ETH Zürich 1996.
<b>Literature Reference</b>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<b>Notes</b>	Multiple flows are reported for several emissions to air. This is because that in the original study emissions to air have been reported in three categories, indicated by one of the letters below following the substance name. - m = mobile (emissions from vehicles) - p = process (process specific emissions as for instance methane emissions during coal mining) - s = stationary (emissions from stationary combustion plants) This categorisation has however not been documented in this specification in the SPINE format.

About Inventory	
<b>Publication</b>	<p>Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at <a href="http://www.energieforschung.ch">http://www.energieforschung.ch</a></p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by (see also Notes):  Rolf Frischknecht, ESU-services, Switzerland  Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden  -----</p>
<b>Intended User</b>	Original study of ETH: LCA pra
<b>General Purpose</b>	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their lifecycles. The results can be used in lifecycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.
<b>Detailed Purpose</b>	ETH:s aim was to describe the average situation in Europe concerning electricity generation with fuel gas (a mix of natural gas, coke oven gas and blast furnace gas). With the help of assumptions and simplifications following phases of the life cycle are described: exploration (on- and offshore) extraction (on- and offshore), processing, long-distance transports, distribution and power plant.
<b>Commissioner</b>	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
<b>Practitioner</b>	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .
<b>Reviewer</b>	None, see further under notes -
<b>Applicability</b>	Reported figures are supposed to be representative for fuel gas (natural gas, coke oven gas and blast furnace gas) electricity generation in the UCPTE countries in 1994.
<b>About Data</b>	<p>Reliability of data put into this lifecycle study:</p> <p>More reliable  share of on- and offshore extraction  amounts of flaring (allocation betw. oil and gas assumed)  energyware consump. in extraction and processing phase  constr. of extraction and processing plants  transportation concerning construction  aggregation to the UCPTE-mix for power plants  fuel gas mix (natural, coke oven and blast furn. gas)  conventional emissions from power plant</p> <p>Less reliable  drilling during exploration and extraction  amounts and concentrations in intraformation water  processing of gas (except energyware)  cleaning of trace elements in proc. plant  area use  gas leakage in the former Soviet Union  lifetime of pipelines  average gas flows in pipelines  fuel chain of Algerian natural gas especially LNG route  emissions of N<sub>2</sub>O, NMVOC, CO</p> <p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided).</p> <p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.</p>

## SPINE LCI dataset: Gas-turbine power plant with support systems

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-12-01
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Gas-turbine power plant with support systems
<b>Functional Unit</b>	Net production of 1 kWh electricity
<b>Functional Unit Explanation</b>	The emissions and use of resources and raw materials are associated with the production of 1 kWh electricity.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	
<b>Technical system description</b>	<p>The studied system include <i>fuel production and operation and maintenance of a gas-turbine power plant</i>. To represent the electricity production of Vattenfall in gas-turbine power plants, a prospected gas turbine power plant constructed and located in a similar way as the gas turbine power plant in Slite, Gotland is studied. The power plant is assumed to operate on fuel oil 1 (Eo1) produced from crude oil from the Norwegian continental-shelf. The fuel has a sulphur content of 0,1 %.</p> <p>Vattenfall:s gas turbine plants are used as reserve power and primarily at transient needs. Production of materials, chemicals and electricity and transports, used in association with the fuel chain and the operation and maintenance of the plant are included.</p> <p><i>The fuel production</i> include drilling and extraction of crude oil, maintenance and reinvestments of the oil platforms, transport to the refinery in Mongstad, Norway, where the oil is refined to fuel oil 1 and transport from the refinery to the power plant.</p> <p>Gas turbines generally operates on gasoil (lighter fractions of diesel oil and fuel oil 1 (Eo1)) with strict requirement on low metal content. The fuel is stored in cylindrical oil cisterns. Gas turbines can also operate on kerosene.</p>

*Technical data* for the studied plant  
 Annual time of use (recalculated as operation time at full effect) (hours): 50  
 Supplied fuel effect (MW): 444  
 Electricity effect (net) (MW): 120  
 Assumed life-time (years): 60  
 Electricity production (net) during 60 years (TWh): 0,0360

## System Boundaries

### *Nature Boundary*

The analysis starts with *extraction of crude oil*.

All emissions are considered equivalent, independent of where they take place (locally, regionally, globally; in densely populated areas or rural areas).

### *Time Boundary*

The power plant are assumed to operate during 60 years.

### *Geographical Boundary*

The power plant is located in a similar way as the power plant in Slite, Gotland. The fuel used in the plant are refined from crude oil from the Norwegian continental-shelf. The oil is transported by tanker to the refinery in Mongstad (Norway), and then as fuel oil 1 with tanker to the power plant.

### *Other Boundaries*

The studied system includes *fuel production and operation and maintenance of a gas-turbine power plant*. Calculations of building and demolition of the plant has been performed but are not included in this system.

#### ***Sub-systems included in the system:***

- Drilling and extraction of oil, and maintenance and reinvestments of the oil platforms.
- Known use of chemicals are accounted for. In the cases where it was possible to obtain data, resource use and emissions for the manufacture are included.
- Use of resources and emissions to air from production of the electricity that is used in the life cycles.
- Production of oil for the studied manufacturing processes and transports
- Transports and manufacture of materials for maintenance are included but neglected in the calculations, since they have a small contribution.
- Transports in association with the operation of the power plant.

#### ***Sub-systems excluded from the system:***

- No reinvestments are included since the plant only is used for reserve power.
- Equipment after the power station transformer.
- Prospecting for oil and building and demolition of plants and production platforms and tanker for transport from the oil field in Norway to Gotland.
- Waste and rest products are transported to final waste. Operation and chemical and biological decomposing processes in the final waste have not been considered.
- The risk of major accidents and rare breakdowns and environmental consequences from these
- Work environment
- Environmental loads caused by the operation personnel
- Emissions at ordinary occurring operation disturbances have not been studied.

<b>Allocations</b>	<p>The <i>50/50 method</i> has been applied throughout the calculations. The method is described in "Nordic Guidelines on Life-Cycle Assessment", Nord 1995: 20, The Nordic Council, Stockholm.</p> <p>Crude oil for production of fuel to the plant are assumed to be extracted together with natural gas. Data were obtained from Kristin Keiserås Bakkane, Novatech a.s. "Life Cycle Data for Norwegian Oil and Gas", that were based on the production at Norwegian oil fields in 1991. An average value for the extracted energy oil (78,6%) and gas (21,3%) for the year in question were used. In reality the distribution between extracted energy for oil and gas respectively, varies. Data has been allocated according to the average value, <i>i.e. 78,6% of emissions and use of resources are allocated to the crude oil production</i>. Equipment, use of resources and emissions used only in association with the extraction of one energyware are allocated 100% to that.</p> <p>The oil is assumed to be refined in Mongstad, Norway. Data for production of fuel oil 1 have been obtained from Statoil. The allocation between the different products in the refinery are not known.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	An LCA calculation of fuel production and operation and maintenance for a gas-turbine power plant.
<b>Literature Reference</b>	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S., "Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport", in Swedish, Vattenfall AB
<b>Notes</b>	The parameters that are presented are chosen because they have a general interest and because the basis for these parameters are relatively good. All values are reported with 3 figures. The data are however seldom that accurate.

About Inventory	
<b>Publication</b>	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S., "Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport", Vattenfall AB Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology
<b>Intended User</b>	The data can be used as a basis
<b>General Purpose</b>	<ul style="list-style-type: none"> <li>• The work with life-cycle analysis are expected to <i>contribute to a reinforcement and structuring</i> of the environmental work within Vattenfall, and a deeper knowledge on the use of resources and emissions to the environment.</li> <li>• An LCA can <i>facilitate a need for reliable data for electricity production</i>. Electricity is used in the manufacture of almost every product, and data from an LCA can be used when conducting an LCA on products.</li> <li>• An LCA can <i>facilitate a choice between different techniques</i> for future electricity production.</li> <li>• An LCA can also help to <i>choose the most effective alternatives</i> to reduce the consumption of resources and environmental influence of the current electricity production system.</li> <li>• It is also possible to <i>compare</i> the environmental load for different alternatives of electricity production.</li> </ul>
<b>Detailed Purpose</b>	To obtain a <i>reliable basis</i> to be able to perform life-cycle analyses of different types of electricity use, and to identify opportunities for improvements in the existing system. To identify data gaps and areas where the knowledge are poor.
<b>Commissioner</b>	- Vattenfall Elproduktion .
<b>Practitioner</b>	- Vattenfall Energisystem AB: Britt-Marie Brännström-Norberg Ulrika Dethlefsen Roland Johansson Caroline Setterwall Sofie Tunbrant .
<b>Reviewer</b>	- Thomas Ekvall, Chalmers Industriteknik (CIT) Gunnar Lindfors, Institutet för Vatten- och Luftvårdsforskning (IVL) Göran Finnveden, Institutet för Vatten- och Luftvårdsforskning (IVL)
<b>Applicability</b>	<p>The studied system includes <a href="#">fuel production and operation and maintenance</a> of a gas-turbine power plant. The analysis is based on data from a plant that are chosen to make the analysis <i>representative</i> for the operation and maintenance of <i>Vattenfall:s gas-turbine power plants</i>. Vattenfall:s gas turbine plants are used as reserve power and primarily at transient needs. The data is reliable since a specific plant have been studied. The consequence is however that the result is primarily valid for the studied plant. Thoroughly reliable data for every power source, requires life cycle analyses for a large number of power plants for every power source. There are 12 gas turbine plants in Sweden.</p> <p><a href="#">Transmission and distribution losses are not included</a>. When the result is used to study different types of electricity use, these losses should be included. A rough estimate are that the distribution losses for a large industry customer are approximately 5% of the bought electricity, i.e. to obtain data for the use of electricity the data should be multiplied with 1,05. For an average household customer the transmission losses are approximately 10% of the bought electricity, i.e. the data should be multiplied with 1,10.</p> <p>The choice of <i>emission data</i> has a major influence on the result. This is determined at the permit consideration for a plant, and may vary between different plants and countries. The choice of combustion technique and fuel also influence the result. In recent years water injection have been introduced in some of Vattenfall:s gas turbines. Water injection reduces the NOx emissions but also the degree of efficiency for electricity production. Gas turbines can be operated on kerosene or fuel oil 1 (Eo1), where Eo1 oil gives higher emissions of sulphur.</p> <p>The calculated <i>emissions from Norwegian oil extraction</i></p>

	<p>are probably not representative for oil that will be extracted in a few years. The emissions of NO<sub>x</sub> and CO<sub>2</sub> will be reduced. The emissions from the gas-turbines used for electricity production on the oil platforms will be reduced by installation of low-NO<sub>x</sub>-burners. For some turbines the NO<sub>x</sub> emissions are estimated to be reduced by 80%. To reduce CO<sub>2</sub> emissions, Norwegian authorities have introduced a CO<sub>2</sub>-charge. Use of gas-turbines, with a higher degree of efficiency will reduce the CO<sub>2</sub>-emissions. The new oil-field, Trollfältet, taken in use in 1995 will use electricity from the Norwegian power net, which will reduce local emissions on the platform.</p> <p>The complete study include building, operation and maintenance, and demolition of the power plant and fuel production. When the data is used for energy production in a life cycle analysis of a product or a system, that do not require expansion of the electricity production system, it however reasonable only to include fuel production and operation and maintenance. The other phases of the life cycle are the same independent on the electricity production.</p>
<b>About Data</b>	<p>The studied plant is a <i>prospected gas turbine power plant fired with fuel oil 1</i>, produced from crude oil from the Norwegian continental-shelf. It is constructed and located in a similar way as the gas turbine power plant in Slite, Gotland.</p> <p>Data for the use of resources and energy for operation of the power stations are specific for the studied plant. Relevant data for transports, extraction and production of metals and chemicals, and manufacture and work on important components were hard to obtain. Data from manufacturers and other reports and studies, primarily life cycle analyses have been used. Production of material and transports are considered with current technology. Swedish standard values have been used to calculate fuel use and emissions from transports. Transport distances are specific for the operation of the plant.</p> <p><i>The parameters that are presented</i> are chosen because they have a general interest and because the basis for these parameters are relatively good. All values are reported with 3 figures. The data are however seldom that accurate.</p> <p>Data for <i>extraction of crude oil</i> were obtained from Kristin KeiserOs Bakkane, Novatech a.s. "Life Cycle Data for Norwegian Oil and Gas", that were based on the production at Norwegian oil fields in 1991.</p> <p>The following <i>emission factors</i> have been used to calculate the emissions from operation of the power plant. The emission factors are based on an average of the emissions from Vattenfall's existing gas-turbines.</p> <p>NO<sub>x</sub>: 220 mg/MJ fuel; 30,8 g/kWh electricity  SO<sub>2</sub>: 48 mg/MJ fuel; 0,667 g/kWh electricity  CO: 77 mg/MJ fuel; 1,08 g/kWh electricity  Particles: 3,4 mg/MJ fuel; 0,047 g/kWh electricity  CO<sub>2</sub>: 70400 mg/MJ fuel; 986 g/kWh electricity  HC: 4,0 mg/MJ fuel; 0,056 g/kWh electricity</p> <p>For electricity used in the manufacture of materials and fuels, <i>average electricity</i> for the respective countries distributed on the different electricity production alternatives have been used. The following <i>degrees of efficiencies</i> have been used to calculate the fuel used in the electricity production. The values are standard values for existing power plants. New modern plants have often higher degrees of efficiencies. The values are calculated from the effective heat value in the used fuels and the energy content in the steam produced in a nuclear power plant.</p> <ul style="list-style-type: none"> <li>• Coal condensing: 40%</li> <li>• Oil condensing: 40%</li> <li>• Natural gas condensing/combination: 40%</li> <li>• Gas turbine: 25%</li> <li>• Combined heat and power plant(irrespective of fuel) 30% (for electricity production) 85% (total for electricity and heat production)</li> <li>• Water power: are not recalculated, are accounted for as kWh electricity</li> </ul>

	<ul style="list-style-type: none"> <li>Nuclear power: 33%, are however not recalculated, but accounted for as kWh electricity or gram natural uranium.</li> </ul>

## SPINE LCI dataset: General Purpose Polystyrene (GPPS)

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1993
<b>Copyright</b>	
<b>Availability</b>	

Technical System	
<b>Name</b>	General Purpose Polystyrene (GPPS)
<b>Functional Unit</b>	1 kg GPPS (first ed.)
<b>Functional Unit Explanation</b>	
<b>Process Type</b>	Cradle to gate
<b>Site</b>	
<b>Sector</b>	Materials and components
<b>Owner</b>	
<b>Technical system description</b>	<p>Polystyrene is a versatile polymer resin used in a wide range of applications - especially in the packaging industry. It is sold in the three main domains : crystal or general purpose polystyrene, high impact polystyrene and expandable polystyrene.</p> <p>The production of styrene monomer can be thought of as replacing one of the hydrogen atoms in ethylene by a benzene ring (C<sub>6</sub>H<sub>6</sub>). The monomer is then polymerised in a manner similar to the polyethylene.</p> <p>In practise, the production route from crude oil and natural gas is as shown in figure 11. Crude oil refining produces a fraction known as naphtha which contains a mixture of low molecular weight, saturated hydrocarbons of various composition. This is converted into smaller group of unsaturated hydrocarbons by cracking. The resulting mixture is then separated into its constituent components by distillation producing principally ethylene (C<sub>2</sub>H<sub>4</sub>), propylene (C<sub>3</sub>H<sub>6</sub>), mixed butenes of general formula C<sub>4</sub>H<sub>8</sub> and a number of other compounds which find uses elsewhere in the petrochemical plant either as feedstocks or fuels.</p> <p>Although benzene is usually present in small quantities in crude oil, its direct extraction is usually uneconomic. Benzene can also be produced from naphtha by a process known as catalytic reforming. It is assumed that 50% is derived from each source.</p>

## SPINE LCI dataset: Glassworks

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1991-01-01
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Glassworks
<b>Functional Unit</b>	1 kg
<b>Functional Unit Explanation</b>	1 kg of glass
<b>Process Type</b>	Gate to gate
<b>Site</b>	PLM AB, Limmared, Sweden
<b>Sector</b>	Consumer goods
<b>Owner</b>	PLM AB, Limmared, Sweden
<b>Technical system description</b>	<p>PLM AB in Limmared produces both flint and amber glass. Glass is made mainly from the raw materials sand, soda, lime, dolomite and feldspar which are fused at 1500-1600 degrees Celsius. It is a continuous production process and the raw materials are constantly added, while the finished glass is taken out and cut into pieces suitable for the product which is shaped in the glass machine.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>The observed nature boundary parameters are the emissions of NO<sub>x</sub>, SO<sub>2</sub>, CO<sub>2</sub> and particulates to air and the emissions of suspended solids, oil and fat to water.</p> <p>Emissions from combustion (production) of electricity, LPG (Liquefied petroleum gas) and oil consumption are included.</p> <p>The emission factors for stationary installations of oil combustion is not included.</p>
<b>Time Boundary</b>	
<b>Geographical Boundary</b>	The process takes place in Limmared, Sweden.
<b>Other Boundaries</b>	<p>Observed parameters are electricity, LPG (Liquefied petroleum gas) and oil consumption.</p> <p>Further broken glass, sand, soda, lime, dolomite, feldspar and sodium sulphate come from the technosphere and glass go to the technosphere.</p> <p>No transports are included.</p>

<b>Allocations</b>	
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1991-01-01
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	Literature study of an official governmental report, where a literature study and personal communication have been put together (Baumann et al.) The calculations of energyware and CO2 emissions are made by those who transformed the data set into SPINE-format.
<b>Literature Reference</b>	Baumann H, Eriksson E, Rydberg T, Tillman A-M "Life cycle analysis of selected packaging materials. Quantification of environmental loadings." Offprint from SOU 1991:77, Chalmers Industriteknik, Göteborg, Sweden The literature study in the literature mentioned above is done from the permission according to the Swedish Environmental Protection Law for PLM AB, Limmared at The Board of County in Älvsborg, The Environmental control unit 1990 and Sundström G, "Energiförbrukning och miljöbelastning för distributionssystem för öl och läsk i Sverige", Miljöbalans Gustav Sundström AB 1990. Personal communication contact is Eriksson K J, PLM AB, Limmared, Sweden and Nyström E, Svensk glasåtervinning AB, Sweden.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

<b>Flow Table and Specific Meta Data</b>									
<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>
Notes: There is 1-2% moisture content in broken glass.	Input	Refined resource	Broken glass	366			g	Technosphere	
	Input	Refined resource	Dolomite	58			g	Technosphere	
Notes: This electricity is used for fans, assembly lines etc.	Input	Refined resource	Electricity	0.4			MJ	Technosphere	
Notes: For the melting process oil and electricity are needed in an amount of 1050-1150 kcal/tonne molten glass, depending on capacity utilisation. 7-8% of this is electrical energy. The figures are valid for the mix of 50% broken glass and 50% virgin raw material. A 2% energy saving is achieved per 10% broken glass added.	Input	Refined resource	Energyware		1.05	1.15	kcal	Technosphere	
	Input	Refined resource	Feldspar	43			g	Technosphere	
	Input	Refined resource	Lime	83			g	Technosphere	
Notes: LPG (Liquefied petroleum gas) is used at this rate irrespective of the amount of broken glass added in the melting process.	Input	Refined resource	LPG	0.564			MJ	Technosphere	
Notes: It is 5% moisture content in sand.	Input	Refined resource	Sand	76			g	Technosphere	
Notes: Soda is represented by 50% natural soda from the US and 50% Solvay soda.	Input	Refined resource	Soda	136			g	Technosphere	
	Input	Refined resource	Sodium sulphate	4			g	Technosphere	
Method: Carbon dioxide emissions are caused by the burning of oil and gas and by the release of gas from the melt. CO2 emissions in the form of melting losses amounts to approx. 170 g CO2/kg virgin raw material. Glass is made mainly from the raw materials sand (76 g), soda (136 g), lime (83 g), dolomite (58 g) and feldspar (43 g). Thus, the total amount of virgin raw material that is needed to produce 1 kg glass is 396 g. The carbon dioxide emissions are $170 \text{ g} \cdot 0,396 = 67,32 \text{ g}$ . Notes: Carbon dioxide emissions are caused by the burning of oil and gas and	Output	Emission	CO2	67.32			g	Air	

by the release of gas from the melt. CO2 emissions in the form of melting losses amounts to approx. 170 g CO2/kg virgin raw material. The carbon dioxide emissions are also dependent on the proportion of broken glass added, because the consumption of fuel varies according to this amount.								
	Output	Emission	NOx	2.69			g	Air
	Output	Emission	Oil and fat	0.009			g	Water
	Output	Emission	Particulates	0.26			g	Air
	Output	Emission	SO2	1.01			g	Air
	Output	Emission	Susp solids	0.018			g	Water
	Output	Product	Glass	1			kg	Technosphere

## About Inventory

<b>Publication</b>	<p>Baumann H, Eriksson E, Rydberg T, Tillman A-M "Life cycle analysis of selected packaging materials. Quantification of environmental loadings." Offprint from SOU 1991:77, Chalmers Industriteknik, Göteborg, Sweden</p> <p>-----</p> <p>Data documented by: Maria Erixon and Sara Ågren, project employed at Technical Environmental Planning, Chalmers University of Technology</p> <p>Documentation reviewed by: Henrikke Baumann and Anne-Marie Tillman (responsible for the course material) and Ann-Christin Pålsson (responsible for classification of the dataset), Technical Environmental Planning, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	A Life Cycle Assessment practice
<b>General Purpose</b>	To investigate what energy needs and emissions that is connected with the production and use of packaging material.
<b>Detailed Purpose</b>	<p>To calculate the energy need and emission for the following scenarios:</p> <p>(1) Glass produced from 100% virgin raw materials; waste to dump.</p> <p>(2) Glass produced from 30% virgin raw materials, that is 70% is recycled material; waste to dump.</p> <p>(3) Glass produced from 100% virgin raw materials, 97% is washed-up containers for recycling (thirteen times)</p>
<b>Commissioner</b>	- Swedish commission of packaging.
<b>Practitioner</b>	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden .
<b>Reviewer</b>	
<b>Applicability</b>	<p>Glass containers can be refilled and this is done on a large scale in the case of beverage containers for beer, soft drinks and spirits. Glass can also be recovered from broken glass, which is remelted. Uncoloured glass can only be made from uncoloured broken glass, while coloured glass can be produced from unsorted raw materials.</p> <p>-----</p> <p>The emission factors for stationary installations of oil combustion can be found under the activity "Combustion of oil" in this database.</p>
<b>About Data</b>	<p>It may be assumed that soda consist of 50% natural soda from the US and 50% Solvay soda.</p> <p>Melting losses occur in the form of carbon dioxide from lime and soda together with loss of water from sand and broken glass. There is 1-2% moisture content in broken glass and 5% moisture content in sand.</p> <p>For the melting process oil and electricity are needed in an amount of 1050-1150 kcal/tonne molten glass, depending on capacity utilisation. 7-8% of this is electrical energy. The figures are valid for the mix of 50% broken glass and 50% virgin raw material. A 2% energy saving is achieved per 10% broken glass added.</p> <p>Irrespective of the amount of broken glass added, LPG is also used, plus electricity in general for fans, conveyor belts etc.</p> <p>Carbon dioxide emissions are caused by the burning of oil and gas and by the release of gas from the melt. CO2 emissions in the form of melting losses amounts to approx. 170 g CO2/kg virgin raw material. The carbon dioxide emissions are also dependent on the proportion of broken glass added, because the consumption of fuel varies according to this amount.</p>
<b>Notes</b>	

## SPINE LCI dataset: Glulam wood production

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1997-05-01
<i>Copyright</i>	
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Glulam wood production
<i>Functional Unit</i>	kg
<i>Functional Unit Explanation</i>	1 kg of glulam wood
<i>Process Type</i>	Cradle to gate
<i>Site</i>	Sweden
<i>Sector</i>	Materials and components
<i>Owner</i>	Sweden
<i>Technical system description</i>	This set of data includes Chemical industry, Glue factory, Forestry, Sawmill and Glulam factory (Hot pressing technique, High frequency gluing).

System Boundaries	
<i>Nature Boundary</i>	Extraction of chemicals used in the glue production is not included, but for the ones used to produce the packages.
<i>Time Boundary</i>	
<i>Geographical Boundary</i>	Sweden
<i>Other Boundaries</i>	
<i>Allocations</i>	
<i>Systems Expansions</i>	

Flow Data	
General Activity QMetadata	
<i>Date Conceived</i>	
<i>Data Type</i>	Unspecified
<i>Represents</i>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<i>Method</i>	The average values are calculated from the environmental declarations of three Swedish production plants: Martinson Trä KB, Moelven Töreboda Limträ AB, Långshytte Trävaru AB (Trätek:1, 1996), (Trätek:2,1996), (Trätek:3,1996). The environmental declarations was preformed by Trätek, Stockholm.
<i>Literature Reference</i>	Trätek:1, 1996: Miljövarudeklaration nr 9608063, Limträ, Trätek, Stockholm, 1996 Trätek:2, 1996: Miljövarudeklaration nr 9608064, Limträ, Trätek, Stockholm, 1996 Trätek:3, 1996: Miljövarudeklaration nr 9608065, Limträ, Trätek, Stockholm, 1996 Methodology for Environmental Assessment of Wood Based Products, Version 2, Trätek (The Swedish Institute for Wood Technology Research), I Report, Stockholm, February, 1996
<i>Notes</i>	The data is collected during the spring 1997 but the sources are probably a year or a few years older. The data type unspecified implies that one do not know what the data is based on.

## SPINE LCI dataset: Greece, electricity generation mix 1998

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2001-01-31
<b>Copyright</b>	IEA
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Greece, electricity generation mix 1998
<b>Functional Unit</b>	Total electricity produced during 1998
<b>Functional Unit Explanation</b>	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
<b>Process Type</b>	Unit operation
<b>Site</b>	Greece
<b>Sector</b>	Energyware
<b>Owner</b>	Greece
<b>Technical system description</b>	The generation of electricity with different power generating systems in Greece during the year 1998.

System Boundaries	
<b>Nature Boundary</b>	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
<b>Time Boundary</b>	The data refer to 1998.

<b>Geographical Boundary</b>	Only electricity produced in Australia is considered. Import or export of electricity is not included.
<b>Other Boundaries</b>	-
<b>Allocations</b>	Not applicable
<b>Systems Expansions</b>	Not applicable

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1998

## SPINE LCI dataset: Grinding of bearing rollers

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Grinding of bearing rollers
<b>Functional Unit</b>	One ground bearing roller: 9,2 kg
<b>Functional Unit Explanation</b>	<p>One spherical roller bearing 232/530 consists of following components:</p> <ol style="list-style-type: none"> <li>1. one inner ring</li> <li>2. one outer ring</li> <li>3. one guide ring</li> <li>4. one brass cage</li> <li>5. 36 bearing rollers (coated or non-coated)</li> </ol> <p>For the manufacturing of one bearing roller, one ground bearing roller is needed. The ground roller weighs 9,2 kg.</p>
<b>Process Type</b>	Unit operation
<b>Site</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Sector</b>	Materials and components
<b>Owner</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Technical system description</b>	<p>This activity is a subactivity of the system: "Production of bearing rollers (à 9,2 kg)"</p> <p>After the heat treatment the rollers are transported back to the E-factory and all sides of the rollers are ground and hand polished.</p> <p>This dataset includes the energy consumption for the grinding process of bearing rollers.</p> <p>The scrap from the grinding process is sent to Ovako Steel AB in Hofors by train. These activities are NOT included in this study, but in the complete data system: "Production of bearing rollers à 9,2 kg)".</p> <p>When the rollers have been hand polished they are ready for assembling and are mounted into the SKF spherical roller bearing 232/530.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Emissions to air are not measured and could therefore not be reported in this study. Emissions to water and the use of cutting fluid at SKF, Göteborg, could according to allocation difficulties and lack of time not be calculated.</p> <p>The steel scrap from the grinding process at SKF, Göteborg, is sent to Ovako Steel in Hofors for recycling and is therefore not seen as waste, but a co-product to the technosphere.</p> <p>The grinding plates are not followed from the cradle and not to the grave because of lack of time. The inflow and outflow of grinding plates are therefore ending in the technosphere.</p>
<b>Time Boundary</b>	The data was collected during the autumn 2002, and no changes in the procedure are planned for the nearest future.
<b>Geographical Boundary</b>	The process is site specific for SKF in Göteborg, Sweden.
<b>Other Boundaries</b>	<p>The electricity production is NOT included in this dataset, but must be accounted for to obtain the complete environmental impact.</p> <p>The impact from the production and disposal of the cutting fluid is not included in this dataset, since no data was available.</p> <p>The grinding plates could not be traced back to the cradle, since it was too time consuming.</p>
<b>Allocations</b>	Energy consumption depends on how long the rollers is processed in the different process equipment. This varies according to weight, but also according to size and desired properties of the final product.
<b>Systems Expansions</b>	Not applicable

Flow Data

## SPINE LCI dataset: Grinding of dolomite

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	99-01-25
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Grinding of dolomite
<b>Functional Unit</b>	1 kg ground dolomite
<b>Functional Unit Explanation</b>	
<b>Process Type</b>	Gate to gate
<b>Site</b>	Hydro Agri AB Box 516 SE-261 24 Landskrona Sweden
<b>Sector</b>	Materials and components

<b>Owner</b>	Hydro Agri AB Box 516 SE-261 24 Landskrona Sweden
<b>Technical system description</b>	The grinding takes place at the plant in Landskrona. The supply dolomite has a content of 12,5 % Mg.

## System Boundaries

<b>Nature Boundary</b>	The system only includes grinding of dolomite, i.e production of electricity and extraction of dolomite is not included in this dataset.
<b>Time Boundary</b>	The data are figures for production in 1997.
<b>Geographical Boundary</b>	Hydro Agri AB in Landskrona, Sweden.
<b>Other Boundaries</b>	Emissions and use of resources due to the production of electricity is not included in this dataset.
<b>Allocations</b>	Not applicable.
<b>Systems Expansions</b>	Not applicable.

## Flow Data

### General Activity QMetaData

<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	An average value for emissions of particulates (dust) to air were given in mg/h and the assumed yearly operating time was 3000 h/year. Total emissions per year were then calculated and divided by total amounts of dolomite ground in 1997. Example: (35 400 mg particulates/h) * (3000 h/yr) / (34 000 ton dolomite/yr) = 3.12 g particulates/t dolomite Total amount of electricity consumed was divided by total amounts of dolomite ground in 1997. See also "Specific QMetaData".
<b>Literature Reference</b>	Miljörapport (official environmental report) 1997, Hydro Agri AB, Box 516, 261 24 Landskrona, Sweden. Personal communication: Ronnie Persson, Hydro Agri AB in Landskrona, tel: +46 418 76100.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

## Flow Table and Specific Meta Data

<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>
Notes: 12,5 % Mg	Input	Refined resource	Dolomite	1			kg	Technosphere	Sweden
Method: Total consumption of electricity (1997) / total amount of ground dolomite produced 1997 = 1560 MWh el. / 34 000 t ground dolomite = 0,4588 MWh/t	Input	Refined resource	Electricity	0.165			MJ	Technosphere	Sweden
Method: An average value for emissions of particulates (dust) to air were given in mg/h and the assumed yearly operating time was 3000 h/year. Total emissions per year were then calculated and divided by total amounts of dolomite ground in 1997. Emissions of particulates occur at two points. 4 mg/Nm <sup>3</sup> * 5900 Nm <sup>3</sup> /h + 2 mg/Nm <sup>3</sup> * 5900 Nm <sup>3</sup> /h = 35 400 mg/h Operation time: 3000 h/year (35 400 mg/h * 3000 h/year) / 34 000 t ground dolomite/year = 3,12 g particulates/t ground dolomite	Output	Emission	Particles	0.0031			g	Air	Sweden
	Output	Product	Dolomite	1			kg	Technosphere	Sweden

## About Inventory

<b>Publication</b>	<p>Davis J, Haglund C (1999). "Life Cycle Inventory (LCI) of Fertiliser Production - Fertiliser Products Used in Sweden and Western Europe". SIK report no. 654. The Swedish Institute for Food and Biotechnology (SIK). Gothenburg, Sweden.</p> <p>-----</p> <p>Data documented by: Jennifer Davis, SIK (The Swedish Institute for Food and Biotechnology).</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>-----</p>
--------------------	--

<b>Intended User</b>	The data are intended to be us
<b>General Purpose</b>	To generate an inventory for emissions and use of resources due to the production of fertilisers used in Sweden.
<b>Detailed Purpose</b>	The purpose was not to compare different fertilisers with each other but to generate a thorough inventory of emissions and use of resources due to the production of different mineral fertilisers used in Sweden. Grinding of dolomite is one process step in the line of production of calcium ammonium nitrate (CAN) produced in Landskrona. The data are intended to constitute a useful basis of input information in life cycle assessments of food production systems.
<b>Commissioner</b>	- SIK AB, The Swedish Institute for Food and Biotechnology Box 5401 SE-402 29 Gothenburg Sweden .
<b>Practitioner</b>	Davis, Jennifer and Caroline Haglund - SIK AB Box 5401 402 29 Gothenburg Sweden.
<b>Reviewer</b>	-
<b>Applicability</b>	The dataset is applicable for data on grinding of dolomite in Sweden. The dolomite is mixed with ammonium nitrate to produce calcium ammonium nitrate (CAN). The dataset is included in the aggregated dataset for production of CAN at Hydro Agri AB in Landskrona (cradle to gate).
<b>About Data</b>	Data is collected from the official environmental report distributed by Hydro Agri AB in Landskrona and also with personal communication with people working there.
<b>Notes</b>	Internal review of the report was performed by: Olle Ramnäs, CTH (Chalmers University of Technology), Berit Mattsson and Magnus Stadig, SIK (The Swedish Institute for Food and Biotechnology).

## SPINE LCI dataset: Handpolishing of bearing rollers

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Handpolishing of bearing rollers
<b>Functional Unit</b>	One bearing roller: 9,2 kg
<b>Functional Unit Explanation</b>	<p>One spherical roller bearing 232/530 consists of following components:</p> <ol style="list-style-type: none"> <li>1. one inner ring</li> <li>2. one outer ring</li> <li>3. one guide ring</li> <li>4. one brass cage</li> <li>5. 36 rollers (coated or non-coated)</li> </ol> <p>The functional unit for this process is one bearing roller. Note however that the data only represent the last handpolishing step in the manufacturing process. For the complete system see the activity "Production of bearing rollers (à 9,2 kg)" in SPINE@CPM database.</p>
<b>Process Type</b>	Unit operation
<b>Site</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Sector</b>	Materials and components
<b>Owner</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Technical system description</b>	<p>This activity is a process step included in the system: "Production of bearing rollers (à 9,2 kg)" (can be found in the SPINE@CPM database)</p> <p>This activity represents the last process step for the manufacturing of bearing rollers at SKF's site in Göteborg, Sweden. The rollers are being polished by hand in order to get a smooth surface.</p>

	<p>The dataset include energy consumption for hand polishing and the amount of grinding paper used.</p> <p>The grinding paper used is bought from Slipnaxos AB in Västervik, where the production of the grinding paper takes place. The production of grinding paper could be approximated with the activity "Production of Kraftliner" from SPINE@CPM database. Neither Production of Kraftliner nor the transport from Västervik to Göteborg are included in this dataset, but the Production of Kraftliner is included though in the complete data system: "Production of bearing rollers (à 9,2 kg)"</p> <p>When the rollers have been hand polished they are ready for assembling and are mounted into the SKF spherical roller bearing 232/530.</p>
--	--

System Boundaries	
<b>Nature Boundary</b>	Emissions to air are not measured and could therefore not be reported in this study. Emissions to water and the use of cutting fluid at SKF, Göteborg, could according to allocation difficulties and lack of time not be calculated.
<b>Time Boundary</b>	The data was collected during the autumn 2002.
<b>Geographical Boundary</b>	The process is site specific for SKF in Göteborg, Sweden.
<b>Other Boundaries</b>	<p>The electricity production is NOT included in this dataset, but must be accounted for to get the complete environmental impact.</p> <p>The impact from the production and disposal of the cutting fluid is not included in this dataset, since no data was available.</p> <p>The grinding paper is not followed from the cradle but must be taken into account for the complete environmental impact. The production of grinding paper could be approximated with the activity "Production of Kraftliner" from SPINE@CPM database.</p>
<b>Allocations</b>	Energy consumption depends on how long the rollers is processed in the different process equipment. This varies according to weight, but also according to size and desired properties of the final product.
<b>Systems Expansions</b>	Not applicable

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	02-08-01 - 02-12-31
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	Data is gathered from interviews with Niclas Thim, SKF Large Bearings, Sweden.

## SPINE LCI dataset: Heating of ingot at the rolling mill

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Heating of ingot at the rolling mill
<b>Functional Unit</b>	One ton of heated ingot
<b>Functional Unit Explanation</b>	The heated ingot will be further processed into bearing rings, used in SKF spherical roller bearing 232/530.
<b>Process Type</b>	Unit operation
<b>Site</b>	Ovako Steel AB SE-813 82 Hofors
<b>Sector</b>	Materials and components
<b>Owner</b>	Ovako Steel AB SE-813 82 Hofors
<b>Technical system description</b>	<p>This activity is a process step in the whole system "Production of bearing rings", this activity is available in the SPINE@CPM database.</p> <p>Heating of ingot at the rolling mill:  At the rolling mill at Ovako Steel in Hofors the ingots are rolled into billets. The ingots are first heated in a soaking pit to the proper rolling temperature. When the ingot has been rolled in the first stand of rolls it is transported to the oxygen-scarfing machine where surface defects are removed from the billet. The billet rolling is then continued in rolling stand 2 and 3. Depending on what will become of the ingot it is rolled to round or square billets. Finally the billets are inspected and surface defects, if any, are removed by grinding.</p> <p>IN this specific case the ingot is only heated in the soaking pit at the rolling mill. Instead of rolling in the rolling stands the ingot is transported to Scana Steel AB in Söderfors for forging into bars. (the transport from Hofors to Söderfors is NOT included in this dataset)</p>

System Boundaries	
<b>Nature Boundary</b>	Emission to air and water are included. Emissions to soil are not known. The water recipient is Hoån, Sweden.
<b>Time Boundary</b>	All data refers to year 1999. No changes are planned for the nearest future.
<b>Geographical Boundary</b>	The rolling mill is located at Ovako Steel AB in Hofors, Sweden.

<b>Other Boundaries</b>	Production of light and heavy fuel oil is NOT included but must be followed from the cradle. Production of LPG is not included but must be followed from the cradle. No transport is included.
<b>Allocations</b>	Allocation have been made according to weight.
<b>Systems Expansions</b>	Not applicable

## SPINE LCI dataset: Heating of smelt iron in a holding furnace

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Heating of smelt iron in a holding furnace
<b>Functional Unit</b>	6,59 kg heated smelt iron
<b>Functional Unit Explanation</b>	6,59 kg smelt iron is used to produce one bearing housing, SNL 511-609, at SKF Mekan AB in Katrineholm. This activity is also included in the production of guide rings. The dataset is used unchanged for our specific case, and thus the functional unit is 6,59 kg smelt iron. The figure 6,59 has nothing to do with guide rings as such.
<b>Process Type</b>	Unit operation
<b>Site</b>	SKF Mekan ABBBox 89 641 21 Katrineholm
<b>Sector</b>	Materials and components
<b>Owner</b>	SKF Mekan ABBBox 89 641 21 Katrineholm
<b>Technical system description</b>	This activity describes a process step included in the system "Production of guide rings used for spherical roller bearings", also available in the SPINE@CPM database.  The guide ring is manufactured at SKF Mekan AB in Katrineholm and the process consists of several steps. (See the activity "Production of guide rings used for spherical roller bearings" for details.) The guide ring will finally be mounted into the SKF Spherical Roller Bearing 232/530. The function of the guide ring is to assure that the rollers stay in the raceways of the bearing.

	<p>After the smelting process, the smelt is transported in a ladle to the holding furnace to keep it heated.</p> <p>This activity describes the energy consumption for the heating of the smelt iron in the holding furnace.</p> <p>The production of electricity is NOT included in this dataset, but must be followed from the cradle in order to obtain the total environmental impact.</p> <p>Data is taken from an earlier LCA study of the bearing housing SNL 511-609: Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmar University; August 2002.</p>
--	--

System Boundaries	
<b>Nature Boundary</b>	No emissions to air and water are known. The dataset is only describing the electricity consumption for the furnace.
<b>Time Boundary</b>	The data was collected during the autumn 2002 and no changes in the procedure are planned for the nearest future.
<b>Geographical Boundary</b>	The process takes place at SKF Mekan AB in Katrineholm, Sweden
<b>Other Boundaries</b>	The production of electricity is NOT included in this dataset, but must be followed from the cradle in order to obtain the total environmental impact.
<b>Allocations</b>	Allocations were made according to weight

## SPINE LCI dataset: Heavy truck with international semitrailer, max 40 tonnes, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck with international semitrailer, max 40 tonnes, future
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with international semitrailer with engine representing best available technology (proposed Euro 3 environmental standard) with oxidation filter and catalytic control. The towcar for the equipage is a truck, max 24 tonnes. The equipage is new and not frequently used in Swedish domestic traffic.</p> <p>Maximum gross weight: 40 tonnes.</p> <p>Kerb weight: 22 tonnes.</p> <p>Available loading capacity with regard to weight: 18 tonnes.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents best available technology, not yet in regular use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul>

	<i>Excluded subsystems</i> -Exhaust emission control -Precombustion, i.e. production and distribution of the fuel -Maintenance of the vehicle -Erection and operation of infrastructure -After-treatment of the vehicle -Handling of production rests
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	The emissions were calculated using emission factors obtained by the a new test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level. See specific QMetaData for each flow.
<b>Literature Reference</b>	Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmars University; August 2002.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

<b>Flow Table and Specific Meta Data</b>									
<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>
	Input	Cargo	Cargo	1			tonne	Technosphere	
Date conceived: 1997-01-01 Data type: Unspecified, expert outspoke Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> <i>Assumptions given by the Swedish Road Haulage Association:</i> -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm	Input	Refined resource	Diesel environmental class 1	1.01			MJ	Technosphere	
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NOx	Output	Emission	CO	0.012			g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> <i>Assumptions given by the Swedish Road Haulage Association:</i> -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information	Output	Emission	CO2	74			g	Air	
Method: See QMetaData for NOx	Output	Emission	HC	0.012			g	Air	

<p>Date conceived: 1996-01-01</p> <p>Data type: Derived, unspecified</p> <p>Method: The emissions per tonkm were calculated using emission factors (g/kWh) obtained by a new test cycle, on the engine, where kWh refers to mechanical work done by the engine. The tests were performed by Motortestcenter. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)]/l)*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)]/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,38 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1:</i> Thermal value: 43,43 MJ/kg Density: 0,81 kg/l Sulphur content: 10 ppm The data were supplied by the Swedish Petroleum Institute <i>The emission factors were:</i> NOx 6,3 g/kWh HC 0,4 g/kWh CO 0,7 g/kWh Particles 0,11 g/kWh Degree of efficiency on the engine: 41 % (assumption). The data can be found in Ahlvik. Literature: Ahlvik P., Almén J., Grägg K., Laveskog A. <i>Avgasemissioner med alternativa bränslen</i> Motortestcenter, februari 1996 (Published in SOU 1996:184 <i>Bilagor till betänkande av alternativbränsleutredningen</i>)</p>	Output	Emission	NOx	0.58			g	Air	
<p>Method: See QMetaData for NOx</p>	Output	Emission	Particles	0.0023			g	Air	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information</p>	Output	Emission	SO2	0.00044			g	Air	

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport</p>

	companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	The ambition with the data was to get a picture of future energy use and emissions. The data represents best available technology not yet in use.
<b>About Data</b>	The data is based on tests on the engine performed in a laboratory according to a new test cycle (proposed for standardisation). This means that several parameters that influence the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport</p>

	<p>companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:  BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegoods) and wholesale (partigods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %</p>

	<p>The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b> The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b> The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, A. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b> The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetadata).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:</p> <p>BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b></p> <p>Road transports generally consists of 1-3 routes:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol> <p>The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt; 1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt; 100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b></p> <p>--<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in</p>

	<p>Finland.  --Truck with semitrailer, max 42 tonnes is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %  The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b>  The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b>  The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b>  The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<p><b>About Data</b></p>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<p><b>Notes</b></p>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage:  <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for</p>

road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.

The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.

The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

## SPINE LCI dataset: Heavy truck with international semitrailer, max 40 tonnes, manufactured between 1992 and 1995[Euro1]

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck with international semitrailer, max 40 tonnes, manufactured between 1992 and 1995[Euro1]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	Operation of a diesel driven heavy truck with international semitrailer with engine manufactured between 1992 and 1995 (Euro 1 environmental standard). The towcar for the equipage is a truck, max 24 tonnes. The equipage is new and not frequently used in Swedish domestic traffic. Maximum gross weight of the equipage: 40 tonnes. Kerb weight: 22 tonnes. Available loading capacity with regard to weight: 18 tonnes.

System Boundaries	
<b>Nature Boundary</b>	Regulated emissions to air are included. The parameters that are presented are: -regulated emissions for diesel engines: NOx, HC, particles and CO -fuel regulated: SO2 -tax regulated CO2.  Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.
<b>Time Boundary</b>	The data represents trucks with engine manufactured between 1992 and 1995
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i> .  <i>Parameters not considered</i> -Driving technique -External conditions i.e. road conditions, climate etc.

	-Maintenance level of the vehicle  <i>Excluded subsystems</i> -Exhaust emission control -Precombustion, i.e. production and distribution of the fuel -Maintenance of the vehicle -Erection and operation of infrastructure -After-treatment of the vehicle -Handling of production rests
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with fuel gas in the UCTPE countries in the early nineties.
<b>Method</b>	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, <i>the maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO <sub>2</sub> and SO <sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i> , the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to the emission regulations for diesel engines according to the emission standard Euro I.
<b>Literature Reference</b>	Rasmus Beckman and Henrik Olsson; Vilken miljöpåverkan uppstår vid tillverkningen av ett lagerhus?; Master Thesis at Kalmar University; August 2002.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere	
Date conceived: 1997-01-01 Data type: Unspecified, expert outspoke Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine	Input	Refined resource	Diesel environmental class 1	1.06	1.05	1.07	MJ	Technosphere	
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NO <sub>x</sub>	Output	Emission	CO	0.12		0.54	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The</b>	Output	Emission	CO <sub>2</sub>	77	77	78	g	Air	

<p><b>following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information</p>								
Method: See QMetaData for NOx	Output	Emission	HC	0.06		0.13 g	Air	
<p>Date conceived: 1997-01-01  Data type: Derived, unspecified  Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refer to emission regulations for diesel engines according to the emission standard Euro I. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)/l]*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/ (loading capacity [tonne]*utilisation level)  <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were:</i> Quantity value, i.e. average engine: -NOx 7,6 g/kWh -HC 0,5 g/kWh -CO 1,0 g/kWh -Particles 0,2 g/kWh -Degree of efficiency on the engine: 40 % (assumed) The data was supplied by the Volvo Truck Corporation <i>Maximum value, i.e. emission standard Euro I for diesel engines:</i> -NOx 8 g/kWh -HC 1,1 g/kWh -CO 4,5 g/kWh -Particles 0,36 g/kWh -Degree of efficiency on the engine: 40 % (assumed) No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.</p>	Output	Emission	NOx	0.9		0.95 g	Air	

Method: See QMetaData for NOx	Output	Emission	Particles	0.022			g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,38 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information	Output	Emission	SO2	0.00049	0.00048	0.0005	g	Air

The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1998 - 08
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NOx 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ## About Inventory

### Publication

www.ntm.a.se

Data documented by: Magnus Blinge, Dept. for Transportation & Logistics, Chalmers University of Technology

Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.

The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation

### Detailed Purpose

The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)

The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NTM.

### Practitioner

- Swedish haulages and transport companies .

### Reviewer

None, to be reviewed. -

### Applicability

The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.

Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.

The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetadata for emission factors that can be used to calculate emissions per litre fuel used.

The age categories of the vehicles compiled in the work are:

Older than 1990,

Euro 0: Introduced 1987, law from 1990

Euro 1: Introduced 1991, law from 1993

Euro 2: Introduced 1993, law from 1996

However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.

### **Handling of goods**

The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)

Terminal based road transports generally consists of 1-3 parts:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.

--*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (<100 kg)* are normally handled in small vehicles

### **The following vehicles and equipages are used in terminal based transport systems in Sweden:**

--*Parcel truck/van, max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport*. The vehicle is also permitted in Finland.

--*Truck with semi-trailer, max 42 tonnes* is used for international long-distance traffic.

### **Utilisation level**

The data is only applicable for an utilisation level of 70 % which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

### **Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

### **Fuel**

The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (> 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NO<sub>x</sub> emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.

### **International road transports**

The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SO<sub>x</sub> emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.

### **About Data**

The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.

<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1998 - 08
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i>, The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under</p>

	actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NOx 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ## About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	- Swedish haulages and transport companies .

<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.</p> <p>The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetadata for emission factors that can be used to calculate emissions per litre fuel used.</p> <p>The age categories of the vehicles compiled in the work are:  Older than 1990,  Euro 0: Introduced 1987, law from 1990  Euro 1: Introduced 1991, law from 1993  Euro 2: Introduced 1993, law from 1996  However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.</p> <p><b>Handling of goods</b></p> <p>The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)</p> <p>Terminal based road transports generally consists of 1-3 parts:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol> <p>The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b></p> <p>--<i>Parcel truck/van, max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.</p> <p>--<i>Truck with semi-trailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b></p> <p>The data is only applicable for an utilisation level of 70 % which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally</p>

	<p>accepted in the transportation business.</p> <p><b>Fuel</b> The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b> The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.

The age categories of the vehicles compiled in the work are:

Older than 1990,

Euro 0: Introduced 1987, law from 1990

Euro 1: Introduced 1991, law from 1993

Euro 2: Introduced 1993, law from 1996

However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.

### **Handling of goods**

The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)

Terminal based road transports generally consists of 1-3 parts:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.

--*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (<100 kg)* are normally handled in small vehicles

### **The following vehicles and equipages are used in terminal based transport systems in Sweden:**

--*Parcel truck/van, max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport*. The vehicle is also permitted in Finland.

--*Truck with semi-trailer, max 42 tonnes* is used for international long-distance traffic.

### **Utilisation level**

The data is only applicable for an utilisation level of 70 % which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

### **Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

### **Fuel**

The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (> 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.

	<p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.</p>
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

## SPINE LCI dataset: Heavy truck with trailer, max 60 tonnes, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck with trailer, max 60 tonnes, future
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with international semitrailer with engine representing best available technology (proposed Euro 3 environmental standard) with oxidation filter and catalytic control. The towcar for the equipage is a truck, max 24 tonnes. The equipage is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The equipage is also permitted in Finland.</p> <p>Maximum gross weight: 60 tonnes.  Kerb weight: 20 tonnes.  Available loading capacity with regard to weight: 40 tonnes.  Length 24 metres.</p>

## System Boundaries

<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents best available technology, not yet in regular use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by a new test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level. See specific QMetaData for each flow.
<b>Literature Reference</b>	
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

<b>Flow Table and Specific Meta Data</b>

<b>About Inventory</b>	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	The ambition with the data was to get a picture of future energy use and emissions. The data represents best available technology, not yet in use.
<b>About Data</b>	The data is based on tests on the engine performed in a laboratory according to a new test cycle (proposed for standardisation). This means that several parameters that influence the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

SPINE LCI dataset: Heavy truck with trailer, max 60 tonnes, manufactured after 1996 [Euro 2]

Flow Data	
General Activity QMetaData	

<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i> , the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation, the <i>maximum value</i> refer to an engine run 500 000 km. No minimum value was given.
<b>Literature Reference</b>	
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b></p> <p>Road transports generally consists of 1-3 routes:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol>

	<p>The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt; 1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt; 100 kg)</i> are normally handled in small vehicles</p> <p><b><i>The following vehicles and equipages are used for transportation in Sweden:</i></b></p> <p>--<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.</p> <p>--<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b><i>Utilisation level</i></b></p> <p>The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b><i>The Swedish fleet</i></b></p> <p>The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:</p> <p>After 1996: 10 %  95-92: 33%  Before 1992 52 %</p> <p>The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b><i>Bulky goods</i></b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b><i>Fuel</i></b></p> <p>The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b><i>International road transports</i></b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle</p>

	<p>that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Heavy truck with trailer, max 60 tonnes, manufactured before 1992 [Euro 0]

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck with trailer, max 60 tonnes, manufactured before 1992 [Euro 0]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with trailer with engine manufactured before 1992 (Euro 0 environmental standard). The towcar for the equipage is a truck, max 24 tonnes. The equipage is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The equipage is also permitted in Finland.</p> <p>Maximum gross weight: 60 tonnes. Kerb weight: 20 tonnes. Available loading capacity with regard to weight: 40 tonnes. Length 24 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured before 1992
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to voluntary European emission regulations for diesel engines before 1992.</p>
<b>Literature Reference</b>	
<b>Notes</b>	<p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.</p>

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,45 l/km.</p>	Input	Refined resource	Diesel environmental class 1	0.57	0.56	0.57	MJ	Technosphere	

-Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine									
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NOx.	Output	Emission	CO	0.09		0.74	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,45 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information	Output	Emission	CO2	41	41	42	g	Air	
Method: See QMetaData for NOx.	Output	Emission	HC	0.09		0.15	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refer to voluntary European emission regulations for diesel engines before 1992. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)]/l)*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)]/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,45 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were: Quantity value, i.e. average engine::</i> -NOx 11 g/kWh -HC 1,5 g/kWh -CO 1,5 g/kWh -Particles 0,4 g/kWh (estimated) -Degree of efficiency on the engine: 39 % (assumed) The data was supplied by the Volvo Truck Corporation. <i>Maximum value, i.e.</i>	Output	Emission	NOx	0.67	0.55	0.87	g	Air	

<p><i>voluntary European emission regulations: -NOx 14 g/kWh -HC 2,5 g/kWh -CO 12 g/kWh -Particles - g/kWh (not given) -Degree of efficiency on the engine: 39 %. No minimum value was given. The ECE R49 is a steady state cycle for heavy duty truck engines. Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.</i></p>									
Method: See QMetaData for NOx.	Output	Emission	Particles	0.024			g	Air	
<p>Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,45 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information</p>	Output	Emission	SO2	0.00026	0.00026	0.00027	g	Air	

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use</p>

	today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipment is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for <i>Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %  The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b>  The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b>  The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p>

	<p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>

<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetadata for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, <i>the maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to the emission regulations for diesel engines according to the emission standard Euro I.</p>
<b>Literature Reference</b>	
<b>Notes</b>	<p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.</p>

Flow Table and Specific Meta Data

## About Inventory

### Publication

*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997*

-----  
Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM

### Intended User

Suppliers and buyers of goods

<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b> Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b> --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels. --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic. --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic. --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods. --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for <i>Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland. --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b> The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden): -excavated materials and round timber - 50% -manufactured products (wholesale goods) - slightly more than 20% -provisions and animal forage - approx. 15%</p>

	<p>-mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %  The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b>  The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b>  The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b>  The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<p><b>About Data</b></p>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<p><b>Notes</b></p>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

# SPINE LCI dataset: Heavy truck with two trailers, long distance, Euro 0

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1998 - 08
<b>Copyright</b>	NTM
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Heavy truck with two trailers, long distance, Euro 0
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is considered to be representative for Swedish domestic long-distance traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of heavy truck with two trailers for long distance transports, approximately 24 m long with a curb weight of 60 tons and a maximum load of 40 tons.</p> <p>Fuel: diesel, MK 1 (sulphurous content: 2 ppm).</p> <p>Fuel consumption: high 5,5 l/10 km, medium 4,9 l/10 km, low 4,3 l/10 km.</p> <p>Engine type: Euro 0 (1987-1992).</p> <p>Utilisation level: 70% by weight.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	Data are valid for trucks produced 1987 - 1992
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1998 - 08

<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m <sup>3</sup> . Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO <sub>2</sub> and SO <sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i> , The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NO <sub>x</sub> 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ### About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:</p> <p>BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>

<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	- Swedish haulages and transport companies .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.</p> <p>The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.</p> <p>The age categories of the vehicles compiled in the work are:  Older than 1990,  Euro 0: Introduced 1987, law from 1990  Euro 1: Introduced 1991, law from 1993  Euro 2: Introduced 1993, law from 1996  However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.</p> <p><b>Handling of goods</b></p> <p>The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)</p> <p>Terminal based road transports generally consists of 1-3 parts:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal</p> <p>The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--Wholesale goods (&gt;1000 kg) are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --General goods (100-1000 kg) are generally handled via terminal. The goods may be both weight and volume limited  --Parcel goods (&lt;100 kg) are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b>  --Parcel truck/van, max 3,5 tonnes is mainly used for transportation of parcels.  --Light truck, max 8 tonnes is used for local distribution, mainly in city traffic.  --Truck, max 18 tonnes is used for district distribution and local distribution in city traffic.  --Truck, max 24 tonnes is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.  --Heavy truck with trailer, max 60 tonnes is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.  --Truck with semi-trailer, max 42 tonnes is used for international long-distance traffic.</p> <p><b>Utilisation level</b></p> <p>The data is only applicable for an utilisation level of 70 % which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally</p>

	<p>have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonyhydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SO<sub>x</sub> emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.</p>
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1998 - 08
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i>, The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under</p>

	<p>actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NOx 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ## About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	- Swedish haulages and transport companies .

<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.</p> <p>The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetadata for emission factors that can be used to calculate emissions per litre fuel used.</p> <p>The age categories of the vehicles compiled in the work are:  Older than 1990,  Euro 0: Introduced 1987, law from 1990  Euro 1: Introduced 1991, law from 1993  Euro 2: Introduced 1993, law from 1996  However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.</p> <p><b>Handling of goods</b></p> <p>The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)</p> <p>Terminal based road transports generally consists of 1-3 parts:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol> <p>The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b></p> <p>--<i>Parcel truck/van, max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.</p> <p>--<i>Truck with semi-trailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b></p> <p>The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent</p>

	<p>weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SO<sub>x</sub> emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.</p>
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.

The age categories of the vehicles compiled in the work are:

Older than 1990,

Euro 0: Introduced 1987, law from 1990

Euro 1: Introduced 1991, law from 1993

Euro 2: Introduced 1993, law from 1996

However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.

### **Handling of goods**

The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)

Terminal based road transports generally consists of 1-3 parts:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.

--*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (<100 kg)* are normally handled in small vehicles

### **The following vehicles and equipages are used in terminal based transport systems in Sweden:**

--*Parcel truck/van, max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport*. The vehicle is also permitted in Finland.

--*Truck with semi-trailer, max 42 tonnes* is used for international long-distance traffic.

### **Utilisation level**

The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

### **Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

### **Fuel**

The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (> 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based

	on best available technology and Swedish conditions which is likely to yield a low figure.
	<p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The calculations of data on heavy trucks are based on the fuel consumption of the vehicle. The fuel consumption data have been obtained by simulations of heavy vehicles in traffic under Swedish conditions. These simulations were made by Volvo Trucks and Scania, especially for NTM. The data on emissions are based on measurements in accordance with applicable standards for certification.
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1998 - 08
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i>, The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NO<sub>x</sub> 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. (Payl. 40 ton) 28-33 43-55</p>
<b>Literature Reference</b>	
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

## About Inventory

### Publication

www.ntm.a.se

Data documented by: Magnus Blinge, Dept. for Transportation & Logistics, Chalmers University of Technology

Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.

The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation

### Detailed Purpose

The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)

The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NTM.

### Practitioner

- Swedish haulages and transport companies .

### Reviewer

None, to be reviewed. -

### Applicability

The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.

Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.

The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetadata for emission factors that can be used to calculate emissions per litre fuel used.

The age categories of the vehicles compiled in the work are:

Older than 1990,

Euro 0: Introduced 1987, law from 1990

Euro 1: Introduced 1991, law from 1993

Euro 2: Introduced 1993, law from 1996

However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.

#### Handling of goods

The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil

	<p>and excavated materials)</p> <p>Terminal based road transports generally consists of 1-3 parts:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol> <p>The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b></p> <p>--<i>Parcel truck/van, max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.</p> <p>--<i>Truck with semi-trailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b></p> <p>The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. ### Intended User

Suppliers and buyers of goods

<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

<b>Reviewer</b>	
<b>Applicability</b>	The ambition with the data was to get a picture of future energy use and emissions. The data represents best available technology, not yet in use.
<b>About Data</b>	The data is based on tests on the engine performed in a laboratory according to a new test cycle (proposed for standardisation). This means that several parameters that influence the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck, max 18 tonnes, manufactured after 1996 [Euro 2]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven truck with engine manufactured after 1996 (Euro 2 environmental standard). The vehicle is mainly used for district distribution and local distribution in city traffic.</p> <p>Maximum gross weight: 18 tonnes.  Kerb weight: 9,5 tonnes.  Available loading capacity with regard to weight: 8 tonnes.  Length 9 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured after 1996
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, <i>the maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation, the <i>maximum value</i> refer to an engine run 500 000 km. No minimum value was given.</p>
<b>Literature Reference</b>	

**Notes**

Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

**Flow Table and Specific Meta Data**

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,35 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine</p>	Input	Refined resource	Diesel environmental class 1	2.2	2.17	2.23	MJ	Technosphere	
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NOx.	Output	Emission	CO	0.18		0.21	g	Air	
<p>Date conceived: 1997-01-01</p> <p>Data type: Derived, unspecified</p> <p>Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,35 l/km.r&gt; -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information</p>	Output	Emission	CO2	161	158	163	g	Air

Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997

-----  
Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM  
-----

<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b> Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b> --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels. --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic. --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic. --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegoods) and wholesale (partigoods) goods. --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for <i>Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland. --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b> The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p>

	<p>-excavated materials and round timber - 50%</p> <p>-manufactured products (wholesale goods) - slightly more than 20%</p> <p>-provisions and animal forage - approx. 15%</p> <p>-mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b></p> <p>The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:</p> <p>After 1996: 10 %</p> <p>95-92: 33%</p> <p>Before 1992 52 %</p> <p>The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,35 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetadata for the Diesel flow for further	Output	Emission	CO2	161	159	162	g	Air	

information									
Method: See QMetaData for NOx.	Output	Emission	HC	0.36			0.6 g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refer to voluntary European emission regulations for diesel engines before 1992. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)]/[kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,35 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were: Quantity value, i.e. average engine::</i> -NOx 11 g/kWh -HC 1,5 g/kWh -CO 1,5 g/kWh -Particles 0,4 g/kWh (estimated) -Degree of efficiency on the engine: 39 % (assumed) The data was supplied by the Volvo Truck Corporation. <i>Maximum value, i.e. voluntary European emission regulations:</i> -NOx 14 g/kWh -HC 2,5 g/kWh -CO 12 g/kWh -Particles - g/kWh (not given) -Degree of efficiency on the engine: 39 %. No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.	Output	Emission	NOx	2.6	2.1	3.4 g	Air		
Method: See QMetaData for NOx.	Output	Emission	Particles	0.095			g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,35 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to	Output	Emission	SO2	0.00101	0.001	0.00104	g	Air	

weight. Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:  
 -Thermal value: 43,43 MJ/kg  
 -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information

## About Inventory

### Publication

*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997*

-----  
 Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM  
 -----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:  
 BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

### Detailed Purpose

The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

### Practitioner

Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .

### Reviewer

### Applicability

The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

#### Handling of goods

Road transports generally consists of 1-3 routes:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles

--*Wholesale goods (> 1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (< 100 kg)* are normally handled in small vehicles

#### The following vehicles and equipages are used for transportation in Sweden:

--*Truck max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (stykke gods) and

wholesale (partigods) goods.

--Heavy truck with trailer, max 60 tonnes is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.

--Truck with semitrailer, max 42 tonnes is used for international long-distance traffic.

**Utilisation level**

The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

**The Swedish fleet**

The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:

After 1996: 10 %  
 95-92: 33%  
 Before 1992 52 %

The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.

**Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

**Fuel**

The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.

**International road transports**

The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.

## About Data

Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.

Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.

The data on emissions is largely based on tests on the engine performed in a laboratory according to a *standardised test cycle*. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.

A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.

The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).

<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Heavy truck, max 18 tonnes, manufactured between 1992 and 1995 [Euro1]

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck, max 18 tonnes, manufactured between 1992 and 1995 [Euro1]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven truck with engine manufactured between 1992 and 1995 (Euro 1 environmental standard). The vehicle is mainly used for district distribution and local distribution in city traffic.</p> <p>Maximum gross weight: 18 tonnes.  Kerb weight: 9,5 tonnes.  Available loading capacity with regard to weight: 8 tonnes.  Length 9 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured between 1992 and 1995

<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, <i>the maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to the emission regulations for diesel engines according to the emission standard Euro I.</p>
<b>Literature Reference</b>	
<b>Notes</b>	<p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.</p>

## Applicability

The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

### Handling of goods

Road transports generally consists of 1-3 routes:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles

--*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (<100 kg)* are normally handled in small vehicles

### The following vehicles and equipages are used for transportation in Sweden:

--*Truck max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.

--*Truck with semitrailer, max 42 tonnes* is used for international long-distance traffic.

### Utilisation level

The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

-excavated materials and round timber - 50%

-manufactured products (wholesale goods) - slightly more than 20%

-provisions and animal forage - approx. 15%

-mixed cargo (general goods) approx - 10 %.

### The Swedish fleet

The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:

After 1996: 10 %

95-92: 33%

Before 1992 52 %

The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.

### Bulky goods

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

### Fuel

The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.

### International road transports

The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.

<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Heavy truck, max 24 tonnes, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck, max 24 tonnes, future
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden

<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with engine representing best available technology (proposed Euro 3 environmental standard) with oxidation filter and catalytic control. The vehicle is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>Maximum gross weight: 24 tonnes.</p> <p>Kerb weight: 10 tonnes.</p> <p>Available loading capacity with regard to weight: 14 tonnes.</p> <p>Length 24 metres.</p>
-------------------------------------	---

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents best available technology, not yet in regular use.
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by a new test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level. See specific QMetaData for each flow.
<b>Literature Reference</b>	
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b></p>	Input	Refined resource	Diesel environmental class 1	1.27			MJ	Technosphere	

<p><i>Assumptions given by the Swedish Road Haulage Association:</i> -Average fuel consumption: 0,37 l/km.          -Utilisation level: 70 %, of the available loading capacity with regard to weight.  <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l          -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine          -maximum value: 1,01 in relation to the average engine</p>								
	Output	Cargo	Cargo	1			tonne	Technosphere
Method: See QMetaData for NOx	Output	Emission	CO	0.014			g	Air
<p>Date conceived: 1997-01-01          Data type: Derived, unspecified          Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel.  <b>The following data was used in the calculations:</b> <i>Assumptions given by the Swedish Road Haulage Association:</i>          -Average fuel consumption 0,37 l/km.          -Utilisation level: 70 %, of the available loading capacity with regard to weight.  <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg          -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel          See QMetaData for the Diesel flow for further information</p>	Output	Emission	CO2	93			g	Air
Method: See QMetaData for NOx	Output	Emission	HC	0.014			g	Air
<p>Date conceived: 1996-01-01          Data type: Derived, unspecified          Method: The emissions per tonkm were calculated using emission factors (g/kWh) obtained by a new test cycle, on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The tests was performed by Motortestcenter. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)]/l)*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)]/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> <i>Assumptions given by the Swedish Road Haulage Association:</i>          -Average fuel consumption 0,37 l/km          -Utilisation level: 70 %, of the available loading capacity with regard to weight.  <i>Data for the fuel, diesel environmental class 1:</i> Thermal value: 43,43 MJ/kg          Density: 0,81 kg/l Sulphur content: 10 ppm The data were supplied by the Swedish Petroleum Institute <i>The emission factors were:</i> -NOx 6,3 g/kWh          -HC 0,4 g/kWh -CO 0,7 g/kWh          -Particles 0,11 g/kWh -Degree of efficiency on the engine: 41 % (assumption). The data can be found in Ahlvik.          Literature: Ahlvik P., Almén J., Grägg K., Laveskog A. <i>Avgasemissioner med alternativa bränslen</i> Motortestcenter, februari 1996 (Published in SOU 1996:184 <i>Bilagor till betänkande av alternativbränsleutredningen</i>)</p>	Output	Emission	NOx	0.72			g	Air
Method: See QMetaData for NOx	Output	Emission	Particles	0.0029			g	Air
<p>Date conceived: 1997-01-01          Data type: Derived, unspecified          Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel  <b>The following data was used in the</b></p>	Output	Emission	SO2	0.00056			g	Air

**calculations:** Assumptions given by the Swedish Road Haulage Association:  
 -Average fuel consumption 0,37 l/km.  
 -Utilisation level: 70 %, of the available loading capacity with regard to weight.  
 Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute: -Thermal value: 43,43 MJ/kg  
 -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information

## About Inventory

### Publication

*Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997*

-----  
 Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM  
 -----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:  
 BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

### Detailed Purpose

The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

### Practitioner

Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .

### Reviewer

### Applicability

The ambition with the data was to get a picture of future energy use and emissions. The data represents best available technology, not yet in use.

### About Data

The data is based on tests on the engine performed in a laboratory according to a new test cycle (proposed for standardisation). This means that several parameters that influence the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.

### Notes

The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage:  
<http://www.ntm.a.se>.

The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.

The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different

transportation alternatives.

The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

## SPINE LCI dataset: Heavy truck, max 24 tonnes, manufactured after 1996 [Euro 2]

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck, max 24 tonnes, manufactured after 1996 [Euro 2]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with engine manufactured after 1996 (Euro 2 environmental standard). The vehicle is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>Maximum gross weight: 24 tonnes.  Kerb weight: 10 tonnes.  Available loading capacity with regard to weight: 14 tonnes.  Length 24 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:  - regulated emissions for diesel engines: NOx, HC, particles and CO  - fuel regulated: SO2  - tax regulated CO2.</p> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured after 1996
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i>  - Driving technique  - External conditions i.e. road conditions, climate etc.  - Maintenance level of the vehicle</p> <p><i>Excluded subsystems</i>  - Exhaust emission control  - Precombustion, i.e. production and distribution of the fuel  - Maintenance of the vehicle  - Erection and operation of infrastructure</p>

	-After-treatment of the vehicle -Handling of production rests
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetadata for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO <sub>2</sub> and SO <sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i> , the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation, the <i>maximum value</i> refer to an engine run 500 000 km. No minimum value was given.
<b>Literature Reference</b>	
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

#### Flow Table and Specific Meta Data

QMetadata	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Cargo	Cargo	1			tonne	Technosphere	
Date conceived: 1997-01-01 Data type: Unspecified, expert outspoke Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,37 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine	Input	Refined resource	Diesel environmental class 1	1.33	1.31	1.35	MJ	Technosphere	
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetadata for NO <sub>x</sub> .	Output	Emission	CO	0.11		0.13	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km. -Utilisation	Output	Emission	CO <sub>2</sub>	97	96	98	g	Air	

level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information								
Method: See QMetaData for NOx.	Output	Emission	HC	0.061		0.064 g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refers to an engine run 500 000 km. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)/l]*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were: Quantity value, i.e. average engine:</i> -NOx 6,3 g/kWh -HC 0,4 g/kWh -CO 0,7 g/kWh -Particles 0,11 g/kWh -Degree of efficiency on the engine: 41 % (assumption). The data was supplied by Volvo Truck Corporation. <i>Maximum value i.e. engine run 500 000 km</i> The data was supplied by Volvo Truck Corporation and expressed as percentage degeneration in emissions in relation to the average engine. The degeneration factors are based on special degeneration factor tests for EPA/CARB on 12 litre engines. The tests were performed on four engines run 470 000 km. The degeneration factors are an average of the tests. -NOx 6,4 g/kWh - 1,5 % degeneration in relation to the average engine -HC 0,42 g/kWh - 4 % degeneration in relation to the average engine -CO 0,8 g/kWh - 20 % degeneration in relation to the average engine -Particles 0,11 g/kWh - 2 % degeneration in relation to the average engine -Degree of efficiency on the engine: 41 % (assumption) No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine	Output	Emission	NOx	0.95		0.98 g	Air	

speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.									
Method: See QMetaData for NOx.	Output	Emission	Particles	0.0167		0.0172 g	Air		
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information	Output	Emission	SO2	0.00061	0.00058	0.00063 g	Air

<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .

<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %  The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b>  The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b>  The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b>  The data may be used for international transport if the data is recalculated for diesel</p>

	environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Heavy truck, max 24 tonnes, manufactured before 1992 [Euro 0]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport

<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven heavy truck with engine manufactured before 1992 (Euro 0 environmental standard). The vehicle is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.</p> <p>Maximum gross weight: 24 tonnes. Kerb weight: 10 tonnes. Available loading capacity with regard to weight: 14 tonnes. Length 24 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured before 1992
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to voluntary European emission regulations for diesel engines before 1992.</p>
<b>Literature Reference</b>	
<b>Notes</b>	<p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.</p>

Date conceived: 1997-03-01 Data type: Unspecified, expert outspoke Method: The diesel consumption per tonkm was calculated using assumptions on average fuel	Input	Refined resource	Diesel environmental class 1	1.33	1.32	1.34	MJ	Technosphere	

consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,37 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine								
	Output	Cargo	Cargo	1			tonne	Technosphere
Method: See QMetaData for NOx.	Output	Emission	CO	0.22		1.75 g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information	Output	Emission	CO2	97	96	98 g	Air	
Method: See QMetaData for NOx.	Output	Emission	HC	0.22		0.36 g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refer to voluntary European emission regulations for diesel engines before 1992. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)/l]*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/ (loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the</i>	Output	Emission	NOx	1.6	1.3	2 g	Air	

<p><i>Swedish Petroleum Institute:</i>          -Thermal value: 43,43 MJ/kg          -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were: Quantity value, i.e. average engine::</i> -NOx 11 g/kWh -HC 1,5 g/kWh -CO 1,5 g/kWh -Particles 0,4 g/kWh (estimated)          -Degree of efficiency on the engine: 39 % (assumed) The data was supplied by the Volvo Truck Corporation. <i>Maximum value, i.e. voluntary European emission regulations:</i> -NOx 14 g/kWh -HC 2,5 g/kWh -CO 12 g/kWh -Particles - g/kWh (not given) -Degree of efficiency on the engine: 39 %. No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.</p>									
Method: See QMetaData for NOx.	Output	Emission	Particles	0.058			g	Air	
<p>Date conceived: 1997-01-01          Data type: Derived, unspecified          Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <b><i>The following data was used in the calculations:</i></b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i>          -Thermal value: 43,43 MJ/kg          -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information</p>	Output	Emission	SO2	0.00061	0.0006	0.00063	g	Air	

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of</p>

	<p>organisations that participate in the work:  BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegoods) and wholesale (partigods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>The Swedish fleet</b>  The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:  After 1996: 10 %  95-92: 33%  Before 1992 52 %  The data was given by SIKA and SCB and concern vehicles larger than 3,5 tonnes.</p>

	<p><b>Bulky goods</b> The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b> The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b> The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. Method: See QMetaData for NOx.	Output	Emission	CO	0.15		0.67	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information	Output	Emission	CO2	97	96	98	g	Air	
Method: See QMetaData for NOx.	Output	Emission	HC	0.07		0.16	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the	Output	Emission	NOx	1.1		1.2	g	Air	

<p>maximum value refer to emission regulations for diesel engines according to the emission standard Euro I. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)/l]*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/(loading capacity [tonne]*utilisation level)</p> <p><b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,37 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i></p> <ul style="list-style-type: none"> <li>-Thermal value: 43,43 MJ/kg</li> <li>-Density: 0,81 kg/l</li> <li>-Sulphur content: 10 ppm</li> </ul> <p><i>The emission factors were: Quantity value, i.e. average engine:</i></p> <ul style="list-style-type: none"> <li>-NOx 7,6 g/kWh</li> <li>-HC 0,5 g/kWh</li> <li>-CO 1,0 g/kWh</li> <li>-Particles 0,2 g/kWh</li> </ul> <p>-Degree of efficiency on the engine: 40 % (assumed) The data was supplied by the Volvo Truck Corporation</p> <p><i>Maximum value, i.e. emission standard Euro I for diesel engines:</i></p> <ul style="list-style-type: none"> <li>-NOx 8 g/kWh</li> <li>-HC 1,1 g/kWh</li> <li>-CO 4,5 g/kWh</li> <li>-Particles 0,36 g/kWh</li> </ul> <p>-Degree of efficiency on the engine: 40 % (assumed) No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.</p>

## About Inventory

<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lagesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b> Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles</p> <p>--Wholesale goods (&gt; 1000 kg) are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --General goods (100-1000 kg) are generally handled via terminal. The goods may be both weight and volume limited --Parcel goods (&lt; 100 kg) are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b> --Truck max 3,5 tonnes is mainly used for transportation of parcels. --Light truck, max 8 tonnes is used for local distribution, mainly in city traffic. --Truck, max 18 tonnes is used for district distribution and local distribution in city traffic. --Truck, max 24 tonnes is mainly used for transportation of general (stykkegoods) and wholesale (partigoods) goods. --Heavy truck with trailer, max 60 tonnes is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland. --Truck with semitrailer, max 42 tonnes is used for international long-distance traffic.</p> <p><b>Utilisation level</b> The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no</p>

	<p>general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>The Swedish fleet</b></p> <p>The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:</p> <p>After 1996: 10 % 95-92: 33% Before 1992 52 %</p> <p>The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<p><b>About Data</b></p>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetadata).</p>
<p><b>Notes</b></p>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different</p>

transportation alternatives.

The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.

## SPINE LCI dataset: High purity copper production from primary raw materials

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1995
<i>Copyright</i>	Metall/ Berlin Metall Verla 1947-
<i>Availability</i>	Full availability

Technical System	
<i>Name</i>	High purity copper production from primary raw materials
<i>Functional Unit</i>	1 kg pure copper
<i>Functional Unit Explanation</i>	
<i>Process Type</i>	Gate to gate
<i>Site</i>	None
<i>Sector</i>	Materials and components
<i>Owner</i>	None
<i>Technical system description</i>	2.13 tons of copper concentrate containing 12% water are transported to mainly one plant in Germany where it is melted and refined to copper. The concentrate is melted in a suspension process with H2SO4 recycling in a converter with low slag production. 0.57 tons of scrap copper is added. The raw metal is refined and cast to anodes. The final refining is made through electrolysis to pure copper metal. H2SO4, copper slag, copper anode sludge and NiSO4 are byproducts.

System Boundaries	
<i>Nature Boundary</i>	Not given

<i>Date Conceived</i>	1995
<i>Data Type</i>	Unspecified, expert outspoke
<i>Represents</i>	German average
<i>Method</i>	Not given
<i>Literature Reference</i>	K.H. Bruch, D. Gohlke, C. Kögler, J. Kruger, M. Reuter, I. v. Röpenack, E. Rombach, G. Rombach, P. Winkler. Sachbilanz einer Ökobilanz der Kupfererzeugung und - verarbeitung, Teil 1. Metall 49(1995)4, 252-257, Teil 2. Metall 49(1995)5, 318-324, Teil 3. Metall 49(1995)6, 434-440.

<b>Notes</b>	The total energy use for primary production is 21.8 MJ/kg (6.3 MJ for copper production and 15.5 for energy production). A German electricity mix is used and described (in wastes and emissions) as well as the energy from fossil sources. Values in terms of MJ/kg for different transports are given with the specific emissions connected to them. The energy use for a number of help materials is included. The production of H2SO4 requires 13% of the primary energy used for the primary production.

<b>Applicability</b>	Can be used for western industrial countries. Best available technology in western Germany.
<b>About Data</b>	
<b>Notes</b>	If a cradle to gate process is to be calculated, data for ore mining and concentration (data set "Copper ore mining and concentration") has to be added. For the primary production of pure copper products 0.57 of the values for ore mining and concentration should be added which for energy is 20MJ/kg. This because the emissions and energy use are expressed per kg copper in concentrate and the copper content is assumed to be 30 weight%.

<b>Technical system description</b>	Operation of a ship used for high sea shipping
-------------------------------------	--

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Emissions to air from combustion of the fuel are included. Other environmental impacts from the operation of the ship are not included.
<b>Time Boundary</b>	The aim was that the figures would represent the fleet in 1992.
<b>Geographical Boundary</b>	Sweden and other countries with a similar fleet
<b>Other Boundaries</b>	Utilisation level of the ship is not known. <i>Not included in the system:</i> Production and distribution of the fuel Manufacture and maintenance of the ship
<b>Allocations</b>	
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1990-1994
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	German average
<b>Method</b>	Data compiled from <i>different literature sources</i> . The emissions were calculated from emission factors; the emission factor for each specific substance was multiplied with the energy use for the given transport. The emission factors were: SO <sub>2</sub> 1,28 g/MJ NO <sub>x</sub> 2,5 g/MJ CO 0,22 g/MJ CO <sub>2</sub> 72 g/MJ HC 0,06 g/MJ Particles 0,11 g/MJ For details on how the emission factors were obtained, see metadata for each specific substance. Metadata for CO and HC can be found under CO. Metadata for SO <sub>2</sub> and particles can be found under SO <sub>2</sub> .

Date conceived: 1990 Data type: Unspecified Method: The data for energy use for high sea shipping recommended by Tillman were found in Lenner. The recommendation was based on the energy use for high sea shipping found in Habersatter (0,2 MJ/tonkm). The energy use reported by Lenner are intended to represent an average value for all shipping in Sweden. The value is therefore a combination of several types of ships with energy use between 0,09 MJ/tonkm and 0,349 MJ/tonkm. Lenner found the energy use for different types of ships, loads and average speeds in figure A3: 2 in Cordi. Cordi has however not stated how the background material for figure A3: 2 was retrieved. depending on e. g. size, shape of the hull, hydrodynamic properties and engine strength. This can give a very broad distribution in the energy use depending on which individu								
Notes:	Output	Cargo	Cargo	1.000000			tonne	Technosphere
Date conceived: 1992 Data type: Unspecified Method: Lenner has calculated <i>average emission factors</i> in g/tonkm, intended to represent an average value for all shipping in Sweden. They are therefore calculated for a combination of several types of ships. Emission factors in g/MJ were obtained by division of the emission factors in g/tonkm by the average energy use (0,051 g/MJ). Lenner has not stated how the values were retrieved. Literature: Lenner, M. `Energiförbrukning och avgasemission för olika transporttyper` VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Notes:	Output	Emission	CO	0.04			g	Air
Date conceived: 1992 Data type: Modeled data Method: The emission factor was calculated from the fuel use (0,18 g/MJ) using the carbon content in diesel. The data used in the calculation was: Heat value: 42,82 MJ/kg Density: 0,83 kg/dm3 CO2 emission: 2,61 kg CO2/dm3 fuel Literature: Lenner, M. `Energiförbrukning och avgasemission för olika transporttyper` VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Notes:	Output	Emission	CO2	13			g	Air
Notes:	Output	Emission	HC	0.011			g	Air
Date conceived: 1992 Data type: Unspecified Method: Lenner has calculated an <i>average emission factor</i> in g/tonkm, intended to represent an average value for all shipping in Sweden. They are therefore calculated for a combination of several types of ships. Emission factors in g/MJ were obtained by division of the emission factors in g/tonkm by the average energy use (0,051 g/MJ). The data was based on figures found in a document written by the Swedish Environmental Agency (Planeringsunderlag..). The emission factors in this document are given for four-stroke engines, and based on an investigation of exhaust emissions from shipping in Sweden made by Alexandersson. Data on specific emissions given in Alexandersson were mainly based on data from laboratory measurements by engine manufacturers but also measurements onboard three ships and other projects that has conducted measurements onboard sailing ships. Literature: Alexandersson, A. "Sjöfartens utsläpp av avgaser" TFB-meddelande nr 164, Transportforskningsdelegationen, Stockholm 1990. Lenner, M. "Energiförbrukning och avgasemission för olika transporttyper" VTI-meddelande nr 718, Statens Väg- och Trafikinstitut, 1993 Planeringsunderlag för samordnad investeringsplanering 1994-2003. Statens Naturvårdsverk 1992-04-15 Notes:	Output	Emission	NOx	0.45			g	Air
Notes:	Output	Emission	Particles	0.02			g	Air
Date conceived: 1991 Data type: Unspecified Method: Exhaust emission factors in g/tonkm can be read in figure 25 in Alexandersson. To obtain emission factors in g/MJ, Tillman has divided the emission factors in g/tonkm with an energy use of 0,47 MJ/tonkm Figure 25 in Alexandersson is based on total exhaust	Output	Emission	SO2	0.23			g	Air

emissions and transportation by domestic shipping in Sweden 1987. It is not however clear how the background data for figure 25 were collected.  
Literature: Alexandersson, A. "Sjöfartens utsläpp av avgaser" TFB-meddelande nr 164, Transportforskningsdelegationen, Stockholm 1990.  
Notes:

## About Inventory

<b>Publication</b>	Tillman, A-M. "Goods transportation in life cycle assessment. Standard values for energy consumption and emissions." In: Life Cycle Assessment - Inventory Analysis Methodology: Overview, Recycling, Electricity and Transports, Swedish Waste Research Council (AFR) report nr 74, April 1995  ----- Documentation and review of the report done by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology -----
<b>Intended User</b>	LCA practitioners
<b>General Purpose</b>	To fulfil a need for <i>standard values</i> to calculate energy use and exhaust emissions from goods transports.
<b>Detailed Purpose</b>	An <b>update</b> of standard values for energy use and exhaust emissions from an earlier investigation in: Tillman, A-M., Baumann, H., Eriksson, E., Rydberg, T. "Livscykelanalyser för förpackningsmaterial - beräkning av miljöbelastning" SOU 1991:77, Allmänna förlaget, Stockholm, 1991.
<b>Commissioner</b>	-
<b>Practitioner</b>	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden
<b>Reviewer</b>	Pålsson, Ann-Christin - CPM Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg
<b>Applicability</b>	<i>Reviewers comment:</i> The data should be <b>used with great care</b> . The energy use for different types of ships can vary depending on e. g. size, shape of the hull, hydrodynamic properties and engine strength. This can give a very broad distribution in the energy use depending on which individual ships the energy use were based.
<b>About Data</b>	The emissions were calculated from the energy use and emission factors. The emission factors that were used and the basis for them can be found in general metadata.

## SPINE LCI dataset: Hot rolling of steel sheet

### Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

### Technical System

<b>Name</b>	Hot rolling of steel sheet
<b>Functional Unit</b>	1 kg hot rolled steel sheet
<b>Functional Unit Explanation</b>	Before the steel can be coated, different pre treatments has to be done. The steel from the steel mill is first hot rolled and then pickled. After the pickling process, the steel is cold reduced and then finally coated.
<b>Process Type</b>	Gate to gate

<b>Site</b>	SSAB Tunnpålt
<b>Sector</b>	Materials and components
<b>Owner</b>	SSAB Tunnpålt
<b>Technical system description</b>	<p>This activity describes a process step included in the system "Production of plywood boxes", also available in the SPINE@CPM database. Plywood boxes are used to pack the coated and non-coated roller bearings from SKF, Göteborg, during the transportation to customers. The plywood boxes are manufactured by Nefab Emballage AB in Alfta, Sweden. The plywood box consist of plywood, steel strips, steel nails and wooden splits.</p> <p>The steel for the steel strips and steel nails is hot rolled, pickled, cold reduced and finally coated at SSAB Tunnpålt's line in Borlänge. This dataset describes the hot rolling of 1 kg steel sheet at SSAB Tunnpålt AB in Borlänge.</p> <p>All data for the hot rolling processes is obtained from an already made LCA at Nefab Emballage AB: Hillvall Maria; Transportförpackningars bidrag till reduktion av miljöbelastningen; Master Thesis at the Technical University of Luleå; 2000.</p> <p>The data refers to an existing EPD from SSAB Tunnpålt AB: Environmental Product Declaration from SSAB; SE 380; June 1999</p>

System Boundaries	
<b>Nature Boundary</b>	Emissions to air and water are included. The steel scrap from the process is reused as raw material and is thus not considered as waste, but as a co-product ending in the technosphere.
<b>Time Boundary</b>	This environmental profile refers to the mean values of emissions to which hot rolling of steel sheet gives rise in Borlänge during the years 1998-1999.
<b>Geographical Boundary</b>	The hot rolling of steel sheet takes place at SSAB Tunnpålt's line in Borlänge, Sweden.
<b>Other Boundaries</b>	The production of electricity is NOT included in the dataset, but must be followed from the cradle in order to obtain the total environmental impact. This must also be done with the production of LPG and the production of oil.
<b>Allocations</b>	Allocations have been made according to weight.
<b>Systems Expansions</b>	Not applicable

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	02-08-01 - 02-12-31
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	German average

About Inventory	
<b>Publication</b>	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
<b>Intended User</b>	Product developers at SKF.
<b>General Purpose</b>	The data documentation is accomplished as a part of the thesis work "LCA-based solution selection", performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
<b>Detailed Purpose</b>	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. Both types of bearings are packed in a plywood box. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
<b>Commissioner</b>	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
<b>Practitioner</b>	Helene Berg - .
<b>Reviewer</b>	Olle Ramnäs -
<b>Applicability</b>	The dataset is applicable to hot rolling of steel sheet at SSAB Tunnpåt AB in Borlänge.
<b>About Data</b>	All data for the process is obtained from an earlier LCA study at Nefab Emballage AB: Hillvall Maria; Transportförpackningars bidrag till reduktion av miljöbelastningen; Master Thesis at the Technical University of Luleå; 2000.  The data refers to an existing EPD from SSAB Tunnpåt AB: Environmental Product Declaration from SSAB; SE 380; June 1999.

## SPINE LCI dataset: Hungary, electricity generation mix 1998

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2001-01-31
<b>Copyright</b>	IEA
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Hungary, electricity generation mix 1998
<b>Functional Unit</b>	Total electricity produced during 1998
<b>Functional Unit Explanation</b>	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
<b>Process Type</b>	Unit operation
<b>Site</b>	Hungary
<b>Sector</b>	Energyware
<b>Owner</b>	Hungary
<b>Technical system description</b>	The generation of electricity with different power generating systems in Hungary during the year 1998.

System Boundaries	
<b>Nature Boundary</b>	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
<b>Time Boundary</b>	The data refer to 1998.
<b>Geographical Boundary</b>	Only electricity produced in Australia is considered. Import or export of electricity is not included.
<b>Other Boundaries</b>	-
<b>Allocations</b>	Not applicable
<b>Systems Expansions</b>	Not applicable

SPINE LCI dataset: HVO combustion in heavy duty truck or bus, Euro VI, tank-to-wheel, f3 fuels

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	2013-11-30

<b>Copyright</b>	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
<b>Availability</b>	Public

Technical System	
<b>Name</b>	HVO combustion in heavy duty truck or bus, Euro VI, tank-to-wheel, f3 fuels
<b>Functional Unit</b>	1 MJ
<b>Functional Unit Explanation</b>	1 MJ input of HVO to vehicle tank
<b>Process Type</b>	Gate to grave
<b>Site</b>	
<b>Sector</b>	Fuel
<b>Owner</b>	
<b>Technical system description</b>	<p>The data represent emissions from hydrotreated vegetable oil (HVO) combustion in heavy duty truck or bus, Euro VI, tank-to-wheel.</p> <p>The emission legislation uses the definition of a heavy duty vehicle having a gross weight of 3.5 tons or more.</p> <p>The reported emission factors should be considered as generic data, and it should be noted that the emissions for a specific vehicle and a specific mission might differ from those generic data. For example, the limit values for certification of engines have been used as basis for deriving some of the emission factors. The duty cycles used for certification are defined to cover the whole range of typical loads of an engine in different operations. The operation of a specific vehicle can however differ from the duty cycle used in the certification, resulting in different emissions than calculated with the generic emission factors. E.g. for the regulated emissions: nitrous oxides, particles, total organic compounds and carbon monoxide, the values are conservative based on the maximum emissions limits per kWh of engine output when driving at the best point (the optimal engine speed/torque operating point). In reality, the values are often lower.</p>

Method: THC minus CH4. Literature: THC is from limit in Euro V legislation	Output	Emission	Non-methane volatile organic compounds	0.0000605			kg	Air	
Method: Regulated emission calculated according to: EF fuel use (g/MJ)=EF work (g/kWh) /3.6*? Literature: Limit in Euro V legislation	Output	Emission	Particles (unspecified)	3.66666666666667E-06			kg	Air	
Method: The legislative limit is 10 mg/kg (10 ppm) (Dir 2009/30/EC), but here a typical value is chosen. 1 kg of S generates 2 kg of SO2. The heat value used for calculation to SO2 from per kg fuel to per MJ fuel	Output	Emission	Sulfur dioxide	1.36054421768707E-07			kg	Air	

was 44.1 MJ/kg (HVO Handbook).  
Literature: Typical value

## About Inventory

<b>Publication</b>	Hallberg et al, (2013) "Setup of f3 data network for Well-to-wheel (method and) LCI data for fossil and renewable fuels in the Swedish market", f3 - Swedish Knowledge Centre for Renewable Transportation Fuels, f3 project report, Available at <a href="http://www.f3centre.se">www.f3centre.se</a>
<b>Intended User</b>	LCA practitioner
<b>General Purpose</b>	To provide and publish best available LCI data on vehicle biofuels and fossil fuels well to tank and tank to wheel relevant for the Swedish market.
<b>Detailed Purpose</b>	
<b>Commissioner</b>	- f3 - The Swedish Knowledge Centre for Renewable Transportation Fuels.
<b>Practitioner</b>	- Lisbeth Dahllöf (Volvo Group), Helen Mikaelsson (Scania).
<b>Reviewer</b>	- Lisa Hallberg, IVL
<b>Applicability</b>	
<b>About Data</b>	This dataset is the part of the results from the f3 project "Setup of f3 data network for Well-to-wheel (Method and) LCI data for fossil and renewable fuels in the Swedish market". Further details about this project can be found in the project report.
<b>Notes</b>	

SPINE Data Report © SLC, Chalmers University of Technology, 2020 SLC - the Swedish life cycle center

## SPINE LCI dataset: Hydro electricity energy system, EPD-version

### Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	1996-10
<b>Copyright</b>	Bundesamt für energie, Bern
<b>Availability</b>	Public

### Technical System

<b>Name</b>	Hydro electricity energy system, EPD-version
<b>Functional Unit</b>	1 TJ net electricity from power plant
<b>Functional Unit Explanation</b>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	UCTPE countries Europe
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	UCTPE countries Europe
<b>Technical system description</b>	<p>Reported figures are based on data from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996 and adapted to the demands of the EPD-guidelines (Environmental Product Declaration guidelines in Sweden).</p> <p>The main emphasis in ETH:s study has been in the description of hydro power plants typical for Switzerland and the alpine region, with power outputs between about 0.1 MW and 350 MW. Three types of power plants are distinguished, namely, run of river (without storage), water storage and pumped storage power plants.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e.</p>

	<p>data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle. Energyware (fuels and electricity) is used during construction (ground works), in material manufacturing processes, transports etc.</p> <p>Figures reported here are based on LCI results for two types of plants: hydro power plants with and without storage and represent the average hydro power in the UCPTE* countries 1990-1994. Average hydro power production in the UCPTE was 158 TWh/year in 1990-94 (plants with storage: 48%, plants without storage 52%). The average operation time was about 2900 hours per year.</p> <p>Detailed data concerning the construction and demolition of hydro power plants including storages, has been gathered by ETH, i.e. figures reported here comprise only construction and demolition of hydro power plants.</p> <p>The following has been inventoried:</p> <ul style="list-style-type: none"> <li>- manufacture of materials from natural resources and scrap</li> <li>- manufacture of capital goods (rough estimation)</li> <li>- exploration and extraction of energyware</li> <li>- transports</li> <li>- ground works (excavation etc)</li> <li>- waste handling (different kinds of landfills, waste incineration plants)</li> </ul> <p>Energyware consumed in pumps used for seasonal storage has been accounted for.</p> <p>Following parameters and activities have been taken into account by ETH: consumption of cement, steel and explosives, transports, consumption of energyware during the construction phase (electricity and diesel), use of land, usable content in water storages, amount of turbine water. Figures concerning the three latter parameters are not reported here but are described under "other boundaries".</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
--	--

## System Boundaries

### *Nature Boundary*

Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).

ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.

Vattenfall's criterion in selecting and aggregating ETH's LCI-results for electricity generation in the UCPTE region has been to make the figures usable as general electricity LCI data in EPDs according to Miljöstyvningsrådets guidelines.

Especially parameters (emissions) which have established impact indices - accepted by the EPD system - for one or several environmental impact categories, have been picked out and aggregated as far possible. But also metal and energyware resources have been included, as well as waste, in spite of all waste handling processes related to this dataset being included with respect to use of resources and emissions. The latter is an adaption to other LCI data for electricity generation where waste amounts are reported (since those flows have not been followed to the grave).

Since ETH claims that most of the figures regarding metal emissions have an undefined amount of datagaps all metal emissions are aggregated except for a few which are specified separately since they are reported for most processes in the lifecycle. Metals are reported as elements although they often are part of compounds. Measuring methods often just give the amounts of the different elements found.

All hydrocarbons to water are aggregated to one parameter as well as halogenated organics, since no indices exist (that are accepted by the EPD system so far) for characterisation of the individual substances.

### *Time Boundary*

The figures describe the average operation of studied plants in 1994.

Figures concerning fuel extraction and processing represent an average of the early nineties.

Descriptions and figures of different technical processes come from literature, contractors, public and private institutions and describe the situation of the late eighties.

Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTE\* countries between 1990-94 (to level off the large variations in hydro power production over the years).

All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.

	<p>Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:</p> <p>Alpine hydro power plants Low pressure hydro power with and without storage plants (rivers and channels) Cement 200 years 80 years Steel, reinforcement 100 years 80 years Steel, other 60 years 60 years Explosives 250 years 100 years Transports 150 years 60 years Energyware, construction 150 years 80 years</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Geographical Boundary</b>	<p>No geographical boundaries have been drawn except concerning the location of the studied plants in Switzerland and the consumption of generated electricity in the UCPT* region. Processes conducted outside the UCPT* region are supposed to be supplied with UCPT* electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Other Boundaries</b>	<p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPT* electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH's LCA for coal power.</p> <p>The ETH study comprises figures concerning use of land, usable content in water storages and amount of turbine water which have not been reported here. The two latter have been excluded due to lack of corresponding data in comparable studies.</p> <p>Use of land has been excluded here because of ETH's advanced approach. Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.</p> <p>Land Criterion Category Natural human impact not larger than other species' since the industrial revolution I Modified human impact larger than other species', low degree of cultivation II Cultivated human impact larger than other species', large degree of cultivation III Built upon dominated by buildings, roads, dams, mines etc. IV</p> <p>Category I is not used in the study.</p> <p>State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.</p> <p>ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. they express use of land in the unit m<sup>2</sup>/year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below: From category IV to category III 5 years From category III to category II 50 years From category II to category I 100 000 years</p> <p>(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)</p> <p>ETH specifies about 160 radioactive isotopes emitted to air and water. Radioactive emissions reported here are picked out in accordance with SETAC working group report on data quality and data availability (to be published in 2001).</p> <p>Big accidents occurring seldomly are not included. The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>The water flow in rivers is regulated not just to assure a electricity generation adapted to the electricity need but also to protect land from overflowing. All environmental load in connection with water regulation (dams etc) has however been layed on hydro power.</p> <p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<i>Date Conceived</i>	1985 to 1995
<i>Data Type</i>	Derived, unspecified
<i>Represents</i>	Average hydro power in the UCTPE countries (except pumped storage used for daily regulation of power production)
<i>Method</i>	The data has been adapted from the Ökoinventare von Energiesystemen, ETH Zürich 1996, and is an aggregation of the LCI results for the module "electricity from hydro power, UCPTE" (Strom ab Wasserkraft, UCPTE).
<i>Literature Reference</i>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<i>Notes</i>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

### Intended User

Original study of ETH: LCA pra

### General Purpose

The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their lifecycles. The results can be used in lifecycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.

Vattenfalls purpose - as a commissioner of putting ETH:s data into Spine format with metadata - is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyrningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines. Data is supposed to be used together with IEA statistics about electricity generation mixes in the OECD countries/regions.

### Detailed Purpose

ETH:s aim was to examine some important aspects of the environmental impact of hydro power plants in the UCPTE. The consumption of cement, steel, explosives and energyware during the construction phase is considered as well as transports, usable content of storages and the amount of water passing the turbines. Plants with and without storages are studied.

### Commissioner

BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .

### Practitioner

Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .

### Reviewer

None, see further under notes -

### Applicability

The LCI-results of the three types of plants studie in the ETH study are valid for hydro power in Switzerland but are supposed to be a rather good approximation for hydro power in UCPTE. The two types, hydro power plants with and without storage, have been summarized to one set of data "Hydro Power in UCPTE" in accordance with existing percentages of those types of plants in the UCPTE region. Only this aggregated set of data is reported here. The result of the third type of hydro power plant is reported under the name "Hydro Power with pumped storage in UCPTE" in ETH's study (this kind of power plant is used to convert base load to peak load electricity with an efficiency of about 70%).

This set of data is aggregated and documented in accordance with the Swedish EPD-guidelines to be used in combination with IEA statistics concerning electricity generation mixes in OECD countries and regions together with other datasets - based on the ETH study - describing other power generation systems.

The EPD-adapted power generation systems in Spine format are named as follows:  
Fuel gas electricity energy system, EPD-version  
Biofuel electricity energy system (approximation), EPD-version  
Hydro electricity energy system, EPD-version  
Lignite electricity energy system, EPD-version  
Nuclear electricity energy system, EPD-version  
Stone coal electricity energy system, EPD-version  
Wind electricity energy system, EPD-version

	<p>IEA statistics for generation mixes 1998 exist in Spine format for the following 30 countries/regions:</p> <p>OECD total  OECD North America  OECD Pacific  OECD Europe  European Union  Australia  Austria  Belgium  Canada  Czech Republic  Denmark  Finland  France  Germany  Greece  Hungary  Iceland  Ireland  Italy  Japan  Korea  Luxembourg  Mexico  Netherlands  New Zealand  Norway  Poland  Portugal  Spain  Sweden  Switzerland  Turkey  United Kingdom  United States</p>
<b>About Data</b>	<p>Only the most important construction materials have been inventoried as well as transports and energyware consumption during the construction phase, i.e. consumption of copper, concrete additives or possible recycling processes of scrapped material etc. have been excluded.</p> <p>Data quality regarding inventoried material and energyware amounts is high, since the sources are reliable. The division of the steel consumption in the three different steel qualities has however been estimated.</p> <p>Due to difficulties in finding detailed data regarding the construction of studied plants (some data has been estimated) the results should be seen as approximate.</p> <p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided).</p> <p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Publication, Notes and General metadata.</p>
<b>Notes</b>	<p>Reviewer of this specification of ETH:s data and metadata has been:  Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of aggregation of figures and of Vattenfall's interpretation of the documentation  Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements.  The technical committee of the Swedish Environmental Management Council - approval of method and aggregation of parameters</p> <p>Project Management of the ETH study, 3rd edition:  Professor, Dr. P. Suter and R. Frischknecht, ETH</p> <p>Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH  R. Dones, E. ## SPINE LCI dataset: Hydro electricity energy system, ETH - full version

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-10
<b>Copyright</b>	Bundesamt für energie, Bern
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Hydro electricity energy system, ETH - full version
<b>Functional Unit</b>	1 TJ net electricity from power plant
<b>Functional Unit Explanation</b>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	UCTPE countries Europe
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	UCTPE countries Europe
<b>Technical system description</b>	<p>Reported figures come from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996.</p> <p>The main emphasis in ETH:s study has been in the description of hydro power plants typical for Switzerland and the alpine region, with power outputs between about 0.1 MW and 350 MW. Three types of power plants are distinguished, namely, run of river (without storage), water storage and pumped storage power plants.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle. Energyware (fuels and electricity) is used during construction (ground works), in material manufacturing processes, transports etc.</p> <p>Figures reported here are based on LCI results for two types of plants: hydro power plants with and without storage and represent the average hydro power in the UCPTE* countries 1990-1994. Average hydro power production in the UCPTE was 158 TWh/year in 1990-94</p>

	<p>(plants with storage: 48%, plants without storage 52%). The average operation time was about 2900 hours per year.</p> <p>Detailed data concerning the construction and demolition of hydro power plants including storages, has been gathered by ETH, i.e. figures reported here comprise only construction and demolition of hydro power plants.</p> <p>The following has been inventoried:</p> <ul style="list-style-type: none"> <li>- manufacture of materials from natural resources and scrap</li> <li>- manufacture of capital goods (rough estimation)</li> <li>- exploration and extraction of energyware</li> <li>- transports</li> <li>- ground works (excavation etc)</li> <li>- waste handling (different kinds of landfills, waste incineration plants)</li> </ul> <p>Energyware consumed in pumps used for seasonal storage has been accounted for.</p> <p>Following parameters and activities have been taken into account by ETH: consumption of cement, steel and explosives, transports, consumption of energyware during the construction phase (electricity and diesel), use of land, usable content in water storages, amount of turbine water. Figures concerning the three latter parameters are not reported here but are described under "other boundaries".</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>

## System Boundaries

### *Nature Boundary*

Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).

Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.

Land Criterion Category

Natural human impact not larger than other species' since the industrial revolution I  
Modified human impact larger than other species', low degree of cultivation II  
Cultivated human impact larger than other species', large degree of cultivation III  
Built upon dominated by buildings, roads, dams, mines etc. IV

Category I is not used in the study.

State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.

ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m<sup>2</sup>year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below:

From category IV to category III 5 years  
From category III to category II 50 years  
From category II to category I 100 000 years

(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)

ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.

### *Time Boundary*

The figures describe the average operation of studied plants in 1994.

Figures concerning fuel extraction and processing represent an average of the early nineties.

Descriptions and figures of different technical processes come from literature, contractors, public and private institutions and describe the situation of the late eighties.

Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTE\* countries between 1990-94 (to level off the large variations in hydro power production over the years).

All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.

Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:

	<p>Alpine hydro power plants Low pressure hydro power with and without storage plants (rivers and channels) Cement 200 years 80 years Steel, reinforcement 100 years 80 years Steel, other 60 years 60 years Explosives 250 years 100 years Transports 150 years 60 years Energyware, construction 150 years 80 years</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Geographical Boundary</b>	<p>No geographical boundaries have been drawn except concerning the location of the studied plants in Switzerland and the consumption of generated electricity in the UCPT* region. Processes conducted outside the UCPT* region are supposed to be supplied with UCPT* electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Other Boundaries</b>	<p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPT* electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power.</p> <p>Big accidents occurring seldomly are not included. The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>The water flow in rivers is regulated not just to assure a electricity generation adapted to the electricity need but also to protect land from overflowing. All environmental load in connection with water regulation (dams etc) has however been layed on hydro power.</p> <p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1985 to 1995
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average hydro power in the UCPT* countries (except pumped storage used for daily regulation of power production)
<b>Method</b>	The figures have been copied from the module "Electricity from hydro power, UCPT*" (Strom ab Wasserkraft, UCPT*) in the Ökoinventare von Energiesystemen, ETH Zürich 1996.
<b>Literature Reference</b>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<b>Notes</b>	Multiple flows are reported for several emissions to air. This is because that in the original study emissions to air have been reported in three categories, indicated by one of the letters below following the substance name. - m = mobile (emissions from vehicles) - p = process (process specific emissions as for instance methane emissions during coal mining) - s = stationary (emissions from stationary combustion plants) This categorisation has however not been documented in this specification in the SPINE format.

About Inventory	
<b>Publication</b>	<p>Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at <a href="http://www.energieforschung.ch">http://www.energieforschung.ch</a></p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by (see also Notes):  Rolf Frischknecht, ESU-services, Switzerland  Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden</p> <p>-----</p>
<b>Intended User</b>	Original study of ETH: LCA pra
<b>General Purpose</b>	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their lifecycles. The results can be used in lifecycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.
<b>Detailed Purpose</b>	ETH:s aim was to examine some important aspects of the environmental impact of hydro power plants in the UCPTE. The consumption of cement, steel, explosives and energyware during the construction phase is considered as well as transports, usable content of storages and the amount of water passing the turbines. Plants with and without storages are studied.
<b>Commissioner</b>	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
<b>Practitioner</b>	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .
<b>Reviewer</b>	None, see further under notes -
<b>Applicability</b>	The LCI-results of the three types of plants studied in the ETH study are valid for hydro power in Switzerland but are supposed to be a rather good approximation for hydro power in UCPTE. The two types, hydro power plants with and without storage, have been summarized to one set of data "Hydro Power in UCPTE" in accordance with existing percentages of those types of plants in the UCPTE region. Only this aggregated set of data is reported here. The result of the third type of hydro power plant is reported under the name "Hydro Power with pumped storage in UCPTE" in ETH's study (this kind of power plant is used to convert base load to peak load electricity with an efficiency of about 70%).
<b>About Data</b>	<p>Only the most important construction materials have been inventoried as well as transports and energyware consumption during the construction phase, i.e. consumption of copper, concrete additives or possible recycling processes of scrapped material etc. have been excluded.</p> <p>Data quality regarding inventoried material and energyware amounts is high, since the sources are reliable. The division of the steel consumption in the three different steel qualities has however been estimated.</p> <p>Due to difficulties in finding detailed data regarding the construction of studied plants (some data has been estimated) the results should be seen as approximate.</p> <p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided).</p>

	<p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Publication, Notes and General metadata.</p>
<b>Notes</b>	<p>Reviewer of this specification of metadata describing the ETH study has been: Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of Vattenfall's interpretation of the documentation Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements</p> <p>Project Management of the ETH study, 3rd edition: Professor, Dr. P. <b>Finished</b>	Y
<b>Date Completed</b>	1996-12-01
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Hydro-electric power station with support systems
<b>Functional Unit</b>	Net production of 1 kWh electricity
<b>Functional Unit Explanation</b>	The emissions and use of resources and raw materials are associated with the production of 1 kWh electricity.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	Vattenfall - Lule river
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	Vattenfall - Lule river
<b>Technical system description</b>	<p>The environmental influence of <i>operation and maintenance of a hydro-electric power station</i> are included in the system. Production of materials and chemicals and transports used in association with the operation and maintenance are included.</p> <p>To represent the hydro-electric power plants of Vattenfall, three hydro-electric power plants in river Lule have been studied:</p> <ul style="list-style-type: none"> <li>• <i>Seitevare with Tjaktjajaure annual storage basin</i>, located in a mountain region -an under ground station, with an effect of 214 MW and normal annual production 799 GWh. The basin is filled during the spring, summer and fall and generally tapped between October and April</li> <li>• <i>Harsprånget</i> has a large river flow and high drop, and is located in a forest region - under ground plant, with an effect of 940 MW and normal annual</li> </ul>

	<p>production 2159 GWh. The plant has five units.</p> <ul style="list-style-type: none"> <li>• <i>Boden</i> has only part of the river flow and medium drop, and is located in a coastal region - an above ground plant, with an effect of t 80 MW and normal annual production 464 GWh.</li> </ul> <p>Vattenfall has about 70 wholly-owned and 70 part-owned hydro-electric power stations in Sweden. The electricity production primarily affect river Lule, river Skellefte, river Ume, Ångermanälven, Indalsälven, Dalälven, Motala stream and river Göta. During a normal year, the electricity production in Vattenfall:s plants are 32 TWh, which is about 50 % of the total electricity production by water power in Sweden.</p> <p>All hydro-electric power electricity production are based on two fundamental conditions: water supply and drop. More water and greater drop gives a larger electricity production. The water supply varies during the year, and to use the available water supply during the year, reservoirs and power stations are built along the watercourse.</p>
--	---

System Boundaries	
<b>Nature Boundary</b>	<p>The analysis starts at one of the water storage basins and then the river are followed through the power plants and dams, tunnels, machine stations and outlets to the outlet into the sea. Flows above the storage basin have been excluded because the environmental effect of the expansion (utbyggnad) above the annual storage facilities are considered to be a small.</p> <p>All emissions are considered equivalent independent of where they take place (locally, regionally, globally; in densely populated areas or rural areas).</p>
<b>Time Boundary</b>	<p>The power plant are assumed to operate during 60 years. The power plants can however operate longer than that. The probability that the power stations will ever be demolished are small.</p>
<b>Geographical Boundary</b>	<p>The analysis are divided into three systems. The three systems represent three representative power stations in river Lule; Seitevare with Tjaktjajaure annual storage basin, Harsprånget and Boden.</p>
<b>Other Boundaries</b>	<p>The studied system include <i>operation and maintenance of the power plant</i>. Calculations of building and demolition of the plant has been performed but are not included in this system.</p> <p><b>Sub-systems included in the system:</b></p> <ul style="list-style-type: none"> <li>• Manufacture and transport of materials for reinvestments and reconstruction</li> <li>• Transports of operation personnel</li> <li>• Known use of chemicals are accounted for. In the cases where it was possible to obtain data, resource use and emissions for manufacture are included.</li> <li>• Use of resources and emissions to air from production of the electricity used in the life cycles.</li> <li>• Energy use and emissions for the production of oil for the studied manufacturing processes and transports.</li> </ul> <p><b>Sub-systems excluded from the system:</b></p> <ul style="list-style-type: none"> <li>• Equipment after the power station transformer are not included.</li> <li>• Emissions at ordinary occurring operation disturbances have only been studied for water power and have been included when the emissions from the operation disturbance are at least 10% of the corresponding emissions from building and normal operation of the water power station.</li> </ul>

	<ul style="list-style-type: none"> <li>• The risk of major accidents and rare breakdowns and environmental consequences from these.</li> <li>• Waste and rest products are transported to final waste. Operation and chemical and biological decomposing processes (nedbrytningsprocesser) in the final waste have not been considered.</li> <li>• Work environment.</li> <li>• Environmental loads caused by the operation personnel.</li> </ul>
<b>Allocations</b>	The 50/50 method has been applied throughout the analysis. The method is described in "Nordic Guidelines on Life-Cycle Assessment", Nord 1995:20, The Nordic Council, Stockholm.
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average hydro power in the UCTPE countries (except pumped storage used for daily regulation of power production)
<b>Method</b>	An LCA calculation on the operation of a water power plant
<b>Literature Reference</b>	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S., "Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport", in Swedish, Vattenfall AB
<b>Notes</b>	Note: The unit for CO is corrected, from g to mg (2000-08-17). The parameters that are presented are chosen because they have a general interest and because the basis for these parameters are relatively good. All values are reported with 3 figures. The data are however seldom that accurate. Emissions of NOx, CO2, CO and SO2 originate primarily from transports in association with operation and maintenance. The choice of power plants in river Lule gives long transport distances. Production of materials also causes relatively large emissions of SO2 and CO2.

About Inventory	
<b>Publication</b>	Brännström-Norberg B-M., Dethlefsen U., Johansson R., Setterwall C., Tunbrant S., "Livscykelanalys för Vattenfalls elproduktion - Sammanfattande rapport", Vattenfall AB  ----- Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology -----
<b>Intended User</b>	The data can be used as a basi
<b>General Purpose</b>	<ul style="list-style-type: none"> <li>• The work with life-cycle analysis are expected to <i>contribute to a reinforcement and structuring</i> of the environmental work within Vattenfall, and a deeper knowledge on the use of resources and emissions to the environment.</li> <li>• An LCA can <i>facilitate a need for reliable data for electricity production</i>. Electricity is used in the manufacture of almost every product, and data from an LCA can be used when conducting an LCA on products.</li> <li>• An LCA can <i>facilitate a choice between different techniques</i> for future electricity production.</li> <li>• An LCA can also help to <i>choose the most effective alternatives</i> to reduce the consumption of resources and environmental influence of the current electricity production system.</li> <li>• It is also possible to <i>compare</i> the environmental load for different alternatives of electricity production.</li> </ul>
<b>Detailed Purpose</b>	To obtain a <i>reliable basis</i> to be able to perform life-cycle analyses of different types of electricity use, and to identify opportunities for improvements in the existing system. To identify data gaps and areas where the knowledge are poor.
<b>Commissioner</b>	- Vattenfall Elproduktion .
<b>Practitioner</b>	- Vattenfall Energisystem AB: Britt-Marie Brännström-Norberg Ulrika Dethlefsen Roland Johansson Caroline Setterwall Sofie Tunbrant .
<b>Reviewer</b>	- Thomas Ekvall, Chalmers Industriteknik (CIT) Gunnar Lindfors, Institutet för Vatten- och Luftvårdsforskning (IVL) Göran Finnveden, Institutet för Vatten- och Luftvårdsforskning (IVL)
<b>Applicability</b>	The studied system include <a href="#">operation and maintenance of a hydro-electric power plant</a> . The analysis are based on data from three hydro-electric power plants in river Lule that are chosen to make the analysis <i>representative for the operation of Vattenfall:s plants</i> . There are differences between the three power stations. The differences are however not larger than an average value should be representative for the water power along the entire river Lule. The data are reliable since specific plants have been studied. The consequence is however that the result is primarily valid for the studied plants. Thoroughly reliable data for every power source, requires life cycle analyses for a large number of power plants for every power source. Nuclear and water power are the base for Vattenfall:s electricity production system. Vattenfall produces 50 % of the

electricity produced by water power in Sweden.

River Lule has been chosen in the analysis because:

- River Lule generates the most electricity, approximately 50% of Vattenfall:s water power production and 1/9 of the entire electricity production of Sweden.
- There are annual storage basins in river Lule, which makes it possible to adjust the tapping from a annual storage basin to the variations in water supply from one year to another.
- Parts of river Lule are expanded for power, which means that the tapping of water are adjusted to the need of temporary effect increases. The consequence is a more extensive influence on the environment. The environmental influence will then not be underestimated.
- Vattenfall is single owner which has made it easier to obtain data.

Transmission and distribution losses are not included. When the result is used to study different types of electricity use, these losses should be included. A rough estimate are that the distribution losses for a large industry customer are approximately 5% of the bought electricity, i.e. to obtain data for the use of electricity the data should be multiplied with 1,05. For an average household customer the transmission losses are approximately 10% of the bought electricity, i.e. the data should be multiplied with 1,10.

A large share of the *environmental influence associated with water power* are difficult to handle in a life cycle analysis. It is possible to make an inventory of the different types of influence, but difficult to assess quantitatively. The environmental influence are to a large extent direct and local, such as influence on the landscape and biological diversity.

The complete study include building, operation and maintenance, and demolition of the power plant. When the data is used for energy production in a life cycle analysis of a product or a system, that do not require expansion of the electricity production system, it however reasonable only to include operation and maintenance. The other phases of the life cycle are the same independent on the electricity production.

#### About Data

Data for the *power stations* are specific for the respective plant. The reported data are weighted averages of the use of resources and energy for operation of three hydro-electric power plants in river Lule: Seitevare with Tjaktjajaure annual storage basin, Harsprånget and Boden.

Relevant data for transports, extraction and production of metals and chemicals, and manufacture and work on important components were hard to obtain. Data from manufacturers and other reports and studies, primarily life cycle analyses have been used. Production of material and transports are considered with current technology. Swedish standard values have been used to calculate fuel use and emissions from transports. Transport distances are specific for the operation of the plant.

*The parameters that are presented* are chosen because they have a general interest and because the basis for these parameters are relatively good. All values are reported with 3 figures. The data are however seldom that accurate.

Use of materials and chemicals for *operation and reinvestments* of the power plants are generally assumed to give an addition of 1 % per year of the use of resources and emissions at the building phase. Dams, concrete constructions and buildings are however not considered to need to renewal during the lifetime of the power station. The following data has been used in the analysis (tonnes per year during 60 years):  
Seitevare: Steel 9,43; Copper 0,38; Lead 0,5; Sulphuric acid 0,22  
Harsprånget: Steel 71,3; Copper 3,1; Lead 1,17; Sulphuric acid 0,75  
Boden: Steel 9,02; Copper 0,24; Lead 0,58; Sulphuric acid 0,26

For electricity used in the manufacture of materials and

	<p>fuels, <i>average electricity</i> for the respective countries distributed on different electricity production alternatives have been used. The following <i>degrees of efficiencies</i> have been used to calculate the fuel used in the electricity production. The values are standard values for existing power plants. New modern plants have often higher degrees of efficiencies. The values are calculated from the effective heat value in the used fuels and the energy content in the steam produced in a nuclear power plant.</p> <ul style="list-style-type: none"> <li>• Coal condensing: 40%</li> <li>• Oil condensing: 40%</li> <li>• Natural gas condensing/combination: 40%</li> <li>• Gas turbine: 25%</li> <li>• Combined heat and power plant(irrespective of fuel) 30% (for electricity production) 85% (total for electricity and heat production)</li> <li>• Water power: are not recalculated, but are accounted for as kWh electricity</li> <li>• Nuclear power: 33%, are however not recalculated, but accounted for as kWh electricity or gram natural uranium.</li> </ul>
<p><b>Notes</b></p>	<p>There are several known and possible environmental effects at expansion of water power that cannot be quantitatively described:</p> <ul style="list-style-type: none"> <li>• Influence on the landscape, and a large influence on the area near a regulation reservoir.</li> <li>• A loss of biological diversity, because of large differences in water level before and after the expansion.</li> <li>• Displacement in the population of species influence e.g. the fishing.</li> <li>• The transport of important minerals to the sea are changed.</li> <li>• Roads have been built in mountain regions, which have both positive and negative effects.</li> <li>• Loss of land, and damages to the earth for agriculture.</li> <li>• A more even water flow has reduced the risk of flooding.</li> <li>• Influence on the reindeer breeding because of loss of land, obstruction of movement of reindeer herds etc.</li> </ul> <p>To reduce the negative effects, actions like biotope improvements and preservation of some water flow in the river have been used.</p> <p>Today, there are approximately 1000 hydro-electric power plants in Sweden. Most of them are small, 10-100 kW. More than 120 power plants have an effect larger than 20 MW. About 50% of the electricity produced in Sweden is from water power. The remaining share are predominately nuclear power. Of the electricity produced by water power, about 50% are produced in Vattenfall:s plants.</p> <p>The probability that the power stations will ever be demolished are small. A water power plant has low costs and running reinvestments and reconstruction will be done.</p>

# SPINE LCI dataset: Hydrogen fuel production by steam reforming of natural gas. ESA-DBP

<b>Availability</b>	Public

Technical System	
<b>Name</b>	Hydrogen fuel production by steam reforming of natural gas. ESA-DBP
<b>Functional Unit</b>	1 MJ of CGH2 (compressed hydrogen)
<b>Functional Unit Explanation</b>	Compressed hydrogen is the gaseous state of the element hydrogen which is kept under pressure. It can be used for mobile hydrogen storage in hydrogen vehicles. It is assumed that the final pressure of the hydrogen gas stored is 250 bar.
<b>Process Type</b>	Cradle to gate
<b>Site</b>	Unknown
<b>Sector</b>	Energyware
<b>Owner</b>	Unknown
<b>Technical system description</b>	<p>Hydrogen can be used as an energy source for fuel cell vehicles. The fuel cell consists of 3 main elements: cathode, anode and electrolyte. It can use hydrogen and oxygen to create electricity by an electro-chemical process.</p> <p>Excerpt from the report (see 'Publication'): "Hydrogen can be produced from many different sources (fossil hydrocarbons, biomass or water) using different technologies such as electrolysis, steam reforming or gasification.(...) Steam reforming is the most common production process today and the most cost-effective. Normally natural gas is used as the feedstock(...). The energy efficiency is about 75-80% for large scale reforming. If the process is combined with an efficient waste recovery, 85% might be reached."</p> <p>During the process "there will be energy losses in the reformer and compressor. However, since there is no need to compress the natural gas, the energy used for CNG (NB: compressed natural gas) pathway is reduced by 0.05MJ/MJ NG (NB: natural gas). The energy efficiency of the small-scale reformer is 79.8% based on LHV (NB: Lower Heating Value). (...) It is assumed that the final pressure of the hydrogen gas stored is 250 bar and the compression is done by NG-fuelled gas turbines (n=34%); the natural gas used is 0.14MJ/MJ compressed gas."</p> <p>There are 3 main steps of producing the hydrogen:</p> <ol style="list-style-type: none"> <li>1. NG pathway (exploration, extraction, distribution)</li> <li>2. Small scale reforming</li> <li>3. Compression natural gas fuelled</li> </ol> <p>This process is included in the system described in: Karlström M. (2002). Environmental Technology Assessment of Introducing Fuel Cell City Buses - A Case Study of Fuel Cell Buses in Göteborg. ESA report 2002:10, ISSN:1404-8167. Chalmers University of Technology. Gothenburg, Sweden. <b>Intended User</b>	LCA practitioner
<b>General Purpose</b>	Excerpt from the report (see 'Publication'): "The main goal is an environmental assessment of the use of fuel cell buses on bus route 60 in Göteborg. Environmental assessments involve the gathering, evaluation and synthesize of data and methods using engineering and scientific research to help address an environmental decision making situation. This assessment is made to decide whether to invest in a new technology for fuel cell buses by 2006 or to rely on other bus technologies. (...) The main goal is divided into 3 parts. the first goal of this study is to describe the technical system, methodology used, and frame of the problem. In the future when real investment decision will be made, this study could then help frame an actual investment decision. The second goal is to present environmental performance results for the different alternative bus technologies. The results address emissions, health effects, and financial investments. The third goal is to describe and assess the uncertainties of the results."
<b>Detailed Purpose</b>	Hydrogen is an energy source for a fuel cell and its production is presented in the reference report. Hydrogen production by steam reforming of a natural gas is the most cost-effective way of production. Determining the inventory data for this process is an important part of the study.
<b>Commissioner</b>	MISTRA - .

(...)</p> <p>Hydrogen from electricity by electrolysis is one of the most well-known and simplest methods to produce hydrogen. Only electricity and pure water is needed to produce extremely pure hydrogen. However only about 4% of the hydrogen produced today in the world is from electrolysis. (...). The major problem with electrolysis is the high cost of electricity when compared with steam reforming of natural gas in most countries. However there are benefits such as its flexibility, simplicity, reliability and purity of the product. Furthermore, the plant is locally non-polluting in itself and if the electricity is made from renewable source, such as hydropower, solar energy, or wind energy, then the potential for reduction of greenhouse gases is substantial. The electrolysis technology is modular in its design, making it possible to design the process over a wide range of scales from a few kilowatts to hundreds of megawatts. Three different technologies for water electrolysis are available. They differ depending on what kind of electrolyte is used. The most common and the only commercial alternative today is based on alkaline technology using liquid KOH as electrolyte. (...) The electrolyzers normally have efficiency [hydrogen output (HHV)/electricity input] 70-85% (NB: HHV - Higher Heating Value)."</p>

## SPINE LCI dataset: Hydrotreated Vegetable Oil - Palm oil, cradle-to-gate, system expansion - f3 fuels

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	2013-11-30
<b>Copyright</b>	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
<b>Availability</b>	Public

<b>Technical System</b>	
<b>Name</b>	Hydrotreated Vegetable Oil - Palm oil, cradle-to-gate, system expansion - f3 fuels
<b>Functional Unit</b>	1 MJ

<b>Functional Unit Explanation</b>	1 MJ Hydrotreated Vegetable Oil - Palm oil
<b>Process Type</b>	Cradle to gate
<b>Site</b>	
<b>Sector</b>	Fuel
<b>Owner</b>	
<b>Technical system description</b>	<p>Production (cradle to gate) of Hydrotreated Vegetable Oil (HVO), produced from Palm oil. The data is based on several data sources (see References) and based on data sets for each process step. An LCA model has been compiled within this f3 project (see Additional information). This data set is the result of this LCA model.</p> <p>Neste oil (Finland) produces HVO from palm oil, rape seed oil and from animal fat. The HVO sold on the market under the name NExBTL is a mix of HVO from these three raw materials. The mix varies, but in 2012 it was 64.5% from palm oil, 0.3% from rape seed, jathropa and camelina oil, as well as 35.1% from waste and residues (animal fat, waste fish processing fat, fatty acid from palm and stearin). The heat value for the HVO mix is 44.1 MJ/kg (4) and the average density is 780 kg/m<sup>3</sup> (4 &amp; 5).</p> <p>The LCA model was divided in three stages: agricultural stage, processing stage and HVO production. In every life cycle stage transportation is included.</p> <p>The LCA model includes direct affected processes, overhead (operation of buildings, administration, etc.) and capital goods (building, machinery and means of transportation). All electricity is assumed to be European average. Emissions of pesticides are assumed to be received by air (33%), soil (33%) and water (33%). Palm oil mill effluent (POME) is assumed to be treated in open anaerobic-aerobic ponds. Empty fruit bunches are applied as mulch in the plantation. The total amount of shells and fibers from palm fruits are assumed to be burned in boiler to produce steam and electricity. It is assumed that all palm kernel oil extraction takes place using mechanical extraction. The palm is grown, harvested and refined into crude oil in Malaysia.</p> <p>The fuel component is refined into the fuel product in Kilpilahti, Porvoo, Finland. Finally the fuel product is distributed to tank service stations in Finland.</p> <p>Omitted data:</p> <ul style="list-style-type: none"> <li>- The production of seeds during agricultural stage has been omitted;</li> <li>- Production of cypermethrin, warfarin and fungicides has been omitted;</li> <li>- Methane emissions from oil palm plantation have been omitted;</li> <li>- No capital goods or overhead for the HVO production facility is included in the model.</li> <li>- Chemicals used to treat POME are not accounted for.</li> <li>- Lubricating oil is omitted from the inventory of the processing stage.</li> </ul>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	
<b>Time Boundary</b>	2010 - 2013
<b>Geographical Boundary</b>	
<b>Other Boundaries</b>	
<b>Allocations</b>	No.
<b>Systems Expansions</b>	<p>System expansion for by-products and energy replacing other products and other energy. Processing stage: palm kernel cake substituting soybean meal from Brazil; fibres and shells burned in boiler substituting electricity from the grid (data for European average grid (UCTE) have been used) and sand at mine.</p> <p>HVO production: biogasoline substituting naphtha; fuel gas substituting natural gas.</p>

<b>About Data</b>	This dataset is the part of the results from the f3 project "Setup of f3 data network for Well-to-wheel (Method and) LCI data for fossil and renewable fuels in the Swedish market". Further details about this project can be found in the project report.
<b>Notes</b>	There are two well to tank data sets for HVO published within this f3 project; HVO from palm oil and rapeseed oil.

SPINE LCI dataset: Hydrotreated Vegetable Oil - Rapeseed oil, cradle-to-gate, system expansion - f3 fuels

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	2013-11-30
<i>Copyright</i>	f3 - Swedish Knowledge Centre for Renewable Transportation Fuels
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Hydrotreated Vegetable Oil - Rapeseed oil, cradle-to-gate, system expansion - f3 fuels
<i>Functional Unit</i>	1 MJ
<i>Functional Unit Explanation</i>	1 MJ Hydrotreated Vegetable Oil - Rapeseed oil
<i>Process Type</i>	Cradle to gate
<i>Site</i>	
<i>Sector</i>	Fuel
<i>Owner</i>	
<i>Technical system description</i>	<p>Production (cradle to gate) of Hydrotreated Vegetable Oil (HVO), produced from Rapeseed Oil.</p> <p>The data is based on several data sources (see References) and based on data sets for each process step. An LCA model has been compiled within this f3 project (see Additional information). This data set is the result of this LCA model.</p> <p>Neste oil (Finland) produces HVO from palm oil, rapeseed oil and from animal fat. The HVO sold on the market under the name NExBTL is a mix of HVO from these three raw materials. The mix varies, but in 2012 it was 64.5% from palm oil, 0.3% from rapeseed, jathropa and camelina oil, as well as 35.1% from waste and residues (animal fat, waste fish processing fat, fatty acid from palm and stearin). The heat value for the HVO mix is 44.1 MJ/kg (4) and the average density is 780 kg/m<sup>3</sup> (4 &amp; 5).</p> <p>The LCA model was divided in three stages: agricultural stage, processing stage and HVO production. In every life cycle stage transportation is included.</p> <p>The LCA model includes direct affected processes, overhead (operation of buildings, administration, etc.) and capital goods (building, machinery and means of transportation). Electricity in agricultural and processing stages is assumed to be Danish production mix, while in HVO production stage it is assumed to be European average (UCTE mix). It is assumed that 87% of the straw is left on the field, and 13% is used for energy purposes. Emissions of pesticides are assumed to be received by air (33%), soil (33%) and water (33%). Emissions generated by burning of straw are assumed to be equivalent to burning of softwood in furnace. Rapeseed oil is extracted by utilization of hexane as solvent. Residual rapeseed from screening process of incoming rapeseed is sent to biogas production. The rapeseed is grown, harvested and refined into crude oil in Denmark. Data for processing stage refers to AarhusKarlshamn refinery, in Aarhus, Denmark. The fuel component is refined into the fuel product in Kilpilahti, Porvoo, Finland. Finally the fuel product is distributed to tank service stations in Finland.</p> <p>Omitted data:</p> <ul style="list-style-type: none"> <li>- Magnesium, sulphur and boron fertilisers are not taken into account;</li> <li>- Dust emissions and soil erosion are omitted;</li> <li>- No indirect NO emissions from the field are accounted for;</li> <li>- Lubricating oil and cleaning agents are omitted from processing stage;</li> <li>- Recycling of paper, plastic, metals, lubricating oil, as well as waste to landfill are omitted from processing stage;</li> <li>- No capital goods or overhead for the HVO production facility is included in the model.</li> </ul>

System Boundaries

## About Inventory

### Publication

IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8.

-----  
Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden

Documentation reviewed by:  
Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden  
-----

### Intended User

LCA practitioners

### General Purpose

The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.

### Detailed Purpose

The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyvningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.

### Commissioner

Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .

### Practitioner

Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .

### Reviewer

CPM -

### Applicability

The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in "Represents" in QMetaData for each specific flow.

When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations:

- Biofuel electricity energy system, EPD-version
- Fuel gas electricity energy system, EPD-version
- Hydro electricity energy system, EPD-version
- Lignite electricity energy system, EPD-version
- Nuclear electricity energy system, EPD-version
- Oil electricity energy system, EPD-version
- Stone coal electricity energy system, EPD-version
- Wind electricity energy system, EPD-version

The following countries and regions have been documented in the database:

Australia, electricity generation mix 1998  
Austria, electricity generation mix 1998  
Belgium, electricity generation mix 1998  
Canada, electricity generation mix 1998  
Czech Republic, electricity generation mix 1998  
Denmark, electricity generation mix 1998  
European Union, electricity generation mix 1998  
Finland, electricity generation mix 1998  
France, electricity generation mix 1998  
Germany, electricity generation mix 1998  
Greece, electricity generation mix 1998  
Hungary, electricity generation mix 1998

## SPINE LCI dataset: Incineration of aluminium

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	1990
<b>Copyright</b>	
<b>Availability</b>	

<b>Technical System</b>	
<b>Name</b>	Incineration of aluminium
<b>Functional Unit</b>	1 kg
<b>Functional Unit Explanation</b>	The incineration of 1 kg aluminium.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	Sweden
<b>Technical system description</b>	Incineration of aluminium at a thermal energy plant, which uses waste as fuel.

<b>System Boundaries</b>	
<b>Nature Boundary</b>	The emissions to air are accounted for.
<b>Time Boundary</b>	
<b>Geographical Boundary</b>	
<b>Other Boundaries</b>	The energy extracted and the material used are accounted for.
<b>Allocations</b>	
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1990
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'
<b>Method</b>	The data are taken from RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<b>Literature Reference</b>	RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<b>Notes</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Refined resource	Aluminium	1			kg	Technosphere	Sweden
	Output	Emission	Ash	1899			g	Air	Sweden
<p>Method: Since it is difficult to say anything about the radical formation of the various materials, NO<sub>x</sub> formation has been assumed to be proportional to their heat content. This involves the assumption that the thermal NO<sub>x</sub> formation plays a more important role. Se notes.</p> <p>Notes: The emissions of NO<sub>x</sub> are more dependent on the technical aspects of incineration than the composition of the material. NO<sub>x</sub> are invariably formed during incineration. It may be formed from the nitrogen content of the fuel of the nitrogen in the combustion air. In the incineration of waste which has low contents of nitrogen, the formation of NO<sub>x</sub> mostly comes from the nitrogen in the air. The NO<sub>x</sub> is formed from the air in two different ways. 1. Immediate NO<sub>x</sub> formation from the nitrogen in the air at the front of the flame due to hydrocarbon radicals from fuel. The amount is fairly small during large-scale incineration and in most cases can be disregarded. 2. Thermal NO<sub>x</sub> formation starts at 900 degrees Celsius, but only becomes significant at 1200 degrees Celsius. The higher the temperature and the longer the flue gases remain in the high-temperature zone, the greater the NO<sub>x</sub> emissions. Referring to McKinsey &amp; Company, Inc. "Integrated substance chain management" (and appendix); Association of the Dutch Chemical Industry (VNCI); Leidschendam, The Netherlands; 1991.</p>	Output	Emission	NO <sub>x</sub>	4.90			g	Air	
	Output	Emission	Particulates	0.76			g	Air	
	Output	Product	Thermal energy	30.6			MJ	Technosphere

<b>Commissioner</b>	
<b>Practitioner</b>	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden.
<b>Reviewer</b>	

<b>Applicability</b>	<p>The data can be used, when one wants to estimate the emissions to air and the energy extracted, when 1 kg aluminium is incinerated at a thermal energy plant, that uses waste as fuel.</p> <p>The data are valid for Swedish conditions, but can be used as an approximation to other countries. One should though be aware of the fact that the situation in other countries may be very different and depending on this get one gets an unreliable result.</p> <p>The data are based on old sources and should therefore not be regarded as information describing the current situation.</p> <p>It is difficult to use the data in a correct way, because so little information is given about the system.</p>
<b>About Data</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

## SPINE LCI dataset: Incineration of biological household waste. ESA-DBP

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2006-2007
<b>Copyright</b>	Environmental Systems Analysis, Chalmers Univ. of Technology
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Incineration of biological household waste. ESA-DBP
<b>Functional Unit</b>	1 ton of biological household waste
<b>Functional Unit Explanation</b>	The functional unit is 1 ton of dry substance biological household waste.
<b>Process Type</b>	Gate to grave
<b>Site</b>	RenovaSävenäs, Sweden
<b>Sector</b>	Waste treatment
<b>Owner</b>	RenovaSävenäs, Sweden
<b>Technical system description</b>	<p>The household waste is combusted in an oven, which produces steam that runs a turbine with a generator and a pressure condenser for production of electricity and district heating. The total combustion capacity is 59 tons of waste per hour. Moisture content in the waste is in average 32 %.</p> <p>The smoke and gases that are produced by the combustion are carried off via an exhaust steamboiler to a treatment plant including several steps.</p> <p>Translated excerpts from the report (see 'Publication'):</p> <p>"The alternative to digestion of the waste is incineration in the power plant in Gothenburg. The transport to the incineration plant is executed with large lorries á 30 tons waste per each. At the plant heat and electricity are extracted from the incinerated waste. In this alternative case artificial fertilizer replaces the bio fertilizer and petrol and diesel replaces the vehicle gas."</p> <p>Processes included in the incineration system:</p> <ul style="list-style-type: none"> <li>- Incineration plant</li> <li>- Waste transport, one-way</li> <li>- Petrol in light vehicles</li> <li>- Diesel in heavy vehicles</li> <li>- Production of artificial fertilizer</li> </ul> <p>Processes not included in the incineration system:</p> <ul style="list-style-type: none"> <li>- Electricity use at the plant</li> <li>- Ashes and slag</li> </ul>

	<ul style="list-style-type: none"> <li>- Transport of artificial fertilizer</li> <li>- Use of chemicals</li> </ul> <p>This process is included in the system described in: Ljungkvist H, 2008, Miljö- och samhällsekonomisk analys av behandling av biologiskt avfall. Environmental Systems Analysis report 2008:1, Chalmers University of Technology, Gothenburg, Sweden</p> <p>Link to pdf (in Swedish): <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2008--1.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2008--1.pdf</a></p> <p>Other processes in the CPM Database also included in the above publication: 'Anaerobic digestion of biological household waste. ESA-DBP'</p>
--	---

System Boundaries	
<b>Nature Boundary</b>	Not applicable.
<b>Time Boundary</b>	The documentor makes a qualified guess that the data was produced in the years 2006-2007, based on information in the report.
<b>Geographical Boundary</b>	<p>The incineration plant is located in Sävenäs, Gothenburg, Sweden</p> <p>Translated excerpts from the report (see 'Publication'): "Only emissions from one-way transport are allocated to the incineration alternative, since the cars often have other commissions on the way back. One-way distance is 110 kilometers."</p>
<b>Other Boundaries</b>	<p>Translated excerpts from the report (see 'Publication'): "The alternative to digestion of the waste is incineration in the power plant in Gothenburg. The transport to the incineration plant is executed with large lorries at 30 tons waste per each. At the plant heat and electricity are extracted from the incinerated waste. In this alternative case artificial fertilizer replaces the bio fertilizer and petrol and diesel replaces the vehicle gas."</p> <p>Processes included in the incineration system:</p> <ul style="list-style-type: none"> <li>- Incineration plant</li> <li>- Waste transport, one-way</li> <li>- Petrol in light vehicles</li> <li>- Diesel in heavy vehicles</li> <li>- Production of artificial fertilizer</li> </ul> <p>Processes not included in the incineration system:</p> <ul style="list-style-type: none"> <li>- Electricity use at the plant</li> <li>- Ashes and slag</li> <li>- Transport of artificial fertilizer</li> <li>- Use of chemicals</li> </ul>
<b>Allocations</b>	Not applicable.
<b>Systems Expansions</b>	For comparison with the anaerobic digestion alternative emissions from production of artificial fertilizer and production of petrol and diesel are included.

## About Inventory

<b>Publication</b>	<p>Ljungkvist H, 2008, Miljö- och samhällsekonomisk analys av behandling av biologiskt avfall. Environmental Systems Analysis report 2008: 1, Chalmers University of Technology, Gothenburg, Sweden</p> <p>Link to pdf (in Swedish): <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2008--1.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2008--1.pdf</a></p>
<b>Intended User</b>	LCA practitioners and employees at Ragn-Sells.
<b>General Purpose</b>	<p>Master Thesis.</p> <p>Excerpt from the report (see 'Publication'):</p> <p>"Biogas is a renewable fuel that can be extracted from anaerobic digestion of many different substrates, for example biological household waste. An alternative handling of the waste is to mix it with other wastes and incinerate it in a combined heat and power (CHP) plant. This study uses life cycle assessment to investigate which type of waste handling that is better from an environmental point of view, anaerobic digestion with biogas production or incineration. The results are based on a case study of a biogas production plant owned by the company Ragn-Sells in Vänersborg. The alternative is incineration at a CHP plant in Gothenburg."</p>
<b>Detailed Purpose</b>	These are the data for the combustion process.
<b>Commissioner</b>	Ragn-Sells - .
<b>Practitioner</b>	Ljungkvist, Hanna - .
<b>Reviewer</b>	Palme, Ulrika -
<b>Applicability</b>	For applicability for the process see 'Technical System' and 'System Boundaries'.
<b>About Data</b>	<p>Translated excerpts from the report (see 'Publication'):</p> <p>"The transport to the incineration plant is executed with large lorries á 30 tons waste per each."</p> <p>"Emission data from fertilizer production is based on LCA data from Berglund and Börjesson (2003)."</p> <p>NB: Whole reference can be found in the publication.</p> <p>"For emissions from the incineration plant, used data is from tables in Baumann and Tillman (2004) for incineration of biological household waste. In reality this waste is mixed with other fractions before incineration."</p> <p>NB: Whole reference can be found in the publication.</p> <p>The power plant produces its own electricity.</p> <hr/> <p>ESA Database Project. # SPINE LCI dataset: Incineration of corrugated board

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1990
<i>Copyright</i>	
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Incineration of corrugated board
<i>Functional Unit</i>	1 kg
<i>Functional Unit Explanation</i>	The incineration of 1 kg corrugated board.
<i>Process Type</i>	Gate to gate
<i>Site</i>	Sweden
<i>Sector</i>	Grid electricity and district heat
<i>Owner</i>	Sweden
<i>Technical system description</i>	Incineration of corrugated board at a thermal energy plant, which uses waste as fuel.

System Boundaries	
<i>Nature Boundary</i>	The emissions to air are accounted for.
<i>Time Boundary</i>	
<i>Geographical Boundary</i>	
<i>Other Boundaries</i>	The energy extracted and the material used are accounted for.
<i>Allocations</i>	
<i>Systems Expansions</i>	

Flow Data	
General Activity QMetadata	
<i>Date Conceived</i>	1990
<i>Data Type</i>	Derived, unspecified
<i>Represents</i>	See 'Function'.
<i>Method</i>	The data are taken from RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<i>Literature Reference</i>	RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<i>Notes</i>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

Flow Table and Specific Meta Data									
QMetadata	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
Notes: Moisture content 15%	Input	Refined resource	Corrugated board	1			kg	Technosphere	Sweden
	Output	Emission	Ash	19.998			g	Air	Sweden
Method: Since it is difficult to say anything about the radical formation of the various materials, NOx formation has been assumed to be proportional to their heat content. This involves the assumption that the thermal NOx formation plays a more important role. See notes. Notes: The emissions of NOx are more									
	Output	Emission	NOx	2.67			g	Air	

dependent on the technical aspects of incineration than the composition of the material. NOx are invariably formed during incineration. It may be formed from the nitrogen content of the fuel or the nitrogen in the combustion air. In the incineration of waste which has low contents of nitrogen, the formation of NOx mostly comes from the nitrogen in the air. The NOx is formed from the air in two different ways. 1. Immediate NOx formation from the nitrogen in the air at the front of the flame due to hydrocarbon radicals from fuel. The amount is fairly small during large-scale incineration and in most cases can be disregarded. 2. Thermal NOx formation starts at 900 degrees Celsius, but only becomes significant at 1200 degrees Celsius. The higher the temperature and the longer the flue gases remain in the high-temperature zone, the greater the NOx emissions. Referring to McKinsey & Company, Inc. "Integrated substance chain management" (and appendix); Association of the Dutch Chemical Industry (VNCI); Leidschendam, The Netherlands; 1991.								
Method: The material-specific particulate emission depends on the ash content of each material. The residues consist of 10% fly ash, while 90% is bottom slag. The separation rate used for particulate is 99,6%. The figures have been decided through personal communication with Carl-Arne Pedersen and Christer Lundgren, Savenäs waste heat plant, GRAAB, Göteborg	Output	Emission	Particulates	0.008			g	Air
	Output	Product	Thermal energy	16.7			MJ	Technosphere

<b>Practitioner</b>	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden.
<b>Reviewer</b>	
<b>Applicability</b>	The data can be used, when one wants to estimate the emissions to air and the energy extracted, when 1 kg corrugated board is incinerated at a thermal energy plant, that uses waste as fuel.  The data are valid for Swedish conditions, but can be used as an approximation to other countries. One should though be aware of the fact that the situation in other countries may be very different and depending on this get one gets an unreliable result.  The data are based on old sources and should therefore not be regarded as information describing the current situation.  It is difficult to use the data in a correct way, because so little information is given about the system.
<b>About Data</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

<b>Practitioner</b>	Tillman, Anne-Marie - Technical Environmental Planning Chalmers University of Technology 412 96 Göteborg Sweden.

<b>Reviewer</b>	
<b>Applicability</b>	<p>The data can be used, when one wants to estimate the emissions to air and the energy extracted, when 1 kg polystyrene is incinerated at a thermal energy plant, that uses waste as fuel.</p> <p>The data are valid for Swedish conditions, but can be used as an approximation to other countries. One should though be aware of the fact that the situation in other countries may be very different and depending on this get one gets an unreliable result.</p> <p>The data are based on old sources and should therefore not be regarded as information describing the current situation.</p> <p>It is difficult to use the data in a correct way, because so little information is given about the system.</p>
<b>About Data</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

## SPINE LCI dataset: Incineration of PVC

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	1990
<b>Copyright</b>	
<b>Availability</b>	

<b>Technical System</b>	
<b>Name</b>	Incineration of PVC
<b>Functional Unit</b>	1 kg
<b>Functional Unit Explanation</b>	The incineration of 1 kg PVC.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	Sweden
<b>Technical system description</b>	Incineration of PVC at a thermal energy plant, which uses waste as fuel.

<b>System Boundaries</b>	
<b>Nature Boundary</b>	The emissions to air are accounted for.
<b>Time Boundary</b>	
<b>Geographical Boundary</b>	
<b>Other Boundaries</b>	The energy extracted and the material incinerated are accounted for.
<b>Allocations</b>	
<b>Systems Expansions</b>	

<b>Flow Data</b>
------------------

General Activity QMetadata	
<b>Date Conceived</b>	1990
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	The data are taken from RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<b>Literature Reference</b>	RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<b>Notes</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

Flow Table and Specific Meta Data									
QMetadata	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
	Input	Refined resource	PVC	1			kg	Technosphere	Sweden
	Output	Emission	Ash	554.4			g	Air	Sweden
Method: The material-specific emission factor for CO2 has been calculated on the basis of elementary analysis.	Output	Emission	CO2	1407			g	Air	Sweden
Method: The material-specific emission factor for HCl has been calculated on the basis of elementary analysis.	Output	Emission	HCl	29.2			g	Air	Sweden
Method: Since it is difficult to say anything about the radical formation of the various materials, NOx formation has been assumed to be proportional to their heat content. This involves the assumption that the thermal NOx formation plays a more important role. See notes. Notes: The emissions of NOx are more dependent on the technical aspects of incineration than the composition of the material. NOx are invariably formed during incineration. It may be formed from the nitrogen content of the fuel or the nitrogen in the combustion air. In the incineration of waste which has low contents of nitrogen, the formation of NOx mostly comes from the nitrogen in the air. The NOx is formed from the air in two different ways. 1. Immediate NOx formation from the nitrogen in the air at the front of the flame due to hydrocarbon radicals from fuel. The amount is fairly small during large-scale incineration and in most cases can be disregarded. 2. Thermal NOx formation starts at 900 degrees Celsius, but only becomes significant at 1200 degrees Celsius. The higher the temperature and the longer the flue gases remain in the high-temperature zone, the greater the NOx emissions. Referring to McKinsey & Company, Inc. "Integrated substance chain management" (and appendix); Association of the Dutch Chemical Industry (VNCI); Leidschendam, The Netherlands; 1991.	Output	Emission	NOx	2.88			g	Air	
	Output	Product	Thermal energy	18			MJ	Technosphere

## SPINE LCI dataset: Inductor assembly

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	2000-03-13
<b>Copyright</b>	Ericsson
<b>Availability</b>	Official

<b>Technical System</b>	
<b>Name</b>	Inductor assembly
<b>Functional Unit</b>	One gram inductor intended for surface mounting
<b>Functional Unit Explanation</b>	<p>The motivation for choosing this functional unit is:</p> <ul style="list-style-type: none"> <li>· Suitable unit to work with in an LCA of a private branch exchanges (a complicated telecom product)</li> <li>· Important component of the MD110 product system and many other electronic products.</li> </ul> <p>DESIGN</p> <p>These facts are based on Ericsson technical specification of the component.</p> <p>Ericsson product number: REG 707 0119/3 Ericsson description: Miniature chip choke</p> <p>Chokes are examples of components with the same electrical function as inductors and transformers.</p> <p>GENERAL</p> <p>Miniature chip choke intended for automatic mounting and all soldering methods.</p> <p>MECHANICAL DATA</p>

	<p>Design:</p> <p>The chip choke is flame retardant encapsulated with high-temperature resistant copper winding and a cube-shaped core made of ferrite.</p> <p>Terminals:</p> <p>Design 1, Silver plated solder terminals Design 2, Terminals with tin plated brass.</p> <p>Dimensions:</p> <p>Height: 4.5 mm, Length: 3.2 mm, Width: 3.2 mm Weight: app. 0,12 g</p>
<b>Process Type</b>	Gate to gate
<b>Site</b>	Not relevant
<b>Sector</b>	Manufacturing
<b>Owner</b>	Not relevant
<b>Technical system description</b>	<p>This activity includes the final assembly of an inductor. The activity is based on information acquired from one manufacturer. The description of the process is assumed to be general for this type of manufacture. The following process steps are included;</p> <ol style="list-style-type: none"> <li>1. Core mounting</li> <li>2. Epoxy-curing</li> <li>3 Winding</li> <li>4. Welding</li> <li>5. Molding</li> <li>6. Marking</li> <li>7. Bending</li> <li>8. Testing</li> <li>9. Final control</li> <li>10. Taping</li> </ol> <p>Details given:</p> <ol style="list-style-type: none"> <li>1. Core mounting: Cores inserted into leadframe and fixed by adhesive (epoxy resin) emission negligible</li> <li>3. Winding: 3 % of magnet wire recycled</li> <li>4. Welding: Winding ends connected to the leads by ultrasonic welding</li> <li>5. Molding: Abundant PPS is reused , scrapped PPS thermally decomposed</li> <li>7. Bending: Abundant leadframe ist recycled</li> <li>8. Testing: 100 %; scrap &lt;1 %</li> </ol> <p>Additional information:</p> <p>Below is some additional information supplied by the component manufacturer.</p> <p>Our description of the component is a FR choke of type wound SMT choke. Chokes are similar to inductors. The annual production (97/98) was 25,000,000. In the factory also capacitors, other inductors and filters are produced. The general description is: Production of passive components with no environmental problems. Planned changes in production rate is that a second line with higher output for the component is in discussion.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	The emissions to air have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impact has been studied. Emissions to water and soil are excluded due to lack of data.
<b>Time Boundary</b>	1998 The answer from the manufacturer arrived in 1998 and they measured in 1998. The process technology used is most certainly the best available as the factory is located in western Germany and the company is well established.
<b>Geographical Boundary</b>	The technical system for this model is limited to the factory where the production takes place. The manufacturer is located in Germany.
<b>Other Boundaries</b>	Delimitation's to the system is the final step in the making of the inductor. The production of the subparts (e.g. Fe3O4, Copper magnet, CuSn6 and PPS) of the inductor is not included in this model. The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability.

<b>Allocations</b>	<p>The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory.</p> <p>The electricity consumption per component is well ascertained by the manufacturer.</p>
<b>Systems Expansions</b>	None.

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1998
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The data that is presented is calculated based on information from one component manufacturer. The information from the manufacturer was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: -The amount of each flow per functional unit is calculated for the component manufacturer. In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n. Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1. For CM1 sum <math>AC1 + \dots + ACn</math> Step 2: The sum <math>AC1 + \dots + ACn = W1</math> Step 3: Divide all flows between <math>M11 \dots M1n</math> by <math>W1 \rightarrow N11 \dots N1n</math> Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow.</p>
<b>Literature Reference</b>	RVF: "Svensk avfallshantering 1990", Malmö, November 1990.
<b>Notes</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

Date conceived: 1998 Data type: Derived, unspecified Method: CM: 8 mg/166.6 mg = 0.048 g Sn/g (stated as Tin in original answer)	Input	Refined resource	Sn	0.048			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM: 3 mg/166.6 mg = 0.018 g Solder/g (stated as Solder in original answer)	Input	Refined resource	Solder	0.018			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Inductor (REG 707 0119/3) manufacturer states an emission of 0,07 mg SO2/COS for one inductor which weighs 0,1666 grams. I assume a 0,035 mg emission of SO2 and a 0,035 mg emission of COS. Hence, 0,035e-3/0,1666 = 2,1e-4 g COS g / g inductor COS is Carbonyl Sulfide	Output	Emission	Carbonyl sulfide	0.00021			g	Air	
Date conceived: 1998 Data type: Derived, unspecified Method: Inductor (REG 707 0119/3) manufacturer states an emission of 0,82 mg for one inductor which weighs 0,1666 grams. Hence, 0,82e-3/0,1666 = 4,92e-3 g CO2 / g inductor	Output	Emission	CO2	0.0049			g	Air	
Date conceived: 1998 Data type: Derived, unspecified Method: Inductor (REG 707 0119/3) manufacturer states an emission of 0,006 mg for one inductor which weighs 0,1666 grams. Hence, 0,006e-3/0,1666 = 3,6e-5 g / g inductor	Output	Emission	Hardener	0.000036			g	Air	
Date conceived: 1998 Data type: Derived, unspecified Method: Inductor (REG 707 0119/3) manufacturer states an emission of 0,07 mg SO2/COS for one inductor which weighs 0,1666 grams. I assume a 0,035 mg emission of SO2 and a 0,035 mg emission of COS. Hence, 0,035e-3/0,1666 = 2,1e-4 g SO2 g / g inductor	Output	Emission	SO2	0.00021			g	Air	
Date conceived: 1999 Data type: Derived, unspecified Method: Inductors = Life Cycle Inventory Model for production of one gram of inductors and transformers (applicable at least for telecommunication equipment)	Output	Product	Inductors	1			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM: 3 mg/166.6 mg = 0.018 g Ag/g (stated as Silver in original answer) Notes: 100 % by mass of the silver waste is recycled.	Output	Residue	Ag	0.018			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM: 280 mg/166.6 mg = 1.68 g PPS/g (stated as Polyphenyleneoxide in original answer) Notes: 100 % by mass of the PPS waste is recycled.	Output	Residue	Polyphenyl sulphide	1.7			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM: 4 mg/166.6 mg = 0.024 g Sn/g (stated as Tin in original answer) Notes: 100 % by mass of the tin waste is recycled.	Output	Residue	Sn	0.024			g	Technosphere	

## About Inventory

<b>Publication</b>	<p>Not available</p> <p>-----</p> <p>Data documented by: Anders Andrae, Ericsson Business Networks AB</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	The intended use for this LCI
<b>General Purpose</b>	<p>The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks.</p> <p>The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system.</p> <p>The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB.</p> <p>Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts.</p> <p>The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems.</p> <p>Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson.</p> <p>The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.</p>
<b>Detailed Purpose</b>	<p>Map an inductor assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of inductors and resembling components in our telecom products.</p> <p>The usage for this set of data is life cycle assessments where inductors intended for surface mounting are part of the studied system.</p> <p>Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX.</p> <p>The division into component groups is based on structural resemblance, electrical function and material contents of the different components.</p> <p>-----</p> <p>Below is a list of the component groups and corresponding models that have been compiled:</p> <ol style="list-style-type: none"> <li>1. Cables - Model: Cable assembly</li> <li>2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly</li> <li>3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly</li> <li>4. Connectors and holders - Model: Connector assembly</li> <li>5. Diodes - Model: Diode wafer production and assembly</li> <li>6. Display units and indicators - Model: Liquid crystal display assembly</li> <li>7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked)</li> <li>8. Other - Model: "Other" electronic component assembly</li> <li>9. Potentiometers - Model: Potentiometer assembly</li> <li>10. Printed boards - Model: Printed board assembly</li> <li>11. Relays - Model: Relay assembly</li> </ol>

	<p>12. Resistor networks - Model: Resistor network assembly</p> <p>13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly</p> <p>14. Resistors; surface mounted devices - Model: Resistor for surface mounting assembly</p> <p>15. Transformers and inductors - Model: Inductor assembly</p> <p>16. Transistors and opto couplers (2 models) - Models: 1. Transistor assembly and 2. Si wafer production and Si wafer processing for transistors (these models are interlinked)</p>

<b>Applicability</b>	<p>This set of data can be applied to inductors intended for hole mounting in electronic equipment if you know how much the inductors weigh. The model is also intended to be representative for transformers in electronic equipment.</p> <p>-- Transports. --</p> <p>Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model.</p> <p>CM1 = Component manufacturer one</p> <p>The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport.</p> <p>-- Truck transportation: --</p> <p>Weight of component: 0.166 g</p> <p>Fe3O4 with weight 0.045 g is transported 1300 km by truck, i.e. <math>0.045 * 1300</math> km, Copper magnet <math>0.04 * 1500</math>, PPS <math>0.35 * 2000</math>, (CuSn6) <math>0.012 * 2700</math> Solder <math>0.003 * 1700</math></p> <p>The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:</p> <p><math>856.9 \text{ gkm} / 0.166 \text{ g} = 5162 \text{ gkm/g}</math></p> <p>-- Boat transportation: --</p> <p>Fe3O4 with weight 0.045 g is transported 20,000 km by boat, i.e. <math>0.045 * 20,000</math> km, Copper magnet <math>0.04 * 500</math>, PPS <math>0.35 * 500</math>, (CuSn6) <math>0.012 * 500</math> Solder <math>0.003 * 500</math></p> <p>The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:</p> <p><math>1102.5 / 0.166 = 6641.57 \text{ gkm /g}</math></p>
<b>About Data</b>	<p>The data is based on information from one German manufacturer. The information was gathered using a life cycle inventory questionnaire.</p> <p>The figures in the original answer from the manufacturer should all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so.</p> <p>The result is that approximately 78 % of the flows stated by the manufacturer were only calculated and 22 % were only estimated.</p> <p>The outline of the LCI data questionnaire that was used in the inventory follows below. No limitations or specifications were set for which substances they had to account</p> <p>-- LCI data questionnaire --</p> <p>Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km).</p> <p>We here only asked for flows exceeded 2% by weight of the material declaration of the</p>

	<p>component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.</p> <p>Process description.</p> <p>Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (E.g. planned changes in production rate)</p> <p>Material, components and natural resource input, etc. We told them to express data in amount per functional unit.</p> <p>Name of material, component or resource. Used amount (mg). Amount In Product (mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production sites (address). Suppliers of transport (address). Additional information.</p> <p>Emissions.</p> <p>Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information.</p> <p>Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information.</p> <p>Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information.</p> <p>Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.</p>

## SPINE LCI dataset: Integrated circuit capsule assembly

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2000-03-03
<b>Copyright</b>	Ericsson
<b>Availability</b>	Official

Technical System	
<b>Name</b>	Integrated circuit capsule assembly
<b>Functional Unit</b>	One gram of integrated circuit capsule.
<b>Functional Unit Explanation</b>	<p>The motivation for choosing this functional unit is:</p> <ul style="list-style-type: none"> <li>· suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product)</li> <li>· important component of the MD110 product system and many other electronic products.</li> </ul> <p>DESIGN</p>

	<p>The answers from component manufacturer one (CM1) and component manufacturer three (CM3) are for exactly the same type of component. Component manufacturer one (CM2) produces prototype capsules of an other kind of IC. These facts are based on Ericsson technical specification of the component.</p> <p>Ericsson product number: RYT 304 0164/C Ericsson description of the integrated circuit capsule: Microcircuit, HCMOS, 8 bit shift register</p> <p>General technical specification</p> <p>The circuit consists of an eight bit parallel-out serial shift register. All outputs standard type. Representative type: 74HC164</p> <p>Small out line package (SO) with 14 terminals and 4.90 mm nominal width.</p> <p>Dimensions: capsule size SOP14 Weight: about 0.135 grams Silicon chip area: 2.3 mm<sup>2</sup></p> <p>The size of the circuits varies depending on chip size, and number of terminals of the leadframe. Large importance has also the type of capsule.</p> <p>Important measures for the capsule type Small Outline Package (SOP) and Plastic Lead Chip Carrier (PLCC) are in this range:</p> <p>Total package height (mm): 4,19 - 5,08 (for PLCC) Terminal thickness (mm): 0,19-0,32 (for SOP) Total body lenght including terminals (mm): 9,77-30,36 (for PLCC) Total package width including terminals (mm): 5,8-10,65 (for SOP) Total number of terminals (mm): 20-84 (for PLCC)</p>
<b>Process Type</b>	Gate to gate
<b>Site</b>	Not relevant
<b>Sector</b>	Manufacturing
<b>Owner</b>	Not relevant
<b>Technical system description</b>	<p>This activity includes the final encapsulation assembly of an integrated circuit capsule. The activity is an average based on information acquired from three manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included;</p> <ol style="list-style-type: none"> <li>1. Wafer Mounting</li> <li>2. Wafer Sawing</li> <li>3. Die Attach (die bonding onto a leadframe)</li> <li>4. Snap Cure</li> <li>5. Wire Bonding</li> <li>6. Molding</li> <li>7. Post Mold Cure</li> <li>8. Deflashing</li> <li>9. Plating (Solder- or tin)</li> <li>10. Cropping&amp;Laser Marking</li> <li>11. Testing</li> <li>12. Tape &amp; Reel</li> <li>13. Labelling&amp;Packing</li> </ol> <p>No detailed description was given by manufacturer one, two or three. The transports between the wafer fab and the final capsule production are not included.</p>

## System Boundaries

<b>Nature Boundary</b>	The emissions to air and water have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impacts have been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used.
------------------------	--

<b>Time Boundary</b>	1997-1998 The information from CM1 and CM2 is from 1997 and the answer from the manufacturer three (CM3) arrived in 1998 and they measured in 1998. The process technology used is most certainly the best available as the factories are located in the Netherlands, Sweden and Malaysia and the companies are well established.
<b>Geographical Boundary</b>	The technical system for this model is limited to the factory where the production takes place. The manufacturers included in the average are located in the Netherlands, Sweden and Malaysia.
<b>Other Boundaries</b>	Delimitations to the system is the final encapsulation assembly of an integrated circuit (IC). The production of the sub-components (e.g. lead frame, Au-wire) needed to produce the final IC is not included. The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability.
<b>Allocations</b>	The manufacturers have not described how the allocation has been made. We did not decide or have any suggestions on how the manufacturer should allocate in their factory.
<b>Systems Expansions</b>	None.

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1998
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	The data that are presented are calculated as a average based on information from three component manufacturers. The information from the manufacturers was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1: For CM1 sum $AC1 + \dots + ACn$ Step 2: The sum $AC11 + \dots + ACyn = W1$ Step 3: Divide all flows between $M11 \dots M1n$ by $W1 \rightarrow N11 \dots N1n$ Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum $N1n + \dots Nyn$ and divide by the number of terms for each unique flow. ( material input, emission etc.) An average calculation like above of up to three answers was made.
<b>Literature Reference</b>	Literaturreferences or contact persons aided the data compilation: . Jens Malmodin, Ericsson Radio Systems
<b>Notes</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of informaiton is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

<b>Applicability</b>	<p>This set of data can be applied to integrated circuits (i.e. IC ´s) in electronic equipment if you know the total weight of the IC ´s. The model is intended to be representative for microcircuits, oscillators, quartz crystal units and delay lines in electronic equipment.</p> <p>-- Transports--</p> <p>Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model.</p> <p>CM1 = Component manufacturer one</p> <p>The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport.</p> <p>-- Truck transportation: --</p> <p>Component manufacturer one (CM3):</p> <p>Weight of component: 0.119 g</p> <p>Silicon die with weight 0.0015 g is transported 10 km by road i.e. 0.0015 g*10 km, Lead frame 0.05 g*10 km, Wires 0.0025 g*350 km, Filled epoxy resin 0.062 g*350 km and Solder 0.006 g*250 km.</p> <p>The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:</p> <p><math>24.59 \text{ gkm} / 0.119 \text{ g} = 206.63 \text{ gkm/g}</math></p> <p>-- Airplane transportation: --</p> <p>Silicon die with weight 0.0015 g is transported 10000 km by air i.e. 0.0015 g*10000 km</p> <p>This gives:</p> <p><math>15 \text{ gkm} / 0.119 \text{ g} = 126.05 \text{ gkm/g}</math></p>
<b>About Data</b>	<p>The data is based on information from three manufacturers. The information was gathered using a life cycle inventory questionnaire (CM2 and CM3) and brochures (CM1). CM1 answered with a brochure when asked to fill in the questionnaire.</p> <p>All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model.</p> <p>Of the flows about little more than 85 % are not average values. The flows for Energy input of Electricity, Raw material inputs of PP and Sn/Pb plating and Waste output of Sn/Pb plating are average values.</p> <p>In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included.</p> <p>The figures in the original answer from the manufacturers all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so. Only in one source (CM3) this information was given.</p> <p>The result is that approximately 35 % of the flows were only calculated and 65 % were only estimated.</p> <p>All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model.</p>

	<p>These flows were asked for and no limitations were set for which substances for which they had to account.</p> <p>Transport description: Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km).</p> <p>We here only asked for flows exceeded 2% by weight of the material declaration of the component. Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.</p> <p>Process description.</p> <p>Description of the entire production at the plant/site and a technical description of the plant production. Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation. Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured. General LCA-related information on the production system (Allocation procedures, system boundaries, etc.). Additional information. (e.g. planned changes in production rate)</p> <p>Material, components and natural resource input, etc. We told them to express data in amount per functional unit.</p> <p>Name of material, component or resource. Used amount(mg). Amount In Product(mg). Additional information Energy-ware input Energy -ware source. Quantity/functional unit. Unit. Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information.</p> <p>Emissions.</p> <p>Emissions to air. Indicate whether emissions from energy use are included in the data. Name of emission to air. Emission to air/functional unit (mg). Additional information.</p> <p>Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient. Name of emission to water. Emission to water/functional unit (mg). Additional information.</p> <p>Emissions to soil. Name of emission to soil. Emission to soil/functional unit (mg). Additional information.</p> <p>Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.</p>

## SPINE LCI dataset: Inventory of Volvo painting plant, TB4

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-10-21
<b>Copyright</b>	Chalmers University of Technology
<b>Availability</b>	Public.
Technical System	
<b>Name</b>	Inventory of Volvo painting plant, TB4
<b>Functional Unit</b>	"one produced coach at TB4 during 1994"

<b>Functional Unit Explanation</b>	A "coach" in this report is a coach from the Volvo 800- or 900-series. TB4 is one of Volvo Car Corporation's painting plant.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Torslanda (Gothenburg)
<b>Sector</b>	Manufacturing
<b>Owner</b>	Torslanda (Gothenburg)
<b>Technical system description</b>	<p>Technology descriptor: In this study, an inventory is performed on the painting process for Volvo Car Corporation's painting plant in Torslanda (Gothenburg), TB4. The following processes are done in TB4: filling, surface coatings, waste treatment, including touch-up of coatings and energy production. Detailed description follows below.</p> <p>Technical content and functionality: FILLING - Before the coach is coated, an undercoating of the chassis is done as a stone-protective device. Next, there is a finish grinding before the first coating is applied. Finish grinding is done to give the coach a smoother surface. The coach is washed and goes through a water-drying furnace.</p> <p>SURFACE COATING - Three layers of coating is applied on each coach: filler-, clear- and base coating. First the filler coating is applied as a protection layer. Thereafter the base coat is applied which contains the colour pigment. Finally a layer of clear coat is applied as a top protection layer. Filler coat, clear coat and base coat-solid are applied with a rotating decompositioner that rotates very fast and thereby finely disperse the paint. 80-85% of the colour sticks to the coach, the rest is removed with the water in the air cleaner, the so-called curtain water and goes out of the system as sludge. The base coat-metallic is applied in two layers. The first is applied with a rotating decompositioner. The second layer is applied with an air sprayer that uses compressed air to finely disperse the paint. Only 40-45% of the paint sticks to the coach. It gives a different nuance using two methods to apply the base coat-metallic, compared to using only the rotating decompositioner.</p> <p>Every layer of coating is preceded and followed by heating, cooling and coat control. The air-heating furnace is powered either by natural gas or by electricity. The hardening furnace that follows after the filler- and clear coating steps have a temperature of 130° C. The IR-dryer follows the base coating step. It consists of one IR-part (radiation dryer) and one pre-dryer; together they expel the water out of the coat-dispersion. In this step the temperature is about 80° C. After the washing, the coach is drained from water and then goes through a water-dryer (approximately 100-120° C). After every furnace there is a cooler, where the coach is cooled with air to room temperature. In between each coating the coach passes through a furnace, followed by a cooling step and finally a washing step.</p> <p>WASTE TREATMENT - In the coating boxes there is a lattice floor. The air in the boxes is sucked down the floor and goes through the water, which is under the lattice. The colour particles are dispersed in the water and give rise to sludge together with sludge chemicals. The air is cleaned further if the coating is containing solvents. The final cleaning of air, containing solvents, is done in the sand beds outside TB4, which gives CO2 emissions.</p> <p>ENERGY PRODUCTION - TB4's energy central, TB5, is accounted for because its only purpose is to supply TB4 with energy. Energy sources in a descending order are electricity, natural gas, and district heating. Electricity: Except for the process itself and general use (for example general lighting), refrigerating machines and compressors are powered with electricity. District heating: The system includes a humidifier that uses district heating. Natural gas: TB5 has a natural gas driven hot water boiler.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	The selection of parameters was based on parameters from Volvo Car Corp.'s Environmental Report of 1994.
<b>Time Boundary</b>	<p>The data was collected for 1994, unless other is mentioned, and one should consider some change in process steps etc. as times goes.</p> <p>The figures for energy application and emissions are from 1995, but have been weighted against quantities from 1994.</p>
<b>Geographical Boundary</b>	Sweden
<b>Other Boundaries</b>	<p>Downstream the boundary is set to that one painted coach, solvents to recycling, sludge, paint residues and discharge to air and water are outflows from TB4. Only sludge and paint residues are accounted for as waste (solvents are recycled).</p> <p>Excluded subsystems: The material- and energy application for the point improvement is assumed to be negligible in comparison with the total consumption and is not included. The heat requirement in TB4 is mainly covered with waste heat from Preem Refineries Corporation. Waste heat produced at Preem Refineries Corp. is outside the system</p>

	<p>boundaries of this study. Complementary combustion of natural gas is done in a common Volvo energy central, TD. (The discharge from the combustion of natural gas in TD is separately accounted for in the report 1996:9, Technical Environmental Planning, but has not been included in this activity).</p> <p>No transportations are accounted for in this documentation, only in Report 1996:9, Technical Environmental Planning.</p> <p>Excluded flows: Waste, such as packing material from smaller paint buckets etc., is not included since it's supposed to have a small environmental load compared to other flows. The production capital has no part in the study.</p>
<b>Allocations</b>	Not applicable.
<b>Systems Expansions</b>	Not applicable.

Flow Data	
General Activity QMetaData	
<b>Date Conceived</b>	
<b>Data Type</b>	
<b>Represents</b>	See 'Function'.
<b>Method</b>	For a description on how the data was acquired, see specific QMetaData for each flow.
<b>Literature Reference</b>	Literaturereferences or contact persons aided the data compilation: . Jens Malmodin, Ericsson Radio Systems
<b>Notes</b>	No information is given about the emissions of CO and hydrocarbons, though emissions of these substances occur. The lack of information is due to the fact that the evidence in the investigation of the emissions are too small to allow any general conclusions about these emissions.

Flow Table and Specific Meta Data									
QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Manufactured outside of Volvo.	Input	Refined resource	Base coat, metallic	4.35			kg	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Manufactured outside of Volvo.	Input	Refined resource	Base coat, solid	2.08			kg	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Manufactured outside of Volvo.	Input	Refined resource	Clear coat	2.68			kg	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: Total energy, water and air consumption derives from Mihkel Laks, Volvo Car Corporation. Notes: Energy demand for TB4.	Input	Refined resource	District heating	972			MJ	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: Total energy, water and air consumption derives from Mihkel Laks, Volvo Car Corporation Notes: Energy demand for TB4.	Input	Refined resource	Electricity	2196			MJ	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Manufactured outside of Volvo.	Input	Refined resource	Filler coat	2.77			kg	Technosphere	
Date conceived: 1994 Data type: Unspecified Method: Total energy, water and air consumption derives from Mihkel Laks, Volvo Car Corporation Notes: Energy demand for TB4/TB5.	Input	Refined resource	Natural gas	1800			MJ	Technosphere	
Date conceived: 1995 Data type: Unspecified Method: The consumption of sealant was given by Dejan Nestarovic, Volvo Car Corporation. The sealant figures	Input	Refined resource	Sealants	4.15			kg	Technosphere	

are budgeted figures based on the consumption of 1995. Notes: Sealants = sealants based on PVC. Manufactured outside of Volvo.									
Date conceived: 1994 Data type: Unspecified Method: Information on sludge chemicals derives from Nils Malmbrö, Volvo Car Corporation. Notes: Sludge chemicals = Maintenance chemicals for sprayboot systems.	Input	Refined resource	Sludge chemicals	1.7		kg	Technosphere		
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Solvents = 3,23 kg recycled solvents (Recycling outside of Volvo and then brought back to the system) & 0,92 kg produced solvents (Manufactured outside of Volvo).	Input	Refined resource	Solvents	4.15		kg	Technosphere		
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Manufactured outside of Volvo.	Input	Refined resource	Underbody paste	1.06		kg	Technosphere		
Date conceived: 1994 Data type: Unspecified Method: Data for the emissions was collected from the environmental report and therefore follows the data quality requirements by authorities. Notes: Emission from the energy demand for TB4/TB5.	Output	Emission	CO2	92		kg	Urban air		
Date conceived: 1994 Data type: Unspecified Method: Data for the emissions was collected from the environmental report and therefore follows the data quality requirements by authorities. Notes: Emission from the energy demand for TB4/TB5.	Output	Emission	Dust	0.00005	0.00005	kg	Urban air		
Date conceived: 1994 Data type: Calculated Method: Data for the emissions was collected from the environmental report and therefore follows the data quality requirements by authorities. Notes: Emission from the energy demand for TB4/TB5. Due to a breakdown in 1994 an estimated value based on the emissions for 1995 is used .	Output	Emission	HCFC-22	0.001		kg	Urban air		
Date conceived: 1994 Data type: Unspecified Method: Data for the emissions was collected from the environmental report and therefore follows the data quality requirements by authorities. Notes: Emission from the energy demand for TB4/TB5.	Output	Emission	NOx	0.2008		kg	Urban air		
Date conceived: 1994 Data type: Unspecified Method: Data for the emissions was collected from the environmental report and therefore follows the data quality requirements by authorities. Notes: Emission from the energy demand for TB4/TB5.	Output	Emission	Solvents	1.6		kg	Urban air		
Date conceived: 1994 Data type: Unspecified Method: Based on functional unit.	Output	Product	Painted coach	1		pce	Technosphere		
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: Combustible waste.	Output	Residue	Paint residue	0.54		kg	Technosphere		
Date conceived: 1994 Data type: Unspecified Method: The amount of sludge was collected from Volvo Car Corporation's	Output	Residue	Paint sludge	4.54		kg	Technosphere		

Environmental Report of 1994. Notes: The sludge is combustible waste.									
Date conceived: 1994 Data type: Unspecified Method: EMI, a database at Volvo Car Corp. Notes: The unpure solvent is sent for recycling. 0,54 kg of that is paint residues which is combustible waste. The rest (the pure solvent) is recycled back to the system, see "Solvents".	Output	Residue	Solvents, unpure	2.86			kg	Technosphere	

About Inventory	
<b>Publication</b>	<p>Elisabeth Andersson, Selection out of "Inventering samt miljövardering av TB4, Volvo Personvagnars malerifabrik i Göteborg", Report 1996:9, MSc thesis. Technical Environmental Planning, Chalmers University of Technology Göteborg, Sweden</p> <p>Data documented by: Dan Wahlström, Volvo Technological Development Corporation; Dept. of Environmental Science.</p> <p>Data reviewed by: Elisabeth Andersson and David Weiner, Volvo Technological Development Corporation; Dept. of Environmental Science.</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM.</p>
<b>Intended User</b>	LCA practitioners.
<b>General Purpose</b>	There has been some interest in performing a life cycle assessment of the painting process, especially since purification technique requires a great amount of energy.
<b>Detailed Purpose</b>	Perform an inventory of TB4. The Report (Report 1996:9, MSc thesis. Technical Environmental Planning, Chalmers University of Technology Göteborg, Sweden) which this data is based on, further follows in- and out-flows to/from TB4, but is not accounted for in this documentation.
<b>Commissioner</b>	Nevén, Carl-Otto - Volvo Car Corporation .
<b>Practitioner</b>	Andersson, Elisabeth - Volvo Technological Development Corp. Department of Environmental Science .
<b>Reviewer</b>	Holmberg, Micaela - Volvo Technological Development Corp. Department of Environmental Science
<b>Applicability</b>	<p>This documentation is based on a report (see Publication) which further follows in- and out-flows to/from TB4. All the data from the report has not been considered as relevant and is therefore not included in the documentation.</p> <p>The figures for the process changes as time goes, but it was considered a modern process in 1994 and the technique has not changed a lot. The environmental load for coating a coach is considered to be high, compared to other coating processes and therefore it could, in some cases, be used as a reference scenario. The figures could be used as a comparison with similar coating processes.</p> <p>Only the production of some of the materials have been considered in the original report. Due to the great amount of chemical products that are used in TB4, only one or a couple of products of sealant, underbody pastes, fillers, base coats (both metallic and solid) and clear coats have been followed to the supplier (these flows are not followed and included in this data documentation, see Publication). The inventory data for the products that were used the most was collected and used in the valuation step as approximate values for similar products.</p>
<b>About Data</b>	<p>Data for sealants are approximated from the environmental report of 1995 to values for 1994. This is assumed not to have a great impact on the data quality, due to the large flows.</p> <p>Complementary information for the documentation of data, which were not available in the original report, has been retrieved from the author of the report, see Publication.</p>

## SPINE LCI dataset: Japan, electricity generation mix 1998

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2001-01-31
<b>Copyright</b>	IEA
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Japan, electricity generation mix 1998
<b>Functional Unit</b>	Total electricity produced during 1998

<b>Functional Unit Explanation</b>	The electricity mix refer to the total amount of electricity generated by different power sources expressed in GWh during the year 1998.
<b>Process Type</b>	Unit operation
<b>Site</b>	Japan
<b>Sector</b>	Energyware
<b>Owner</b>	Japan
<b>Technical system description</b>	The generation of electricity with different power generating systems in Japan during the year 1998. Japan includes Okinawa.

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Not applicable, since the data only refer to the electricity generation mix. The environmental load for generation of electricity is not included.
<b>Time Boundary</b>	The data refer to 1998.
<b>Geographical Boundary</b>	Only electricity produced in Australia is considered. Import or export of electricity is not included.
<b>Other Boundaries</b>	-
<b>Allocations</b>	Not applicable
<b>Systems Expansions</b>	Not applicable

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1998
<b>Data Type</b>	Derived, statistics
<b>Represents</b>	See 'Function'.
<b>Method</b>	The data are collected from IEA Statistics.
<b>Literature Reference</b>	IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8, page II.300.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

<b>Intended User</b>	LCA practitioners
<b>General Purpose</b>	The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.
<b>Detailed Purpose</b>	The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyvningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.

## SPINE LCI dataset: Jet plane, A 300-B4, 1200 km

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1999 - 12
<i>Copyright</i>	NTM
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Jet plane, A 300-B4, 1200 km
<i>Functional Unit</i>	1 tonkm, 75 %
<i>Functional Unit Explanation</i>	Energy use and emissions refer to the transportation of 1 ton goods 1 km calculated for 1200 km flight distance and an average utilisation level equivalent to 75 % of the aircrafts maximum payload capacity.
<i>Process Type</i>	Gate to gate
<i>Site</i>	Sweden
<i>Sector</i>	Air transport
<i>Owner</i>	Sweden
<i>Technical system description</i>	<p>Operation of jet plane, type Airbus A 300-B4 with 2 engines Rolls Royce RB211-524, 1200 km, European flight, with 8 minutes of taxiing and landing run (3 min. in and 5 min. out). This is a larger plane, with a capacity of approximately 270 passengers in a passenger version. The plane presented here, however, is strictly a freight version which seats no passengers.</p> <p>Utilisation level is set to 75% for the medium quantity, 100% for "min" and 50% for "max". Fuel: Jet-A1. Takeoff Weight (TOW): 170 tons. Speed (cruise): 897 km/h. Maximum payload 45 000 kg.</p>

System Boundaries	
<i>Nature Boundary</i>	<p>Regulated missions to air from combustion of the fuel are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>- Regulated emissions for diesel engines: NOx, HC, Particles and CO</li> <li>- Fuel regulated: SO2</li> <li>- Tax regulated CO2</li> </ul> <p>Other environmental impacts, e.g., diffuse emissions to air, emissions to water and ground, noise, encroachment, from the operation of the aircraft are not included.</p>
<i>Time Boundary</i>	The data represents aircrafts in use in 2000.
<i>Geographical Boundary</i>	Data is based on Swedish and European conditions.
<i>Other Boundaries</i>	<p>The distance chosen is 1200 km, which is a typical distance for domestic goods transport flights in Sweden.</p> <p>The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.</p> <p>Parameters not considered:</p> <p>External conditions i.e. climate etc.</p> <p>Maintenance level of the aircraft.</p> <p>Excluded subsystems:</p> <p>Precombustion i.e. production and distribution of fuels</p> <p>Maintenance and aftertreatment of the aircraft</p> <p>Handling of production rests</p>
<i>Allocations</i>	N/A
<i>Systems Expansions</i>	N/A

Flow Data
General Activity QMetadata

<b>Date Conceived</b>	
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	For the calculation of emissions from the jet plane (Airbus A 300-B4), the flight simulation method of the Aerotechnical Research Station (FFA) has been used. FFA has used a software tool "PIANO", developed for studies of aircraft design. The tool contains a database with aerodynamical data for different aircrafts and engines. The emission data is from ICAO emission database (ICAO,1995). The calculations in PIANO is calibrated after results from the EU-project AEROCERT (Näs P, 1998) in which samples from real life flights has been analysed. The taxiing and landing run time chosen is 8 minutes (3 min. in, 5 min. out). Taxiing and loading run time depends mainly on the airport. The medium quantity implies a utilisation level of 75% of the aircrafts maximum payload capacity , "min" implies a utilisation level of 100% and "max" 50%.

### About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>

<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	Pålsson, Anette - FFA, Bromma .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The emissions vary considerably between different types of aircraft and engine combinations. Thus, the emission data given in this context are only applicable to the specific type of aircraft and distances of this example. Provided that the plane types presented in this context are representative for their categories (size and age), the figures may be used for estimations of total emissions from a certain traffic volume.</p> <p>The total amount of emissions depends on a number of parameters of which the most important are starting weight and transportation distance. The longer the distance, the higher the emissions per flight, but lower per tonkm, since take-off and landing always have to take place in a flight.</p> <p>The distance chosen is 1200 km, which is a typical distance for flights for goods transport in Europe.</p> <p>The aircraft presented is a version that carries only goods. It is commonly used for goods transport in Sweden and in Europe. It is a large jet with 2 engines and in a passenger version it would carry almost 270 passengers.</p> <p>The taxiing and landing run time chosen is 8 minutes (3 min. in, 5 min. out). Taxiing and loading run time depends mainly on the airport.</p> <p>The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.</p> <p>For calculations of emissions from flights of other distances than the ones given, the following relations can be used. They apply to flights of distances between 600 - 1200 km, with Airbus A 300-B4.</p> <p>Total emissions = Constant emission (kg) + Variable emission (kg/km) * distance (km)</p> <p>50% payload:  Constant emission  CO2=2171  NOX=11,1  HC=0,34  CO=6,1</p> <p>Variable emission  CO2=9,10  NOX=0,030  HC=0,0003  CO=0,012</p> <p>75% Payload:  Constant emission  CO2=2554  NOX= 13,3  HC=0,36  CO=6,3</p> <p>Variable emission  CO2=9,35  NOX=0,031  HC=0,0003  CO=0,124</p> <p>100% Payload:  Constant emission  CO2=3302  NOX= 17,6  HC=0,375  CO=6,532</p> <p>Variable emission  CO2=9,48  NOX=0,032  HC=0,0003  CO=0,012</p>
<b>About Data</b>	<p>Data are calculated from the simulation method of the Aeronautical Research Institute of Sweden (FFA).</p> <p>For the calculation of emissions from the jet plane (Airbus A 300-B4), the flight simulation method of the Aeronautical Research Institute of Sweden (FFA) has been used. ## SPINE LCI dataset: Jet plane, B727-200, 1200 km

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1999 - 12
<b>Copyright</b>	NTM
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Jet plane, B727-200, 1200 km
<b>Functional Unit</b>	1 tonkm, 75 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 km calculated for 1200 km flight distance and an average utilisation level equivalent to 75 % of the aircrafts maximum payload capacity.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Air transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of jet plane, type Boeing B727-200 with 3 engines Pratt&amp;Whitney JT8D-9, 1200 km, european flight, with 8 minutes of taxiing and landing run (3 min. in and 5 min. out). The plane is somewhat older, but still regular in freight transports. In a passenger version, the plane can seat approximately 200 passengers. The plane presented here, however, is strictly a freight version which seats no passengers.</p> <p>Utilisation level is set to 75% for the medium quantity, 100% for "min" and 50% for "max". Fuel: Jet-A1. Takeoff Weight (TOW): 83,8 tons. Speed (cruise): 965 km/h. Maximum payload 45 000 kg.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated missions to air from combustion of the fuel are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>- Regulated emissions for diesel engines: NOx, HC, Particles and CO</li> <li>- Fuel regulated: SO2</li> <li>- Tax regulated CO2</li> </ul> <p>Other environmental impacts, e.g., diffuse emissions to air, emissions to water and ground, noise, encroachment, from the operation of the aircraft are not included.</p>
<b>Time Boundary</b>	The data represents aircrafts in use in 2000.
<b>Geographical Boundary</b>	Data is based on Swedish and European conditions.
<b>Other Boundaries</b>	<p>The distance chosen is 1200 km, which is a typical distance for goods transport flights in Europe.</p> <p>The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.</p> <p>Parameters not considered: External conditions i.e. climate etc. Maintenance level of the aircraft.</p> <p>Excluded subsystems: Precombustion i.e. production and distribution of fuels Maintenance and aftertreatment of the aircraft Handling of production rests</p>

### About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	Pålsson, Anette - FFA, Bromma .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The emissions vary considerably between different types of aircraft and engine combinations. Thus, the emission data given in this context are only applicable to the specific type of aircraft and distances of this example. Provided that the plane types presented in this context are representative for their categories (size and age), the figures may be used for estimations of total emissions from a certain traffic volume.</p> <p>The total amount of emissions depends on a number of parameters of which the most important are starting weight and transportation distance. The longer the distance, the higher the emissions per flight, but lower per tonkm, since take-off and landing always have to take place in a flight.</p>

	<p>The distance chosen is 1200 km, which is a typical distance for domestic flights for goods transport in Europe.</p> <p>The aircraft presented is a version that carries only goods. It is a rather old version, but still rather commonly used for goods transport in Sweden and in Europe. It is a jet with 3 engines and in a passenger version it would carry 200 passengers.</p> <p>The taxiing and landing run time chosen is 8 minutes (3 min. in, 5 min. out). Taxiing and loading run time depends mainly on the airport.</p> <p>The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.</p> <p>For calculations of emissions from flights of other distances than the ones given, the following relations can be used. They apply to flights of distances between 600 - 1200 km, with Boeing 727-200.</p> <p>Total emissions = Constant emission (kg) + Variable emission (kg/km) * distance (km)</p> <p>50% payload:  Constant emission  CO<sub>2</sub>=4027  NOX=22,2  HC=3,39  CO=9,7</p> <p>Variable emission  CO<sub>2</sub>=14,93  NOX=0,043  HC=0,0081  CO=0,040</p> <p>75% Payload:  Constant emission  CO<sub>2</sub>=4727  NOX=26,5  HC=3,41  CO=9,2</p> <p>Variable emission  CO<sub>2</sub>=15,44  NOX=0,046  HC=0,008  CO=0,0389</p> <p>100% Payload:  Constant emission  CO<sub>2</sub>=5829  NOX=32,275  HC=3,638  CO=9,654</p> <p>Variable emission  CO<sub>2</sub>=15,36  NOX=0,047  HC=0,0075  CO=0,036</p>
<b>About Data</b>	<p>Data are calculated from the simulation method of the Aeronautical Research Institute of Sweden (FFA).</p> <p>For the calculation of emissions from the jet plane (Boeing 727-200), the flight simulation method of the Aeronautical Research Institute (FFA) has been used. ## About Inventory

### Publication

www.ntm.a.se

Data documented by: Magnus Blinge, Dept. for Transportation & Logistics, Chalmers University of Technology

Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.

The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:

BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation

### Detailed Purpose

The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)

The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NTM.

### Practitioner

Pålsson, Anette - FFA, Bromma .

### Reviewer

None, to be reviewed. -

### Applicability

The emissions vary considerably between different types of aircraft and engine combinations. Thus, the emission data given in this context are only applicable to the specific type of aircraft and distances of this example. Provided that the plane types presented in this context are representative for their categories (size and age), the figures may be used for estimations of total emissions from a certain traffic volume.

The total amount of emissions depends on a number of parameters of which the most important are starting weight and transportation distance. The longer the distance, the higher the emissions per flight, but lower per tonkm, since take-off and landing always have to take place in a flight.

The distance chosen is 1200 km, which is a typical distance for domestic flights for goods transport in Sweden.

The aircraft presented is a version that carries only goods. It is commonly used for goods transport in Sweden and in Europe. It is a middle-sized jet with 2 engines and in a passenger version it would carry almost 150 passengers.

The taxiing and landing run time chosen is 8 minutes (3 min. in, 5 min. out). Taxiing and loading run time depends mainly on the airport.

The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.

For calculations of emissions from flights of other distances than the ones given, the following relations can be used. They apply to flights of distances between 600 - 1200 km, with Boeing 737-300QC.

Total emissions = Constant emission (kg) + Variable emission (kg/km) \* distance (km)

	<p>50% payload: Constant emission CO<sub>2</sub>=2171 NOX=11,1 HC=0,34 CO=6,1</p> <p>Variable emission CO<sub>2</sub>=9,10 NOX=0,030 HC=0,0003 CO=0,012</p> <p>75% Payload: Constant emission CO<sub>2</sub>=2554 NOX=13,3 HC=0,0003 CO=0,0124</p> <p>Variable emission CO<sub>2</sub>=9,35 NOX=13,3 HC=0,36 CO=6,3</p> <p>100% Payload: Constant emission CO<sub>2</sub>=3302 NOX=17,6 HC=0,375 CO=6,532</p> <p>Variable emission CO<sub>2</sub>=9,48 NOX=0,032 HC=0,0003 CO=0,012</p>

## SPINE LCI dataset: Jet plane, B747-400, 600 km

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1999 - 12
<b>Copyright</b>	NTM
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Jet plane, B747-400, 600 km
<b>Functional Unit</b>	1 tonkm, 75 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 km calculated for 600 km flight distance and an average utilisation level equivalent to 75 % of the aircrafts maximum payload capacity.

<b>Process Type</b>	Gate to gate
<b>Site</b>	Sweden
<b>Sector</b>	Air transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of jet plane, type Boeing B747-400 with 4 engines General Electric CF6-80C2A3, 600 km, Swedish domestic flight, with 8 minutes of taxiing and landing run (3 min. in and 5 min. out). The plane is a jumbojet, which in a passenger version seats more than 400 passengers. The plane presented here, however, is strictly a freight version which seats no passengers.</p> <p>Utilisation level is set to 75% for the medium quantity, 100% for "min" and 50% for "max". Fuel: Jet-A1. Takeoff Weight (TOW): 394,6 tons. Speed (cruise): 910 km/h. Maximum payload 93 000 kg.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated missions to air from combustion of the fuel are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>- Regulated emissions for diesel engines: NOx, HC, Particles and CO</li> <li>- Fuel regulated: SO2</li> <li>- Tax regulated CO2</li> </ul> <p>Other environmental impacts, e.g., diffuse emissions to air, emissions to water and ground, noise, encroachment, from the operation of the aircraft are not included.</p>
<b>Time Boundary</b>	The data represents aircrafts in use in 2000.
<b>Geographical Boundary</b>	Data is based on Swedish and European conditions.
<b>Other Boundaries</b>	<p>The distance chosen is 600 km, which is a typical distance for domestic goods transport flights in Sweden.</p> <p>The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of 100% and "max" 50%.</p> <p>Parameters not considered:</p> <p>External conditions i.e. climate etc.</p> <p>Maintenance level of the aircraft.</p> <p>Excluded subsystems:</p> <p>Precombustion i.e. production and distribution of fuels</p> <p>Maintenance and aftertreatment of the aircraft</p> <p>Handling of production rests</p>

## About Inventory

### Publication

www.ntm.a.se

Data documented by: Magnus Blinge, Dept. for Transportation & Logistics, Chalmers University of Technology

Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.

The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:

BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation

### Detailed Purpose

The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)

The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.

### Commissioner

- NTM.

### Practitioner

Pålsson, Anette - FFA, Bromma .

### Reviewer

None, to be reviewed. -

### Applicability

The emissions vary considerably between different types of aircraft and engine combinations. Thus, the emission data given in this context are only applicable to the specific type of aircraft and distances of this example. Provided that the plane types presented in this context are representative for their categories (size and age), the figures may be used for estimations of total emissions from a certain traffic volume.

The total amount of emissions depends on a number of parameters of which the most important are starting weight and transportation distance. The longer the distance, the higher the emissions per flight, but lower per tonkm, since take-off and landing always have to take place in a flight.

The distance chosen is 600 km, which is a typical distance for domestic flights for goods transport in Sweden.

The aircraft presented is a version that carries only goods. It is commonly used for goods transport in Sweden and in Europe. It is a large (Jumbo) jet with 4 engines and in a passenger version it would carry more than 400 passengers.

The taxiing and landing run time chosen is 8 minutes (3 min. in, 5 min. out). Taxiing and loading run time depends mainly on the airport.

The medium quantity implies a utilisation level of 75% , "min" implies a utilisation level of

	<p>100% and "max" 50%.</p> <p>For calculations of emissions from flights of other distances than the ones given, the following relations can be used. ## About Inventory

### Publication

IEA Statistics, Energy statistics of OECD countries 1997-1998, 2000 Edition, ISBN 92-64-05914-8.

-----  
Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden

Documentation reviewed by:  
Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden  
-----

### Intended User

LCA practitioners

### General Purpose

The data is intended to be used as basis when calculating the environmental load from electricity production in OECD countries/regions.

### Detailed Purpose

The specific aim for documenting the IEA statistics about electricity generation mixes in the OECD countries/regions is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstyvningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines.

### Commissioner

Birgit Bodlund - Vattenfall Elproduktion AB, Stockholm, Sweden .

### Practitioner

Setterwall, Caroline - SwedPower AB, Stockholm, Sweden .

### Reviewer

CPM -

### Applicability

The environmental load may be calculated using the electricity generation mix together with LCI-data describing electricity production of different power generating systems. The power sources is found in "Represents" in QMetaData for each specific flow.

When the electricity generation mix is used as general LCA data for the Swedish EPD system, the following data sets should be used in the calculations:

- Biofuel electricity energy system, EPD-version
- Fuel gas electricity energy system, EPD-version
- Hydro electricity energy system, EPD-version
- Lignite electricity energy system, EPD-version
- Nuclear electricity energy system, EPD-version
- Oil electricity energy system, EPD-version
- Stone coal electricity energy system, EPD-version
- Wind electricity energy system, EPD-version

The following countries and regions have been documented in the database:

Australia, electricity generation mix 1998  
Austria, electricity generation mix 1998  
Belgium, electricity generation mix 1998  
Canada, electricity generation mix 1998  
Czech Republic, electricity generation mix 1998  
Denmark, electricity generation mix 1998  
European Union, electricity generation mix 1998  
Finland, electricity generation mix 1998  
France, electricity generation mix 1998  
Germany, electricity generation mix 1998  
Greece, electricity generation mix 1998  
Hungary, electricity generation mix 1998  
Iceland, electricity generation mix 1998  
Ireland, electricity generation mix 1998  
Italy, electricity generation mix 1998  
Japan, electricity generation mix 1998  
Korea, electricity generation mix 1998  
Luxembourg, electricity generation mix 1998  
Mexico, electricity generation mix 1998  
Netherlands, electricity generation mix 1998  
New Zealand, electricity generation mix 1998  
Norway, electricity generation mix 1998  
OECD Europe, electricity generation mix 1998  
OECD North America, electricity generation mix 1998  
OECD Pacific, electricity generation mix 1998

	OECD total, electricity generation mix 1998 Poland, electricity generation mix 1998 Portugal, electricity generation mix 1998 Spain, electricity generation mix 1998 Sweden, electricity generation mix 1998 Switzerland, electricity generation mix 1998 Turkey, electricity generation mix 1998 United Kingdom, electricity generation mix 1998 United States, electricity generation mix 1998

## SPINE LCI dataset: Landfilling of solid municipal waste

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2002-08-14
<b>Copyright</b>	McDougall F. et al, Integrated Solid Waste Management
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Landfilling of solid municipal waste
<b>Functional Unit</b>	1 tonne of waste landfilled
<b>Functional Unit Explanation</b>	1 tonne of waste landfilled is waste from waste collection and sorting stations, biological treatment and thermal treatment plants.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Europe
<b>Sector</b>	
<b>Owner</b>	Europe
<b>Technical system description</b>	<p>Landfill is a waste treatment process with its own inputs and outputs, rather than simply a sink for the final disposal of solid waste. The environmental burdens of landfilling waste will depend both on the landfill design and method of operation, and the nature of the waste deposited.</p> <p>Included in the landfill system boundary are landfill, landfill gas collection, landfill gas combustion, hazardous landfill and leachate treatment.</p> <p>There are four main waste streams from municipal solid waste management systems that are landfilled. Inputs are:  Restwaste (can be total Municipal solid waste), Sorting residue, Biological treatment residue and Thermal treatment residues (ash, filter dust and other residues from gas cleaning).  Input streams can be divided into two groups; non-hazardous and hazardous. The inputs to the landfill system occur over a limited time period, i.e. the working life of the site.</p> <p>The outputs from the system occur over a much longer time span, which may involve at least tens and maybe hundreds of years. Outputs are:  -- Landfill gas from biodegradable fraction in Municipal solid waste and biologically treated material (it is assumed for the purpose of this model that no landfilled gas is produced from ash)  -- Leachate which result in solid waste residue from leachate treatment  -- Inert solid waste from landfilled waste</p> <p>Outputs will depend on many factors e.g. the nature of the waste, method and level of compaction and the engineering of the landfill (how well the landfill is sealed).</p> <p>Landfill gas:  Landfill gas is produced by an anaerobic decomposition of biodegradable organic material. The composition of the gas released will vary through the different phases of the active life of a landfill site. The composition of landfill gas is similar to that of biogas, and the heat content is similar. A typical composition of landfill gas also used in this documentation is given below (% by volume)( WMI, 1994):</p> <p>Methane, 52.8%  Carbon dioxide, 44.1%  Oxygen, 0.5%  Nitrogen, 2%</p> <p>If no collection system exists for gas control or energy recovery, all of the landfill gas eventually leak out of the site and enter the atmosphere. Where gas collection occurs like in this model, around 40% will typically be recovered, whilst the remaining 60% still enters the atmosphere. (McDougall, 2001)</p> <p>Leachate:  Any leachate treatment residues will be added to the total amount of final solid waste (Residual waste). The amount of leachate produced depends on many factors, for example the amount of rainfall on a landfill site. Leachate consists of organic C, N, F, P, S, Cl and heavy metals such as Cd, Cu, Hg, Pb and Zn. Composition of leachate varies with the stage</p>

	<p>of decomposition of the waste (e.g. pH, concentration of BOD, COD etc)</p> <p>Energy: The landfill process will consume energy both in the form of vehicle fuel and electricity. For all waste types landfilled, fuel and electricity will be consumed in the operation of the site itself. Data suggest that the fuel consumption for the landfilling process is around 0.6 litres of diesel per cubic metre of void space filled. (Biffa Waste Service, 1994) Energy recovery involves burning of landfill gas in a gas engine to generate electricity. Electrical recovery of 1.5 kWh/Nm<sup>3</sup> of landfill gas collected gives 525 kWh per tonne waste landfilled, with an assumed conversion efficiency of 30% (ETSU, 1995).</p> <p>References: Waste Management International, Landfill Gas Data, Waste Management International, London, 1994 Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter &amp; Gamble Technical Centres Limited, Blackwell Science, 2001 ETSU, Energy From Landfill Gas, Appley Bridge Extended Renewable Energy Case Study, ETSU, New and Renewable Energies Bureau, Harwell, Oxfordshire, UK, 1995 Biffa Waste Service, communication, 1994</p>
--	---

System Boundaries	
<b>Nature Boundary</b>	<p>A landfill site consumes land and the final solid waste fills up a volume, how much is not presented in this document due to lack of data.</p> <p>Emissions to air from landfill gas, are only represented of Methane, Carbon dioxide, Oxygen and Nitrogen (they are the main components in landfill gas) Methane has been reported to be responsible for about 20% (Lashof and Ahuja, 1990) of recent increase in global warming and landfills are thought to be the major source of methane.</p> <p>Emissions from generation of electricity from landfill gas within the system are not included due to lack of data.</p> <p>Emissions to water from different materials in the waste and emissions from leachate are not included in the system due to lack of data.</p> <p>Reference: Lashof and Ahuja, Relative contribution to greenhouse gas emissions to global warming, Nature, 344, April, 1990</p>
<b>Time Boundary</b>	<p>The inputs to the landfill system occur over a limited time period, i.e. the working life of the site, about 30 years. (McDougall, IWM, 2001)</p> <p>Data was collected during 1992-2001</p>
<b>Geographical Boundary</b>	This activity represents a landfill site in a European country.
<b>Other Boundaries</b>	<p>There are no data presented on electricity used in the landfill activity.</p> <p>Combustion of landfill gas is included in the system but data on emissions during power generation could not be found.</p> <p>All leachate produced is collected as residual waste. Leachate collection and treatment will consume energy, but that is not included due to lack of suitable data.</p>
<b>Allocations</b>	Not applicable
<b>Systems Expansions</b>	Not applicable

Method: See description of functional unit.	Input	Refined resource	Waste to landfill	1		tonne	Technosphere	
Data type: Unspecified Method: Fuel consumption of 0.6 litre per cubic meter of void space filled in a landfill is an average number given by Biffa Waste Service 1994 through communication. Literature: Biffa Waste Service, 1994	Input	Refined resources	Diesel fuel	0.6		l	Technosphere	
Method: The composition of landfill gas usually is 44.1% CO <sub>2</sub> , 52.8% CH <sub>4</sub> , 0.5 % O <sub>2</sub> and 2% N <sub>2</sub> (% by volume)(WMI, 1994) 60% of landfill gas enters the atmosphere since 40% of gas is used for energy recovering. 60% of landfill gas (350Nm <sup>3</sup> /tonne waste) is 210 Nm <sup>3</sup> /tonne. Density of CO <sub>2</sub> (0* Celcius, 100 kPa)=1.95 kg/m <sup>3</sup> Literature: Waste Management International, Landfill Gas Data, Waste Management International, London, 1994	Output	Emission	CO <sub>2</sub>	180.59		kg	Air	
Method: The composition of landfill gas usually is 44.1% CO <sub>2</sub> , 52.8% CH <sub>4</sub> , 0.5 % O <sub>2</sub> and 2% N <sub>2</sub> (% by volume)(WMI, 1994) 60% of landfill gas enters the atmosphere since 40% of gas is used for energy recovering. 60% of landfill gas (350Nm <sup>3</sup> /tonne waste) is 210 Nm <sup>3</sup> /tonne. Density of CH <sub>4</sub> (0* Celcius, 100 kPa)=0.71 kg/m <sup>3</sup> Literature: Waste Management International, Landfill Gas Data, Waste Management International, London, 1994	Output	Emission	Methane	78.72		kg	Air	
Method: The composition of landfill gas usually is 44.1% CO <sub>2</sub> , 52.8% CH <sub>4</sub> , 0.5 % O <sub>2</sub> and 2% N <sub>2</sub> (% by volume)(WMI, 1994) 60% of landfill gas enters the atmosphere since 40% of gas is used for energy recovering. 60% of landfill gas (350Nm <sup>3</sup> /tonne waste) is 210 Nm <sup>3</sup> /tonne. Density of N <sub>2</sub> (0* Celcius, 100 kPa)=1.95 kg/m <sup>3</sup> Literature: Waste Management International, Landfill Gas Data, Waste Management International, London, 1994	Output	Emission	N <sub>2</sub>	5.17		kg	Air	
Method: The composition of landfill gas usually is 44.1% CO <sub>2</sub> , 52.8% CH <sub>4</sub> , 0.5 % O <sub>2</sub> and 2% N <sub>2</sub> (% by volume)(WMI, 1994) 60% of landfill gas enters the atmosphere since 40% of gas is used for energy recovering. 60% of landfill gas (350Nm <sup>3</sup> /tonne waste) is 210 Nm <sup>3</sup> /tonne. Density of O <sub>2</sub> (0* Celcius, 100 kPa)=1.41 kg/m <sup>3</sup> Literature: Waste Management International, Landfill Gas Data, Waste Management International, London, 1994	Output	Emission	O <sub>2</sub>	1.48		kg	Air	
Method: Landfill gas (52.8% CH <sub>4</sub> , 44.1% CO <sub>2</sub> , 0.5 O <sub>2</sub> , 2% N <sub>2</sub> ) has an energy content of about 18 MJ/Nm <sup>3</sup> , with a calorific value of 37.75 MJ/Nm <sup>3</sup> for methane. (McDougall, 2001) Landfill gas produced is 350 Nm <sup>3</sup> /tonne input waste (250 Nm <sup>3</sup> /tonne from biodegradable fractions in Municipal solid waste + 100 Nm <sup>3</sup> /tonne from biol.treatment products). It is assumed by McDougall, 2001 that 140 Nm <sup>3</sup> is collected. Assume 60% energy recovery from gas and 30% efficiency of electricity generation gives 1.5 kWh/Nm <sup>3</sup> of landfilled gas collected. 1.5*140= 210 kWh (McDougall, 2001)(Perry and Green,1997) Literature: Perry and Green, The Chemical Engineer's Handbook, McGraw Hill, 1997. Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001	Output	Product	Electricity	210		kWh	Technosphere	

<p>Method: An estimation that around 13 % of the rainfall on a landfill site emerges as leachate, has been made. For sites in Germany with an average annual rainfall of 750 mm, this would produce around 100 litres of leachate per square metre of landfill site, per year. With a 20-metre dept of waste and density of 1 tonne/m<sup>3</sup> gives a leachate production of 5 litres per tonne landfilled waste per year. If the active period for leachate production is around 30 years, the total amount would be 150 litres per tonne waste. (McDougall, IWM, 2001)</p> <p>0.015 tonne solid waste from leachate treatment/m<sup>3</sup> of leachate treated and 150 litre (0.15m<sup>3</sup>)/tonne waste input, result in a residual waste of 2.25 kg which were added to the inert solid waste landfilled. (McDougall, IWM, 2001)</p> <p>Literature: Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter &amp; Gamble Technical Centres Limited, Blackwell Science, 2001</p> <p>Notes: Density of Residual waste was estimated to be 1.032 ton/m<sup>3</sup> (McDougall, 2001) giving a volume of 971.2 m<sup>3</sup> of residual waste.</p>	Output	Product	Residual waste	1002.25			tonne	Ground

About Inventory	
<b>Publication</b>	<p>McDougall F. et al, Integrated Solid Waste Management - A Life Cycle Inventory, Procter &amp; Gamble Technical Centres Limited, Blackwell Science, 2001</p> <p>Data documented by: Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology.</p> <p>Documentation reviewed by: Ann-Christin Pålsson, Industrial Environmental Informatics, Chalmers University of Technology</p> <p>Published in SPINE@CPM: 14 August 2002</p>
<b>Intended User</b>	The original study this d
<b>General Purpose</b>	Data about waste management systems are insufficient and more data are required by the industry.
<b>Detailed Purpose</b>	<p>This documentation is based on a study about Integrated Solid Waste Management performed by Forbes McDougall et al at Procter &amp; Gamble Technical Centres, 2001. The aims of that study was to introduce a LCI model for Integrated Waste Mangement and to provide data that support the concept of Integrated Waste Management as a sustainable method of managing solid waste.</p> <p>The purpose of the documentation of this system has been to make data for waste management available in this format for the industry.</p>
<b>Commissioner</b>	
<b>Practitioner</b>	
<b>Reviewer</b>	
<b>Applicability</b>	<p>The environmental burdens of landfilling waste will depend on the landfill design and method of operation, and the nature of the waste deposited. There are not much data available for individual material fractions in the inputs and outputs and the ones available generally refer to the landfilling of mixed waste streams, such as Municipal solid waste.</p> <p>It is difficult to provide typical figures for the generation of leachate and landfill gas from landfilled wastes. For leachate both the amount and composition of leachate will depend on many factors, including the nature of the waste, method and level of compaction, the engineering design of the landfill (e.g. how well the landfill is sealed) and the annual rainfall of the region. German scientists have estimated that around 13 % of the rainfall on a landfill site emerges as leachate. For sites in Germany with an average annual rainfall of 750mm, this would produce around 100 litres of leachate per square metre of landfill site, per year. With a 20-metre dept of waste, density 1 tonne/m<sup>3</sup> gives a leachate production of 5 litres per tonne landfilled waste per year. If the active period for leachate production is around 30 years, the total amount would be 150 litres per tonne waste. Composition of leachate varies with the stage of decomposition of the waste (e.g. pH, concentration of BOD, COD etc)</p> <p>Outputs will depend on many factors e.g. the nature of the waste, method and level of compaction and the engineering of the landfill (how well the landfill is sealed).</p> <p>The landfill process will consume energy both in the form of vehicle fuel and electricity. For household waste that is landfilled directly, where the distance from the collection area to</p>

	<p>the landfill site is large, a transfer station may be used to bulk up the waste for more efficient transport by larger truck or rail. There are no data available on the energy consumption of transfer stations, therefore they are not included in this activity, but generic fuel consumption data for road transport can be used. For all waste types landfilled, fuel and electricity will also be consumed in the operation of the site itself. Data suggest that the fuel consumption for the landfilling process is around 0.6 litres of diesel per cubic metre of void space filled. (Mc Dougall, Integrated Waste Management, 2001)</p> <p>Landfill gas not only consists of Methane, Carbon dioxide, Oxygen and Nitrogen but also of smaller amounts of Ethane, Hydrogen sulfide, propane, Toluene, xyelne etc. Methane has been reported to be responsible for about 20% of recent increase in global warming and landfills are thought to be the major source of methane. (Lashof and Ahuja, Relative contribution to greenhouse gas emissions to global warming, Nature, 344, April, 1990)</p>
<b>About Data</b>	<p>Data is based on a study performed by Procter &amp; Gambler about Integrated Waste Management (McDougall F. et al, Procter &amp; Gamble Technical Centres Limited, Blackwell Science, 2001).</p> <p>Data are generally averages, giving an approximate measure of the environment burdens associated with the system. The descriptions of the activity is how it was understood by the person who made the documentation.</p>

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1998
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying</p>

	weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO <sub>2</sub> and SO <sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i> , The <i>emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under actual operation for Swedish conditions. For medium and light lorries, the emission values have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NO<sub>x</sub> 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ### About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the</p>

	technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	Björkman, Mikael - BTL 412 97 Göteborg .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.</p> <p>The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.</p> <p>The age categories of the vehicles compiled in the work are:  Older than 1990,  Euro 0: Introduced 1987, law from 1990  Euro 1: Introduced 1991, law from 1993  Euro 2: Introduced 1993, law from 1996  However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.</p> <p><b>Handling of goods</b></p> <p>The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)</p> <p>Terminal based road transports generally consists of 1-3 parts:</p> <ol style="list-style-type: none"> <li>1. Collection of the goods to terminal</li> <li>2. Long-distance transport between terminals</li> <li>3. Distribution of the goods from terminal</li> </ol> <p>The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.</p> <p>--<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited</p> <p>--<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b></p> <p>--<i>Parcel truck/van, max 3,5 tonnes</i> is mainly used for transportation of parcels.</p> <p>--<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.</p> <p>--<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.</p> <p>--<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.</p> <p>--<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.</p> <p>--<i>Truck with semi-trailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b></p> <p>The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p>

	<p>-excavated materials and round timber - 50%</p> <p>-manufactured products (wholesale goods) - slightly more than 20%</p> <p>-provisions and animal forage - approx. 15%</p> <p>-mixed cargo (general goods) approx - 10 %.</p> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SO<sub>x</sub> emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The emission data of medium-sized and light trucks have been collected from certification values of new engines, driven according to fix driving cycles, e.g. ECR-49 (IVL and Mercedes).
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SO<sub>x</sub> emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The emission data of medium-sized and light trucks have been collected from certification values of new engines, driven according to fix driving cycles, e.g. ECR-49 (IVL and Mercedes).
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

<b>Flow Data</b>	
<b>General Activity QMetadata</b>	
<b>Date Conceived</b>	1998 - 08
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>Data have been put together for NTM by a group of manufacturers and hauliers, i.e. Volvo, Scania, BTL, ASG, Swedish Hauliers Association. Data are presented in relation to the transport work, in g/tonkm. The utilisation level is assumed to be 50% for delivery vans and medium-sized lorries in local distribution traffic and 70 % for long distance transport with heavy trucks. The utilisation level is based on the load carrying weight, i.e. the weight on which the customer price is based. This means that bulky cargo is multiplied with a factor in order to compensate for taking up volume. The average break-point density is 275 kg/m<sup>3</sup>. Energy use and emissions per tonkm with a truck should be based on the load carrying weight. The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the fuel consumption due to degeneration, driving behaviour etc.. The emissions of CO<sub>2</sub> and SO<sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i>, The emission data have been produced through simulations conducted by Volvo Trucks and Scania in 1997. The simulations were based on certification values for engines and fuel consumption under actual operation for Swedish conditions. For medium and light lorries, the emission values</p>

	have been obtained from certification values for new engines that are operated in accordance with established operating cycles, e.g. ECR-49 (IVL and Mercedes). Emissions data related to fuel consumption Emission factors (g/liter) Euro 0 Euro 1 Euro 2 Law from: 1980 1990 1993 1996 NOx 52+/- 5 44 27 23 HC 6+/- 2 2.1 1.8 1.3 PM 3+/- 2 1 0.5 0.35 CO 8+/- 3 3.7 3.4 2.5 This shows emissions factors in g/l for heavy lorries. With fuel consumption as a basis, it is possible to calculate the emissions. The data on emissions are based on measurements in accordance with applicable standards for certification. liters/100 km Empty Full load Distribution lorry (Payload 8.5 ton) 20-25 25-30 Med.-size lorry (Payload 14 ton) 25-30 30-40 Heavy lorry w trailer (Payl. 26 ton) 22-27 32-38 Heavy lorry w 2 trail. ### About Inventory

<b>Publication</b>	<p>www.ntm.a.se</p> <p>Data documented by: Magnus Blinge, Dept. for Transportation &amp; Logistics, Chalmers University of Technology</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compile a set of data for the different traffic modes that are accepted by representatives for all traffic modes (air, rail, road and sea). In order to be able to make correct assessments, it is crucial to have knowledge of the different functions used for calculations, assumptions and environmental load of different modes of transportation. The ambition within NTM (Network for goods transportation and the environment) is to compile and document relevant environmental interventions associated with different transport systems, and to localise gaps of knowledge. The network is also intended to serve as a forum for discussion between different actors in the transport business.</p> <p>The members of NTM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology and the Swedish Society for Natural Conservation</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NTM was to gather available data for energy use and emissions for the operation of different goods transport systems. The work is conducted in working group 1 of NTM, which consists of representatives from the organisations that are members of NTM. All work is based on voluntary contributions from the representatives. Data was obtained for energy use and emissions to air, both from the traffic systems and the energy supply systems (i.e. oil refining and electricity generation)</p> <p>The ambition was to present a span constructed by a "low", an average and a "high" value since the energy use and emissions to air in real traffic situations may vary greatly. These differences were calculated as differences in fuel and electricity consumption for the technology in use today. Where available, measurement data for regular traffic would be reported. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NTM.

<b>Practitioner</b>	- Swedish haulages and transport companies .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.</p> <p>The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.</p> <p>The age categories of the vehicles compiled in the work are:  Older than 1990,  Euro 0: Introduced 1987, law from 1990  Euro 1: Introduced 1991, law from 1993  Euro 2: Introduced 1993, law from 1996  However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.</p> <p><b>Handling of goods</b>  The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)  Terminal based road transports generally consists of 1-3 parts:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.</p> <p>--Wholesale goods (&gt;1000 kg) are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --General goods (100-1000 kg) are generally handled via terminal. The goods may be both weight and volume limited  --Parcel goods (&lt;100 kg) are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used in terminal based transport systems in Sweden:</b>  --Parcel truck/van, max 3,5 tonnes is mainly used for transportation of parcels.  --Light truck, max 8 tonnes is used for local distribution, mainly in city traffic.  --Truck, max 18 tonnes is used for district distribution and local distribution in city traffic.  --Truck, max 24 tonnes is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.  --Heavy truck with trailer, max 60 tonnes is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.  --Truck with semi-trailer, max 42 tonnes is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p>

	<p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (&gt; 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The emission data of medium-sized and light trucks have been collected from certification values of new engines, driven according to fix driving cycles, e.g. ECR-49 (IVL and Mercedes).
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

<b>Commissioner</b>	- NTM.
<b>Practitioner</b>	- Swedish haulages and transport companies .
<b>Reviewer</b>	None, to be reviewed. -
<b>Applicability</b>	<p>The data should not be used for any detailed study of transport systems. More detailed information is needed in order to carry out such studies, e.g. regarding the vehicle -type -age and performance, fuel type, the nature of the goods, the utilisation level etc. For a specific transport, the company carrying out the transport should be contacted in order to get information on how the goods are handled and how the transport is carried out.</p> <p>Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over a longer period of time (e.g. a year) is needed, e.g. in</p>

a transport contract. In such a case, different types of vehicles and utilisation levels may have occurred.

The standard values presented in this activity should not be used if specific information on the fuel consumption for the transport is available. In this case, the fuel consumption should instead be used as a basis to calculate the emissions from the transport. See General QMetaData for emission factors that can be used to calculate emissions per litre fuel used.

The age categories of the vehicles compiled in the work are:

Older than 1990,

Euro 0: Introduced 1987, law from 1990

Euro 1: Introduced 1991, law from 1993

Euro 2: Introduced 1993, law from 1996

However, in order to improve the accuracy of the calculations, the user ought to know the Euro-class (emission standards) of the vehicle, rather than to base the calculations on the age of the vehicle.

### **Handling of goods**

The data presented by NTM is representative for a terminal based transport system. The vehicles can be used in different ways, primarily altering the degree of utilisation. Several other types of road based cargo transport systems is not well described by the data (e.g. oil and excavated materials)

Terminal based road transports generally consists of 1-3 parts:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles while the inter-terminal traffic is operated by larger units, typically with a higher degree of utilisation.

--*Wholesale goods (>1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (<100 kg)* are normally handled in small vehicles

### **The following vehicles and equipages are used in terminal based transport systems in Sweden:**

--*Parcel truck/van, max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (styckegods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is *only used for Swedish domestic long-distance transport*. The vehicle is also permitted in Finland.

--*Truck with semi-trailer, max 42 tonnes* is used for international long-distance traffic.

### **Utilisation level**

The data is only applicable for an utilisation level of 70 % for long distance transport and 50 % for local distribution and regional transport, which is considered representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip, due to specialised vehicles). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than smaller firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

### **Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

### **Fuel**

The fuel used is diesel environmental class 1, except for petrol driven delivery vans who are assumed to use standard unleaded petrol. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (> 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbonhydrate and NOx emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the

	<p>data. NGM propose that data from Blinge et. al (Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997) should be used. This study is based on best available technology and Swedish conditions which is likely to yield a low figure.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. This will alter both the SOx emission and the regulated engine emissions. Generally the fleets in western Europe is composed of newer vehicles than in Sweden. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	The emission data of medium-sized and light trucks have been collected from certification values of new engines, driven according to fix driving cycles, e.g. ECR-49 (IVL and Mercedes).
<b>Notes</b>	<p>The person stated as "Practitioner" is the contact person for the data for truck transportation in NTM.</p> <p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NTM will continue to further increase the knowledge of different environmental interventions associated with goods transportation.</p> <p>The major Swedish actors in the transportation business, which are members of NTM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for NTM is Anna Hadenius, TFK - Transport Research Institute, Stockholm.</p>

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport</p>

	<p>companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:  BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Larson, Lars-Gunnar - FFA (Flygtekniska försöksanstalten), Box 11021 S-161 11 Bromma Sweden.
<b>Reviewer</b>	
<b>Applicability</b>	<p>!The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigoods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is <i>only used for Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):  -excavated materials and round timber - 50%  -manufactured products (wholesale goods) - slightly more than 20%  -provisions and animal forage - approx. 15%  -mixed cargo (general goods) approx - 10 %.</p> <p><b>Bulky goods</b>  The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b>  The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute,</p>

	<p>the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NOx emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>The data for emissions is based on emission factors. The origin of the emission factors is not specified. This means that several parameters that influence the energy use and emissions in regular traffic are probably not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM  
-----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of

	<p>organisations that participate in the work:  BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>!The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b>  Road transports generally consists of 1-3 routes:  1. Collection of the goods to terminal  2. Long-distance transport between terminals  3. Distribution of the goods from terminal  The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.  --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited  --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b>  --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels.  --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic.  --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic.  --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.  --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.  --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b>  <i>The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</i></p> <p><i>The utilisation level includes both weight and volume limited goods, but not empty trips. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</i>  --<i>excavated materials and round timber - 50%</i>  --<i>manufactured products (wholesale goods) - slightly more than 20%</i>  --<i>provisions and animal forage - approx. 15%</i>  --<i>mixed cargo (general goods) approx - 10 %.</i></p> <p><b>Bulky goods</b>  <i>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</i></p>
<b>About Data</b>	<p>The data for emissions is based on emission factors. The origin of the emission factors is not specified. This means that several parameters that influence the energy use and emissions in regular traffic are probably not considered, e.g. climate, topography, driving technique, maintenance etc. Since exhaust emissions depend on the engine speed and load conditions,</p>

	the emissions in actual operation may vary substantially.
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Light truck, max 8 tonnes, future

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Light truck, max 8 tonnes, future
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven light truck with engine representing best available technology (proposed Euro 3 environmental standard) with oxidation filter and catalytic control. The vehicle is mainly used for local distribution, mainly in city traffic.</p> <p>Maximum gross weight: 8 tonnes.  Kerb weight: 5 tonnes.  Available loading capacity with regard to weight: 3 tonnes.  Length: 7 metres.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents best available technology, not yet in regular use.

<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by a new test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level. See specific QMetaData for each flow.
<b>Literature Reference</b>	Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Waste Management International, Landfill Gas Data, Waste Management International, London, 1994 Perry and Green, The Chemical Engineer's Handbook, McGraw Hill, 1997.
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

<b>Flow Table and Specific Meta Data</b>									
<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>
	Input	Cargo	Cargo	1			tonne	Technosphere	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b></p> <p><i>Assumptions given by the Swedish Road Haulage Association:</i> -Average fuel consumption: 0,27 l/km.</p> <p>-Utilisation level: 70 %, of the available loading capacity with regard to weight.</p> <p><i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l</p> <p>-Sulphur content: 10 ppm</p> <p><i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine</p> <p>-maximum value: 1,01 in relation to the average engine</p>	Input	Refined resource	Diesel environmental class 1	4.32			MJ	Technosphere	
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NOx	Output	Emission	CO	0.049			g	Air	

<p>Date conceived: 1997-01-01  Data type: Derived, unspecified  Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel.  <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association:  -Average fuel consumption 0,27 l/km.  -Utilisation level: 70 %, of the available loading capacity with regard to weight.  Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute: -Thermal value: 43,43 MJ/kg  -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel  See QMetaData for the Diesel flow for further information</p>	Output	Emission	CO2	315			g	Air	
<p>Method: See QMetaData for NOx</p>	Output	Emission	HC	0.049			g	Air	
<p>Date conceived: 1996-01-01  Data type: Derived, unspecified  Method: The emissions per tonkm were calculated using emission factors (g/kWh) obtained by a new test cycle, on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The tests was performed by Motortestcenter. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)/l]*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)])/ (loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association:  -Average fuel consumption 0,27 l/km  -Utilisation level: 70 %, of the available loading capacity with regard to weight.  Data for the fuel, diesel environmental class 1: Thermal value: 43,43 MJ/kg  Density: 0,81 kg/l Sulphur content: 10 ppm  The data were supplied by the Swedish Petroleum Institute <i>The emission factors were:</i> -NOx 6,3 g/kWh  -HC 0,4 g/kWh -CO 0,7 g/kWh  -Particles 0,11 g/kWh -Degree of efficiency on the engine: 41 % (assumption). The data can be found in Ahlvik.  Literature: Ahlvik P., Almén J., Grägg K., Laveskog A. <i>Avgasemissioner med alternativa bränslen</i> Motortestcenter, februari 1996 (Published in SOU 1996:184 <i>Bilagor till betänkande av alternativbränsleutredningen</i>)</p>	Output	Emission	NOx	2.5			g	Air	
<p>Method: See QMetaData for NOx</p>	Output	Emission	Particles	0.0098			g	Air	
<p>Date conceived: 1997-01-01  Data type: Derived, unspecified  Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel  <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association:  -Average fuel consumption: 0,27 l/km.  -Utilisation level: 70 %, of the available loading capacity with regard to weight. Flow Data	
General Activity QMetadata	

<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, <i>the maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO <sub>2</sub> and SO <sub>2</sub> is based on the fuel consumption. For <i>emissions of NO<sub>x</sub>, HC, particles and CO</i> , the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation, the <i>maximum value</i> refer to an engine run 500 000 km. No minimum value was given.
<b>Literature Reference</b>	Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Waste Management International, Landfill Gas Data, Waste Management International, London, 1994 Perry and Green, The Chemical Engineer's Handbook, McGraw Hill, 1997.
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

-----

### Intended User

Suppliers and buyers of goods

### General Purpose

There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.

The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work:  
BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen

### Detailed Purpose

The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use. The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.

### Applicability

The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.

#### Handling of goods

Road transports generally consists of 1-3 routes:

1. Collection of the goods to terminal
2. Long-distance transport between terminals
3. Distribution of the goods from terminal

The collection and distribution routes are generally performed by smaller vehicles

--*Wholesale goods (> 1000 kg)* are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport.

--*General goods (100-1000 kg)* are generally handled via terminal. The goods may be both weight and volume limited

--*Parcel goods (< 100 kg)* are normally handled in small vehicles

**The following vehicles and equipages are used for transportation in Sweden:**

--*Truck max 3,5 tonnes* is mainly used for transportation of parcels.

--*Light truck, max 8 tonnes* is used for local distribution, mainly in city traffic.

--*Truck, max 18 tonnes* is used for district distribution and local distribution in city traffic.

--*Truck, max 24 tonnes* is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods.

--*Heavy truck with trailer, max 60 tonnes* is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for Swedish domestic long-distance transport. The vehicle is also permitted in Finland.

--*Truck with semitrailer, max 42 tonnes* is used for international long-distance traffic.

**Utilisation level**

The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.

The utilisation level includes both weight and volume limited goods, but *not empty trips*. During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):

- excavated materials and round timber - 50%
- manufactured products (wholesale goods) - slightly more than 20%
- provisions and animal forage - approx. 15%
- mixed cargo (general goods) approx - 10 %.

**The Swedish fleet**

The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:

After 1996: 10 %  
 95-92: 33%  
 Before 1992 52 %

The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.

**Bulky goods**

The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.

**Fuel**

The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.

Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.

**International road transports**

The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.

#### About Data

Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.

Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.

The data on emissions is largely based on tests on the engine performed in a laboratory according to a *standardised test cycle*. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle

	<p>that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Light truck, max 8 tonnes, manufactured before 1992 [Euro 0]

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1997-11-19
<b>Copyright</b>	NGM (Nätverket för Godstransporter och Miljön)
<b>Availability</b>	This version is only available to the members of NTM. The data is continuously updated, and the data user should always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a> .

Technical System	
<b>Name</b>	Light truck, max 8 tonnes, manufactured before 1992 [Euro 0]
<b>Functional Unit</b>	1 tonkm, 70 %
<b>Functional Unit Explanation</b>	Energy use and emissions refer to the transportation of 1 ton goods 1 kilometre for an utilisation level of 70 %. An utilisation level of 70 % is representative for Swedish domestic traffic if <i>empty trips are not included</i> .
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Land transport
<b>Owner</b>	Sweden
<b>Technical system description</b>	<p>Operation of a diesel driven light truck with engine manufactured before 1992 (Euro 0 environmental standard). The vehicle is mainly used for local distribution, mainly in city traffic.</p> <p>Maximum gross weight: 8 tonnes. Kerb weight: 5 tonnes. Available loading capacity with regard to weight: 3 tonnes. Length: 7 metres.</p>

## System Boundaries

<b>Nature Boundary</b>	<p>Regulated emissions to air are included. The parameters that are presented are:</p> <ul style="list-style-type: none"> <li>-regulated emissions for diesel engines: NOx, HC, particles and CO</li> <li>-fuel regulated: SO2</li> <li>-tax regulated CO2.</li> </ul> <p>Diffuse emissions to air, emissions to water and ground, noise, encroachment and other environmental loads have not been considered.</p>
<b>Time Boundary</b>	The data represents trucks with engine manufactured before 1992
<b>Geographical Boundary</b>	The data is based on Swedish conditions.
<b>Other Boundaries</b>	<p>The average utilisation level is 70 % which is representative for Swedish domestic traffic if <i>empty trips are not included</i>.</p> <p><i>Parameters not considered</i></p> <ul style="list-style-type: none"> <li>-Driving technique</li> <li>-External conditions i.e. road conditions, climate etc.</li> <li>-Maintenance level of the vehicle</li> </ul> <p><i>Excluded subsystems</i></p> <ul style="list-style-type: none"> <li>-Exhaust emission control</li> <li>-Precombustion, i.e. production and distribution of the fuel</li> <li>-Maintenance of the vehicle</li> <li>-Erection and operation of infrastructure</li> <li>-After-treatment of the vehicle</li> <li>-Handling of production rests</li> </ul>
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1997-01-01
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	NTM
<b>Method</b>	<p>The emissions were calculated using emission factors obtained by the ECE R49 test cycle, together with assumptions on the efficiency of the engine, fuel consumption, type of fuel used and utilisation level (see specific QMetaData for a description on methods used for each flow). The <i>quantity value for the energy use</i> refer to average fuel consumption, the <i>maximum and minimum value</i> refer to changes in the efficiency of the engine due to degeneration. The emissions of CO2 and SO2 is based on the fuel consumption. For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to voluntary European emission regulations for diesel engines before 1992.</p>
<b>Literature Reference</b>	Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Waste Management International, Landfill Gas Data, Waste Management International, London, 1994 Perry and Green, The Chemical Engineer's Handbook, McGraw Hill, 1997.
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

<b>Flow Table and Specific Meta Data</b>									
<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>
	Input	Cargo	Cargo	1			tonne	Technosphere	
<p>Date conceived: 1997-01-01</p> <p>Data type: Unspecified, expert outspoke</p> <p>Method: The diesel consumption per tonkm was calculated using assumptions on average fuel consumption (l/km) and utilisation level. The fuel is assumed to be diesel, environmental class 1. The minimum and maximum value is based on assumptions on changes in the efficiency of the engine due to degeneration. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption: 0,27 l/km.</p>	Input	Refined resource	Diesel environmental class 1	4.52	4.49	4.58	MJ	Technosphere	

-Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1, given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>Change of efficiency of the engine (based on assumptions):</i> -minimum value: 0,99 in relation to the average engine -maximum value: 1,01 in relation to the average engine									
	Output	Cargo	Cargo	1			tonne	Technosphere	
Method: See QMetaData for NOx	Output	Emission	CO	0.7		5.9	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the carbon content in the diesel. <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,27 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm -CO2 emission: 73 g/MJ fuel See QMetaData for the Diesel flow for further information	Output	Emission	CO2	330	328	334	g	Air	
Method: See QMetaData for NOx	Output	Emission	HC	0.73		1.24	g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emissions per tonkm were calculated using emission factors obtained by a standardised test cycle, ECE R49 on the engine. The emission factors are given in g/kWh, where kWh refers to mechanical work done by the engine. The quantity value refer to an average engine guaranteed by Volvo Truck Corporation, the maximum value refer to voluntary European emission regulations for diesel engines before 1992. No minimum value was given. <i>The following formula was used to calculate the emissions per tonkm:</i> (Average fuel consumption [l/km]*thermal value[kWh (fuel)]/l)*efficiency [kWh(engine)/kWh(fuel)]*emission factor [g/kWh(engine)]/(loading capacity [tonne]*utilisation level) <b>The following data was used in the calculations:</b> Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,27 l/km -Utilisation level: 70 %, of the available loading capacity with regard to weight. <i>Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute:</i> -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm <i>The emission factors were: Quantity value, i.e. average engine::</i> -NOx 11 g/kWh -HC 1,5 g/kWh -CO 1,5 g/kWh -Particles 0,4 g/kWh (estimated) -Degree of efficiency on the engine: 39 % (assumed) The data was supplied by the Volvo Truck Corporation. <i>Maximum value, i.e.</i>	Output	Emission	NOx	5.4	4.4	6.9	g	Air	

voluntary European emission regulations: -NOx 14 g/kWh -HC 2,5 g/kWh -CO 12 g/kWh -Particles - g/kWh (not given) -Degree of efficiency on the engine: 39 %. No minimum value was given. <i>The ECE R49 is a steady state cycle for heavy duty truck engines.</i> Consists of a sequence of 13 constant engine speed and load modes. Emissions are analysed for each test mode. Then the overall emission result is calculated as a (weighted) average from all test modes. The cycle is characterised by high average engine load and high exhaust gas temperature. Notes: Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially.									
Method: See QMetaData for NOx	Output	Emission	Particles	0.2			g	Air	
Date conceived: 1997-01-01 Data type: Derived, unspecified Method: The emission per tonkm was calculated from the fuel consumption using the sulphur content in the diesel <i>The following data was used in the calculations: Assumptions given by the Swedish Road Haulage Association: -Average fuel consumption 0,27 l/km. -Utilisation level: 70 %, of the available loading capacity with regard to weight. Data for the fuel, diesel environmental class 1 given by the Swedish Petroleum Institute: -Thermal value: 43,43 MJ/kg -Density: 0,81 kg/l -Sulphur content: 10 ppm See QMetaData for the Diesel flow for further information</i>	Output	Emission	SO2	0.00208	0.00205	0.00213	g	Air	

About Inventory	
<b>Publication</b>	<p><i>Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997</i></p> <p>-----</p> <p>Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology</p> <p>Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM</p> <p>-----</p>
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use</p>

	today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.

For <i>emissions of NOx, HC, particles and CO</i>, the <i>quantity value</i> refer to an average engine guaranteed by Volvo Truck Corporation and the <i>maximum value</i> refer to the emission regulations for diesel engines according to the emission standard Euro I.</p>
<b>Literature Reference</b>	Integrated Waste Management - a Life Cycle Inventory, F. McDougall et al, Procter & Gamble Technical Centres Limited, Blackwell Science, 2001 Waste Management International, Landfill Gas Data, Waste Management International, London, 1994 Perry and Green, The Chemical Engineer's Handbook, McGraw Hill, 1997.

**Notes**

Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

**Flow Table and Specific Meta Data**

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography

## About Inventory

### Publication

Energi- och emissionsuppgifter för godstransporter i Sverige. Ett konsensusdokument för övergripande jämförelser mellan transportslagen, Lägesbeskrivning november 1997, NGM (Nätverket för Godstransporter och Miljön), (In Swedish) 1997

-----  
Data documented by: Ann-Christin Pålsson, CPM/TEP, Chalmers University of Technology

	Documentation reviewed by: Michael Björkman, BTL (Bilspedition Transportation and Logistics), contact person for road transports in the work of NGM -----
<b>Intended User</b>	Suppliers and buyers of goods
<b>General Purpose</b>	<p>There is an interest to compare different modes of transportation according to a joint basis. In order to be able to make correct assessments, it is crucial to have a thorough knowledge of the different function, assumptions and environmental load of different modes of transportation. The ambition within NGM (Network for goods transportation and the environment) is to compile and document all relevant environmental interventions associated with all modes of goods transportation, and to localise gaps of knowledge. The work is also intended to serve as a forum for discussion between different actors in the transportation business.</p> <p>The members of NGM consists of organisations representing road, rail, air and sea transport companies, interest groups, authority, university, research institutes etc. Example of organisations that participate in the work: BTL (Bilspedition Transportation and Logistics), ASG, SJ, FFA (The Aeronautical Research Institute of Sweden), Swedish Shipowners' Association, The Swedish Road Haulage Association, The Swedish Environmental Protection Agency, Vägverket, Sjöfartsverket, Department of Transportation and Logistics at Chalmers University of Technology, Naturskyddsföreningen</p>
<b>Detailed Purpose</b>	<p>The first step in the work of NGM was to gather available data for energy use and emissions for the operation of different modes of goods transportation. The work is conducted in working group 1 of NGM, which consists of representatives from the organisations that are members of NGM. All work is based on voluntary contributions from the representatives.</p> <p>The ambition was to present data for the "best", average and "worst" technology in use today. Where available, data for regular traffic would be reported, since the energy use and emissions in real transportation situations may vary greatly. The aim was also to get a picture of future energy use and emissions from transportation, through best available technology and future regulations, not yet in use.</p>
<b>Commissioner</b>	- NGM (Nätverket för Godstransporter och Miljön), c/o TFK, Box 12667, S-112 93 Stockholm, Sweden.
<b>Practitioner</b>	Björkman, Michael - BTL (Bilspedition Transportation and Logistics), 412 97 Göteborg .
<b>Reviewer</b>	
<b>Applicability</b>	<p>The data should not be used for detailed study of transportation. More detailed information is then needed e.g. regarding the vehicle performance, the nature of the goods, the utilisation level etc. For specific transports, the company carrying out the transport should be contacted to get information on how the goods are handled and the transport is carried out.</p> <p><b>Handling of goods</b> Road transports generally consists of 1-3 routes: 1. Collection of the goods to terminal 2. Long-distance transport between terminals 3. Distribution of the goods from terminal The collection and distribution routes are generally performed by smaller vehicles</p> <p>--<i>Wholesale goods (&gt;1000 kg)</i> are generally not handled via terminal. The goods is collected by a truck and driven straight to the customer. The truck may however collect a trailer at the terminal for further transport. --<i>General goods (100-1000 kg)</i> are generally handled via terminal. The goods may be both weight and volume limited --<i>Parcel goods (&lt;100 kg)</i> are normally handled in small vehicles</p> <p><b>The following vehicles and equipages are used for transportation in Sweden:</b> --<i>Truck max 3,5 tonnes</i> is mainly used for transportation of parcels. --<i>Light truck, max 8 tonnes</i> is used for local distribution, mainly in city traffic. --<i>Truck, max 18 tonnes</i> is used for district distribution and local distribution in city traffic. --<i>Truck, max 24 tonnes</i> is mainly used for transportation of general (stykkegoods) and wholesale (partigods) goods. --<i>Heavy truck with trailer, max 60 tonnes</i> is used for long distance transports. The towcar for the equipage is a truck, max 24 tonnes. The vehicle is not permitted in the EU and is only used for <i>Swedish domestic long-distance transport</i>. The vehicle is also permitted in Finland. --<i>Truck with semitrailer, max 42 tonnes</i> is used for international long-distance traffic.</p> <p><b>Utilisation level</b> The data is only applicable for a utilisation level of 70 % which is representative for Swedish transports according to the Swedish Road Haulage Association and the firms of haulage that has participated in the work. It should however be noted that the average utilisation level might vary between different types of goods and firms of haulage. There are however no general rules on how to assess the utilisation level for a specific transport. There are some types of goods (e.g. timber and chemicals) that generally have an utilisation level of 50 % (i.e. full load one way and empty return trip). There may also be regional differences. The major shipping agents may be assumed to have a higher utilisation level than independent firms of haulage. The utilisation of company internal vehicles is generally low.</p> <p>The utilisation level includes both weight and volume limited goods, but <i>not empty trips</i>.</p>

	<p>During 1996 24 % of all transports were empty transports. Most of the empty transports (90%) were performed on distances shorter than 100 km. The share of empty trips for different types of goods during 1996 were according to SCB (Statistics Sweden):</p> <ul style="list-style-type: none"> <li>-excavated materials and round timber - 50%</li> <li>-manufactured products (wholesale goods) - slightly more than 20%</li> <li>-provisions and animal forage - approx. 15%</li> <li>-mixed cargo (general goods) approx - 10 %.</li> </ul> <p><b>The Swedish fleet</b></p> <p>The data for different age categories of vehicles (before 92, 1992-1995, after 96) may be used to calculate average energy use and emissions for a specific fleet or the average Swedish fleet of vehicles regarding age distribution. In Sweden, 1996 the following shares of transportation work was carried out by the different age categories:</p> <p>After 1996: 10 %  95-92: 33%  Before 1992 52 %</p> <p>The data was given by SIKa and SCB and concern vehicles larger than 3,5 tonnes.</p> <p><b>Bulky goods</b></p> <p>The data may be used for bulky goods by recalculation of the volume to an equivalent weight by the following conversion factor: 250 kg/m<sup>3</sup>. The conversion factor is generally accepted in the transportation business.</p> <p><b>Fuel</b></p> <p>The fuel used is diesel environmental class 1. According to the Swedish Petroleum Institute, the major part of all diesel fuel oil sold at present time is of class 1 (about 85% at June 1996). Class 1 diesel oil has the lowest aromatic carbon and nitrogen content of all diesel oil sold in Sweden, resulting in lower particle, carbohydrate and NO<sub>x</sub> emissions.</p> <p>Precombustion, i.e. extraction, refining and distribution of the fuel are not included in the system. NGM propose that data from Blinge et al Arnäs, P-O, Blinge, M., Bäckström, S., Furnander, Å. "Livscykelanalys av drivmedel - En studie med utgångspunkt från svenska förhållanden och bästa tillgängliga teknik", Meddelande 95, Department of Transportation and Logistics, Chalmers University of Technology, 1997 should be used. This study is based on best available technology and Swedish conditions.</p> <p><b>International road transports</b></p> <p>The data may be used for international transport if the data is recalculated for diesel environmental class 3. Generally the fleets in Europe is composed of older vehicles. The utilisation of the vehicles may also vary in different countries.</p>
<b>About Data</b>	<p>Several parameters that have a large influence on the energy use and emissions in regular traffic are not considered, e.g. climate, topography, driving technique, maintenance etc.</p> <p>Also, no considerations have been taken for differences in fuel consumption between different age models of vehicles. The fuel consumption for newer models are however lower. According to Greger Juhlin at Scania, the fuel consumption for heavy trucks in highway traffic has decreased from 5,7 l/km to 4 l/km during the last 15 years.</p> <p>The data on emissions is largely based on tests on the engine performed in a laboratory according to a <i>standardised test cycle</i>. Since exhaust emissions depend on the engine speed and load conditions, the emissions in actual operation may vary substantially. The test cycle that was used (ECE R49) is developed to represent long-distance traffic. The test cycle is thus not representative for traffic situations with extensive variations on the load conditions.</p> <p>A sulphur content of 10 ppm in the fuel are assumed in the calculations, which is the maximum allowed sulphur content for diesel environmental class 1. The average sulphur content in the fuel sold in Sweden is however lower: 2 ppm +/- 0,5 ppm according to the Swedish Petroleum Institute.</p> <p>The model to calculate the emissions may be used to represent a specific transport or firm of haulage contractors if the age of the vehicle, the fuel use for the transport, the distance and the utilisation level is known (see QMetaData).</p>
<b>Notes</b>	<p>The data is continuously updated, and the data user should therefore always make sure to use the most recent version of the data, which is published on the NTM homepage: <a href="http://www.ntm.a.se">http://www.ntm.a.se</a>.</p> <p>The work within NGM will continue to further increase the knowledge of different environmental interventions associated with goods transportation. The representatives for road transports (e.g. Volvo, Scania, Bilindustriföreningen, BTL Åkeriförbundet etc.) are currently compiling new data on energy use and emissions from road transports which is expected to be available in the end of February 1997. SJ and Vattenfall AB are working on new data on the environmental load of electricity production which also will be available at the end of February 1998.</p> <p>The major Swedish actors in the transportation business, which are members of NGM (e.g. SJ, BTL, ASG etc.), will use the data as a basis for environmental assessment of different transportation alternatives.</p> <p>The secretary for the work is Sebastian Bäckström, Department of Transportation and Logistics at Chalmers University of Technology.</p>

## SPINE LCI dataset: Lignite electricity energy system, EPD-version

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1996-10
<i>Copyright</i>	Bundesamt für Energie, Bern
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Lignite electricity energy system, EPD-version
<i>Functional Unit</i>	1 TJ net electricity from power plant
<i>Functional Unit Explanation</i>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<i>Process Type</i>	Cradle to grave
<i>Site</i>	UCTPE countries Europe
<i>Sector</i>	Grid electricity and district heat
<i>Owner</i>	UCTPE countries Europe
<i>Technical system description</i>	<p>Reported figures are based on data from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996 and adapted to the demands of the EPD-guidelines (Environmental Product Declaration guidelines in Sweden).</p> <p>-- Brief description --</p> <p>The main phases inventoried in ETH's life cycle study of electricity generation with lignite are: mining, transports and power plant operation.</p> <p>Data has been acquired from literature and figures concerning consumption of energyware and materials, use of land and water, emissions to air (also radioactive) and water and wastes have been picked out from or calculated based on literature for all phases of the life cycle.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle.</p> <p>-- Detailed description --</p> <p><b>Mining</b> The prospecting of lignite implies test drillings etc but is not inventoried separately since only a few millimeters of drilling per tonne lignite is needed. Mining depths are mostly less than 200 m but may reach 600 m. Noise (not quantified in this study), radioactive radon, methane and particles are process specific emissions to air and subsoilwater to water. Open pit mining (94% of used lignite in UCPTE) is studied. For the UCPTE average underground mining has been estimated and added. Two to six times the amount of lignite must be dug out, i.e. large strong machines are needed. Mainly electrified mobile machines are used, often supplied by a nearby lignite power plant (but UCPTE electricity generation mix has been used in the calculations) but also diesel driven machines. Lower heating value of lignite used in UCPTE power plants has an average of 7,9 GJ/tonne lignite. The subsoil water level must be lowered below the seam. Construction and operation of mines have been inventoried. Demolition processes imply depositing of wood and concrete and metalscrap is assumed to be transported to recycling plants.</p> <p><b>Transports</b> Extracted lignite is transported to nearby power plants on feeder bands, by lorry or train. No processing of lignite is needed.</p> <p><b>Power plant</b> Construction and area use has been inventoried for two standard plants (100 and 500 MWe). The smaller standard plant is equipped with electrofilter and wet desulphuring with lime or limestone, the larger plant has a SCR de-NOx device as well. 70% of the UCPTE lignite power plants belong to the 500 MWe class. Combined heat and power is not studied,</p>

i.e. all generated electricity is supposed to come from lignite condensing plants (electricity from CHPs is less than 5% of UCPTÉ electricity generation). The plants are base load power plants with an average of 6000 h of operation per year. Furnace technology is conventional (i.e. no gasifiers or fluid beds). Average efficiencies of UCPTÉ power plants have been calculated (30.9%) based on national statistics. Incoming coal (average heating value 8 MJ/kg) is mixed, grinded and dried. Furnace temperatures of 1,300°C giving fly ashes or 1,600°C leading to ash melting are used. Concerning conventional emissions to air national statistics and bottom-up calculations based on existing UCPTÉ power plants have been used. Emissions of trace elements are estimated and other emissions are calculated based on literature data. Leaching of substances from deposited ashes is included.

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

## System Boundaries

### *Nature Boundary*

Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).

ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.

Vattenfall's criterion in selecting and aggregating ETH's LCI-results for electricity generation in the UCPTÉ region has been to make the figures usable as general electricity LCI data in EPDs according to Miljöstyvningsrådets guidelines.

Especially parameters (emissions) which have established impact indices - accepted by the EPD system - for one or several environmental impact categories, have been picked out and aggregated as far possible. But also metal and energyware resources have been included, as well as waste, in spite of all waste handling processes related to this dataset being included with respect to use of resources and emissions. The latter is an adaption to other LCI data for electricity generation where waste amounts are reported (since those flows have not been followed to the grave).

Since ETH claims that most of the figures regarding metal emissions have an undefined amount of datagaps all metal emissions are aggregated except for a few which are specified separately since they are reported for most processes in the lifecycle. Metals are reported as elements although they often are part of compounds. Measuring methods often just give the amounts of the different elements found.

All hydrocarbons to water are aggregated to one parameter as well as halogenated organics, since no indices exist (that are accepted by the EPD system so far) for characterisation of the individual substances.

### *Time Boundary*

Most background data refer to the period 1990 to 1994. Concerning flue gas cleaning equipment data from 1995/96 has been used where possible. Figures regarding use of materials and mining and processing of coal are older which probably doesn't affect the result much. Future emissions from deposits for filter ashes are included.

Power plant operation is based on the year 1994.

Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTÉ\* countries between 1990-94 (to level off the large variations in hydro power production over the years).

All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.

Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:

Equipment in mines 30 years  
Power plant 30 years

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

### *Geographical Boundary*

Figures are based on average lignite power plants in Austria, Germany, Spain, Ex-Yugoslavia, France and Greece.

Lignite mining has been studied in the UCPTÉ since less than 1% is imported. 67% of lignite used in UCPTÉ is mined in Germany.

Processes conducted outside the UCPTÉ\* region are supposed to be supplied with UCPTÉ\*

	<p>electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Other Boundaries</b>	<p>Data concerning material and energyware use in the construction phase of the mine are rough estimates based on a few real mines. Process specific (i.e. not energyware related) emissions to air from mines have not been included except for radon, methane and particles. The flow of substances in subsoil water is not complete. Use and emissions of lubricating and hydraulic oil is not included. Losses of lignite in the mining area has not been accounted for.</p> <p>Losses of lignite during transport or reloading has not been accounted for.</p> <p>Accidents and filter failures are not considered in the power plant. Most data concerning the power plant are based on assumptions and estimates.</p> <p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTTE electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH's LCA for coal power.</p> <p>The ETH study comprises figures concerning use of land, usable content in water storages and amount of turbine water which have not been reported here. The two latter have been excluded due to lack of corresponding data in comparable studies.</p> <p>Use of land has been excluded here because of ETH's advanced approach. Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.</p> <p>Land Criterion Category          Natural human impact not larger than other species' since the industrial revolution I          Modified human impact larger than other species', low degree of cultivation II          Cultivated human impact larger than other species', large degree of cultivation III          Built upon dominated by buildings, roads, dams, mines etc. IV</p> <p>Category I is not used in the study.</p> <p>State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.</p> <p>ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m<sup>2</sup>/year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below:          From category IV to category III 5 years          From category III to category II 50 years          From category II to category I 100 000 years</p> <p>(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)</p> <p>ETH specifies about 160 radioactive isotopes emitted to air and water. Radioactive emissions reported here are picked out in accordance with SETAC working group report on data quality and data availability (to be published in 2001).</p> <p>Big accidents occurring seldomly are not included. The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1985 to 1995
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with lignite in the UCTPE countries.

<b>Method</b>	The data has been adapted from the Ökoinventare von Energiesystemen, ETH Zürich 1996 and is an aggregation of the LCI results for the module "electricity of lignite power plant UCPTÉ" (Strom ab Braunkohlekraftwerk UCPTÉ-Mix).
<b>Literature Reference</b>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<b>Notes</b>	Calculating the environmental impact in relation to transport work and utilisation level is most appropriate if a calculation over the year is needed, e.g. in a transport deal, which often covers a year's time. In such a case, different types of vehicles and utilisation levels may have occurred.

	Output	Product	Electricity	1			TJ	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) and processing of hazardous waste is included.	Output	Residue	Hazardous waste	1.57E+01			kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Highly radioactive waste	1.62E-05			m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, no emissions from landfill assumed. Inert waste deposit is waste at landfill that are inert.	Output	Residue	Inert waste deposit	1.27E+03			kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Low radioactive waste	1.97E-04			m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included.	Output	Residue	Medium and low radioactive waste	1.98E-04			m3	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from landfill. Reactive waste deposit is waste at landfill that is still reactive.	Output	Residue	Reactive waste deposit	4.70E+04			kg	Technosphere	

Notes: Internal flow! Infrastructure of spreading vehicles and emissions are included. Land farming is a treatment of organic sludge, the sludge is spread on a piece of land and left to degrade. Sometimes plants are grown on the land, but those plants are destroyed.	Output	Residue	Waste in land farming	3.56E+00			kg	Technosphere	
Notes: Internal flow! Infrastructure (resources and emissions) included, as well as emissions from incineration plant.	Output	Residue	Waste to incineration	4.08E-01			kg	Technosphere	

About Inventory	
<b>Publication</b>	<p>Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at <a href="http://www.energieforschung.ch">http://www.energieforschung.ch</a>.</p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by (see also Notes): Rolf Frischknecht, ESU-services, Switzerland Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden -----</p>
<b>Intended User</b>	Original study of ETH: LCA pra
<b>General Purpose</b>	<p>The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their life cycles. The results can be used in life cycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.</p> <p>Vattenfalls purpose - as a commissioner of putting ETH:s data into Spine format with metadata - is to supply EPD-practitioners with general LCA-data for electricity generation to be used in absence of specific data in accordance with the directions of Miljöstylningsrådet (The Swedish Environmental Management Council) and the Swedish EPD-guidelines. Data is supposed to be used together with IEA statistics about electricity generation mixes in the OECD countries/regions.</p>
<b>Detailed Purpose</b>	ETH:s aim was to describe the average situation in the UCPTE concerning electricity generation with lignite. With the help of assumptions and simplifications following phases of the life cycle are described: mining (open pit), transports and power plant.
<b>Commissioner</b>	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
<b>Practitioner</b>	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .
<b>Reviewer</b>	None, see further under notes -
<b>Applicability</b>	<p>Data reported here is supposed to be representative for lignite based electricity generation in the UCPTE countries in 1994.</p> <p>This set of data is aggregated and documented in accordance with the Swedish EPD-guidelines to be used in combination with IEA statistics concerning electricity generation mixes in OECD countries and regions together with other datasets - based on the ETH study - describing other power generation systems.</p> <p>The EPD-adapted power generation systems in Spine format are named as follows: Fuel gas electricity energy system, EPD-version Biofuel electricity energy system, EPD-version Hydro electricity energy system, EPD-version Lignite electricity energy system, EPD-version Nuclear electricity energy system, EPD-version Stone coal electricity energy system, EPD-version Wind electricity energy system, EPD-version</p> <p>IEA statistics for generation mixes 1998 exist in Spine format for the following 30 countries/regions: OECD total OECD North America OECD Pacific OECD Europe European Union Australia Austria Belgium Canada Czech Republic</p>

	Denmark Finland France Germany Greece Hungary Iceland Ireland Italy Japan Korea Luxembourg Mexico Netherlands New Zealand Norway Poland Portugal Spain Sweden Switzerland Turkey United Kingdom United States
<b>About Data</b>	<p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided).</p> <p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.</p>
<b>Notes</b>	<p>Reviewer of this specification of ETH:s data and metadata has been:  Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of aggregation of figures and of Vattenfall's interpretation of the documentation  Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements.  The technical committee of the Swedish Environmental Management Council - approval of method and aggregation of parameters</p> <p>Project Management of the ETH study, 3rd edition:  Professor, Dr. P. Suter and R. Frischknecht, ETH</p> <p>Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH  R. Dones, E. Zollinger, Paul Scherrer Institut</p> <p>Authors of the 1st edition:  N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gränicer, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger  Authors of the revision, 3rd edition: U. Bollens, S. Bosshart, M. Ciot, L. Ciseri, G. Doka, R. Frischknecht, R. Hischer, A. Martin, ETH  R. Dones, U. Gantner, Paul Scherrer Institut</p> <p>-----  --- Changes made to the data set after publishing in SPINE@CPM---</p> <p>&gt;&gt;&gt; 6 June 2001: &lt;&lt;&lt;  Changes made by Ann-Christin Pålsson, CPM, based on discussions with Caroline Setterwall, Vattenfall AB.</p> <p>Comments:  The following changes has been made in the nomenclature for in- and outflows:  Mangane in ore -&gt; changed to: Manganese in ore  CH4 -&gt; changed to: Methane (to be in accordance with the nomenclature specified in CPM report 2000:2)  CN -&gt; changed to: CN-  Stone coal -&gt; changed to: Hard coal (to be in accordance with the nomenclature specified in CPM report 2000:2)  Other metals -&gt; changed to: Metals</p> <p>Explanations of nomenclature (inserted in Notes for the specific flows):  - CN- is Cyanide ion  - Reactive waste deposit is waste at landfill that is still reactive.  - Inert waste deposit is waste at landfill that are inert.</p> <p>Additional clarifications:  - Note that the flows of waste in the table of in- and outflows are internal flows, i.e. they do NOT cross the system boundaries. All waste handling processes is included in the study with respect to use of resources and emissions.  - Radioactive waste is accounted for in cubic metres. The product specific requirements for electricity and district heating generation (PSR 1998: 1) in the Swedish EPD system states that waste shall be accounted for in gram. However, no conversion factors were given in the study.</p>

## SPINE LCI dataset: Lignite electricity energy system, ETH - full version

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-10
<b>Copyright</b>	Bundesamt für Energie, Bern
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Lignite electricity energy system, ETH - full version
<b>Functional Unit</b>	1 TJ net electricity from power plant
<b>Functional Unit Explanation</b>	The generation of 1 TJ (1 000 000 000 000 J) net electricity (i.e. electricity need in the power plant has been supplied for by the plant itself). Electricity distribution and distribution losses are not accounted for, i.e. not for this particular unit process. Data about distribution and its losses may however be found in the original study.
<b>Process Type</b>	Cradle to grave
<b>Site</b>	UCTPE countries Europe
<b>Sector</b>	Grid electricity and district heat
<b>Owner</b>	UCTPE countries Europe
<b>Technical system description</b>	<p>Reported figures come from a LCI-study performed at ETH, Zürich and Paul Scherrer Institut, Villigen, "Ökoinventare von Energiesystemen", 3rd edition 1996.</p> <p>Brief description</p> <p>The main phases inventoried in ETH's life cycle study of electricity generation with lignite are: mining, transports and power plant operation.</p> <p>Data has been acquired from literature and figures concerning consumption of energyware and materials, use of land and water, emissions to air (also radioactive) and water and wastes have been picked out from or calculated based on literature for all phases of the life cycle.</p> <p>All subsystems are described on a "cradle-to-grave" basis, including the main stages, i.e. data concerning consumption of resources, waste handling and emissions is included for the manufacturing of main materials and energyware used in the lifecycle.</p> <p>Detailed description</p> <p><b>Mining</b> The prospecting of lignite implies test drillings etc but is not inventoried separately since only a few millimeters of drilling per tonne lignite is needed. Mining depths are mostly less than 200 m but may reach 600 m. Noise (not quantified in this study), radioactive radon, methane and particles are process specific emissions to air and subsoilwater to water. Open pit mining (94% of used lignite in UCPTE) is studied. For the UCPTE average underground mining has been estimated and added. Two to six times the amount of lignite must be dug out, i.e. large strong machines are needed. Mainly electrified mobile machines are used, often supplied by a nearby lignite power plant (but UCPTE electricity generation mix has been used in the calculations) but also diesel driven machines. Lower heating value of lignite used in UCPTE power plants has an average of 7,9 GJ/tonne lignite. The subsoil water level must be lowered below the seam. Construction and operation of mines have been inventoried. Demolition processes imply depositing of wood and concrete and metalscrap is assumed to be transported to recycling plants.</p> <p><b>Transports</b> Extracted lignite is transported to nearby power plants on feeder bands, by lorry or train. No processing of lignite is needed.</p> <p><b>Power plant</b> Construction and area use has been inventoried for two standard plants (100 and 500 MWe). The smaller standard plant is equipped with electrofilter and wet desulphuring with</p>

lime or limestone, the larger plant has a SCR de-NO<sub>x</sub> device as well. 70% of the UCPTÉ lignite power plants belong to the 500 MWe class. Combined heat and power is not studied, i.e. all generated electricity is supposed to come from lignite condensing plants (electricity from CHPs is less than 5% of UCPTÉ electricity generation). The plants are base load power plants with an average of 6000 h of operation per year. Furnace technology is conventional (i.e. no gasifiers or fluid beds). Average efficiencies of UCPTÉ power plants have been calculated (30.9%) based on national statistics. Incoming coal (average heating value 8 MJ/kg) is mixed, grinded and dried. Furnace temperatures of 1,300°C giving fly ashes or 1,600°C leading to ash melting are used. Concerning conventional emissions to air national statistics and bottom-up calculations based on existing UCPTÉ power plants have been used. Emissions of trace elements are estimated and other emissions are calculated based on literature data. Leaching of substances from deposited ashes is included.

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

## System Boundaries

### *Nature Boundary*

Used materials and energyware have been followed from extraction and processing of natural resources. Manufacturing processes for the use of recycled material are accounted for. Emissions from energyware use in manufacturing processes and transports (infrastructure and vehicle construction included) are considered as well as emissions from landfills (infrastructure included) where waste material is disposed of. Waste material supposed to be recycled are outputs of the system (i.e. those recycling processes are not included).

Land is divided into two main groups - land and sea - which are subdivided into 4 categories each.

#### Land Criterion Category

Natural human impact not larger than other species' since the industrial revolution I

Modified human impact larger than other species', low degree of cultivation II

Cultivated human impact larger than other species', large degree of cultivation III

Built upon dominated by buildings, roads, dams, mines etc. IV

Category I is not used in the study.

State of land before, during and after exploitation is of interest. If a piece of land is used again after some kind of exploitation it will either end up in the same category or in a higher one.

ETH takes into account not only the land used during the technical lifetime of the studied system but also during the construction phase and during the time it takes to restore the land. They express use of land in the unit m<sup>2</sup>/year which is different from comparable Swedish studies (m<sup>2</sup>). See times for restoration of land below:

From category IV to category III 5 years

From category III to category II 50 years

From category II to category I 100 000 years

(For uranium mines the restoration time to category II is 80'000 years due to elevated radiation caused by long-living radioactive compounds.)

ETH's LCI-results comprise all parameters received during inventory and calculation, i.e. no selection has been made by ETH.

### *Time Boundary*

Most background data refer to the period 1990 to 1994. Concerning flue gas cleaning equipment data from 1995/96 has been used where possible. Figures regarding use of materials and mining and processing of coal are older which probably doesn't affect the result much. Future emissions from deposits for filter ashes are included.

Power plant operation is based on the year 1994.

Electricity used during the lifecycle has been assumed to be a mix based on the average generation in the UCPTÉ\* countries between 1990-94 (to level off the large variations in hydro power production over the years).

All processes, also those conducted in the past, have been assumed to use average technology of the early nineties.

Different technical lifetimes/reference times for different parts and materials of the studied systems have been used as follows:

Equipment in mines 30 years

Power plant 30 years

\* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.

<b>Geographical Boundary</b>	<p>Figures are based on average lignite power plants in Austria, Germany, Spain, Ex-Yugoslavia, France and Greece.</p> <p>Lignite mining has been studied in the UCPTe since less than 1% is imported. 67% of lignite used in UCPTe is mined in Germany.</p> <p>Processes conducted outside the UCPTe* region are supposed to be supplied with UCPTe* electricity.</p> <p>Data concerning the use of resources, emissions and waste in connection with manufacturing processes mainly originate from sources in Switzerland, Germany and other western European countries.</p> <p>* Union pour la coordination de la production et du transport de l'électricité, following countries were members of the union in 1994: Belgium, Germany, France, Greece, Italy, Ex-Yugoslavia (Bosnia/Herzegovina, Croatia, Slovenia, and Rest-Yugoslavia), Luxemburg, Netherlands, Austria, Portugal, Switzerland, Spain.</p>
<b>Other Boundaries</b>	<p>Data concerning material and energyware use in the construction phase of the mine are rough estimates based on a few real mines. Process specific (i.e. not energyware related) emissions to air from mines have not been included except for radon, methane and particles. The flow of substances in subsoil water is not complete. Use and emissions of lubricating and hydraulic oil is not included. Losses of lignite in the mining area has not been accounted for.</p> <p>Losses of lignite during transport or reloading has not been accounted for.</p> <p>Accidents and filter failures are not considered in the power plant. Most data concerning the power plant are based on assumptions and estimates.</p> <p>Manufacturing processes of components and machines have been approximated with 50% of the energyware used to produce contained materials. Energyware figures concerning material production come from literature and have assumed to be a mix of 10% UCPTe electricity, 45% oil and 45% natural gas. This approximation has been confirmed in more thorough calculations in ETH:s LCA for coal power.</p> <p>Big accidents occurring seldomly are not included. The threshold is fixed at 10 accidents per year if one energy carrier/system (e.g. oil) would cover the entire primary energy demand of the world.</p>
<b>Allocations</b>	<p>The cutoff-method has been used for material use, i.e. 100% of the environmental load for virgin and recycled material used in the lifecycle is included whereas no environmental load has been considered for materials leaving the system to be recycled. Landfill processes and waste incineration, however, are included for waste arising during the lifecycle.</p>
<b>Systems Expansions</b>	

<b>Flow Data</b>	
<b>General Activity QMetaData</b>	
<b>Date Conceived</b>	1985 to 1995
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	Average electricity generation with lignite in the UCPTe countries.
<b>Method</b>	The figures have been copied from the module "Electricity of lignite power plant UCPTe" (Strom ab Braunkohlekraftwerk UCPTe-Mix) in the Ökoinventare von Energiesystemen, ETH Zürich 1996.
<b>Literature Reference</b>	Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz, Environmental Life-Cycle Inventories of Energy Systems An Environmental Database for the Accounting of Energy Consumption in Product Life-Cycle Assessment and the Comparative Assessment of Energy systems Prof. Dr. P. Suter, R. Frischknecht, et al Swiss Federal Institute of Technology, Zürich R. Dones, U. Gantner Paul Scherrer Institute, Villigen/Würenlingen
<b>Notes</b>	Multiple flows are reported for several emissions to air. This is because that in the original study emissions to air have been reported in three categories, indicated by one of the letters below following the substance name. - m = mobile (emissions from vehicles) - p = process (process specific emissions as for instance methane emissions during coal mining) - s = stationary (emissions from stationary combustion plants) This categorisation has however not been documented in this specification in the SPINE format.

About Inventory	
<b>Publication</b>	<p>Ökoinventare von Energiesystemen, Grundlagen für den ökologischen Vergleich von Energiesystemen und den Einbezug von Energiesystemen in Ökobilanzen für die Schweiz. ETH, Eidgenössische Technische Hochschule, Zürich, Gruppe Energie - Stoffe - Umwelt (ESU), Paul Scherrer Institut, Villigen/Würenlingen, Sektion Ganzheitliche Systemanalysen Available on CD-ROM with full documentation (in German) at <a href="http://www.energieforschung.ch">http://www.energieforschung.ch</a>.</p> <p>-----</p> <p>Data documented by: Caroline Setterwall, Swedpower, Vattenfall AB, Sweden</p> <p>Documentation reviewed by (see also Notes):  Rolf Frischknecht, ESU-services, Switzerland  Ann-Christin Pålsson, CPM, Chalmers University of Technology, Sweden  -----</p>
<b>Intended User</b>	Original study of ETH: LCA pra
<b>General Purpose</b>	The purpose of the ETH study was to examine a number of energy systems quantitatively and to the same extent with respect to environmental issues during their life cycles. The results can be used in life cycle assessments, as basis information in decisionmaking regarding environmental optimisation or in working with municipal energy plans.
<b>Detailed Purpose</b>	ETH:s aim was to describe the average situation in the UCPTE concerning electricity generation with lignite. With the help of assumptions and simplifications following phases of the life cycle are described: mining (open pit), transports and power plant.
<b>Commissioner</b>	BEW, PSEL - Bundesamt für Energiewirtschaft, Projekt- und Studienfonds der Elektrizitätswirtschaft .
<b>Practitioner</b>	Rolf Frischknecht et al - ETH, Eidgenössische Technische Hochschule, Institut für Energietechnik, Zürich and Paul Scherrer Institut, Sektion Ganzheitliche Systemanalyse, Villigen/Würenlingen .
<b>Reviewer</b>	None, see further under notes -
<b>Applicability</b>	Data reported here is supposed to be representative for lignite based electricity generation in the UCPTE countries in 1994.
<b>About Data</b>	<p>Material manufacturing processes have been inventoried with a low degree of exactitude (except for steel, cement, aluminium, copper, bitumen, and platinum group metals for which rather detailed LCI data are provided).</p> <p>Results are reported with three figures, but it is stated in the original source that this does not mean that accuracy is that high (Part III, p.16).</p> <p>For references and sources of reported figures see further under Function, Nature boundary, Geographical boundaries, Publication, Notes and General metadata.</p>
<b>Notes</b>	<p>Reviewer of this specification of metadata describing the ETH study has been:  Dr. Rolf Frischknecht, ESU-services (earlier at ETH) - approval of Vattenfall's interpretation of the documentation  Ann-Christin Pålsson, CPM - review of documentation quality according to the CPM data documentation requirements.</p> <p>Project Management of the ETH study, 3rd edition:  Professor, Dr. P. Suter and R. Frischknecht, ETH</p> <p>Editorial staff of the 1st edition: R. Frischknecht, P. Hofstetter, I. Knoepfel, M. Ménard, ETH  R. Dones, E. Zollinger, Paul Scherrer Institut</p> <p>Authors of the 1st edition:  N. Attinger, T. Baumann, G. Doka, R. Dones, R. Frischknecht, H.-P. Gränicer, C. Grasser, P. Hofstetter, I. Knoepfel, M. Ménard, H. Müller, M. Vollmer, E. Walder, E. Zollinger</p>

## SPINE LCI dataset: Limestone quarrying. ESA-DBP

Administrative	
<i>Finished</i>	Y
<i>Date Completed</i>	1996
<i>Copyright</i>	Environmental Systems Analysis, Chalmers Univ. of Technology
<i>Availability</i>	Public

Technical System	
<i>Name</i>	Limestone quarrying. ESA-DBP
<i>Functional Unit</i>	1kg of limestone
<i>Functional Unit Explanation</i>	Unknown
<i>Process Type</i>	Gate to gate
<i>Site</i>	Unknown
<i>Sector</i>	Mining and quarrying
<i>Owner</i>	Unknown
<i>Technical system description</i>	<p>Excerpt from the report, see 'Publication': "The process step to get limestone include excavation, crushing, grinding, sieving, washing and drying". The input for the process is a limestone rock.</p> <p>This process is included in the system described in: Thuresson J. (1996). Life Cycle Assessment of Water Pumps. Technical Environmental Planning, Report 1996:11 ISSN: 1400-9560. Chalmers University of Technology. Gothenburg, Sweden.</p> <p>Other processes in the CPM Database also included in the above publication:</p> <ul style="list-style-type: none"> <li>- Coal mining and cleaning. ESA-DBP</li> <li>- Cast iron production. ESA-DBP</li> <li>- Sand extraction and processing. ESA-DBP</li> <li>- Sinter plant's process ESA-DBP</li> <li>- Uranium ore extraction and enrichment. ESA-DBP</li> <li>- Production of pig iron - blast furnace process. ESA-DBP</li> </ul>

System Boundaries	
<i>Nature Boundary</i>	The inventory analysis included parameters describing resource use (energy and raw materials) emissions to air, emissions to water, and waste generation.
<i>Time Boundary</i>	1994
<i>Geographical Boundary</i>	Unknown
<i>Other Boundaries</i>	Unknown
<i>Allocations</i>	Unknown
<i>Systems Expansions</i>	Not applicable

Flow Data	
General Activity QMetadata	
<i>Date Conceived</i>	1994

<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'
<b>Method</b>	Adapted from the other report.
<b>Literature Reference</b>	Thuresson J. (1996). Life Cycle Assessment of Water Pumps. Technical Environmental Planning, Report 1996:11 ISSN: 1400-9560. Chalmers University of Technology. Gothenburg, Sweden. Data for particular process come from: Landbank Environmental Research & Consulting (1994), The Phosphate Report, Landbank
<b>Notes</b>	Multiple flows are reported for several emissions to air. This is because that in the original study emissions to air have been reported in three categories, indicated by one of the letters below following the substance name. - m = mobile (emissions from vehicles) - p = process (process specific emissions as for instance methane emissions during coal mining) - s = stationary (emissions from stationary combustion plants) This categorisation has however not been documented in this specification in the SPINE format.

About Inventory	
<b>Publication</b>	Thuresson J. (1996). Life Cycle Assessment of Water Pumps. Technical Environmental Planning, Report 1996:11 ISSN: 1400-9560. Chalmers University of Technology. Gothenburg, Sweden.
<b>Intended User</b>	LCA practitioner
<b>General Purpose</b>	Excerpt from the report, see 'Publication': "The aim of the study is to undertake an LCA of typical water and sewage pumps. Those aspects which have a major contribution to the environmental impact in the life cycle of a pump will be identified."
<b>Detailed Purpose</b>	Limestone is needed to produce sinter which is the input for pig iron production. Pig iron is then processed into cast iron which is a main material in a water pump (90%).

Technical System	
<b>Name</b>	Linoleum flooring. ESA-DBP
<b>Functional Unit</b>	1 m2*year flooring
<b>Functional Unit Explanation</b>	<p>Excerpt from the publication (see 'Publication'):</p> <p>"The purpose of the study was to assess and compare the environmental impact from cradle to grave for floor coverings. The covering of one square metre of flooring during one year of operation was therefore chosen as the functional unit, or basis of comparison."</p> <p>1 m2 of linoleum floor weighs 2.556 kg, including laying waste.</p>
<b>Process Type</b>	Cradle to grave
<b>Site</b>	Not applicable
<b>Sector</b>	Construction
<b>Owner</b>	Not applicable
<b>Technical system description</b>	<p>Excerpt from the publication:</p> <p>"The life cycle of linoleum.</p> <p>Linseed oil, which is the most important raw material in the actual linoleum paste, acts as a binder. The oil is catalytically oxidised and polymerised with air in large tanks. This produces linoxyn, a reddish-brown highly elastic mass. The linoxyn is then mixed with resin from coniferous trees, known as colophonium. The mixed linoxyn and resin form a cement, which is left to mature. The cement is then mixed with powdered cork, powdered wood, powdered limestone and pigment. Powdered wood and cork are used to give the sheeting resilience, and powdered limestone is used as a mineral filler. In linoleum, titanium dioxide is used as the main pigment.</p> <p>After the mixing process, a homogeneous linoleum mass is obtained, which is then converted into granules. The granules are fused to backing, made from jute, under pressure and heat.</p> <p>The still soft sheeting is hung up in long loops in drying rooms to mature further, and is left there for two to three weeks.</p> <p>As the last stage of manufacture the sheets are coated with a thin layer of acrylate. After this has been done, the sheeting is trimmed and rolled. and after packaging it is ready for sale.</p> <p>The production chain takes four to six weeks."</p> <p>The flow chart for linoleum flooring can be found at page 247 in the publication.</p> <p>This system is described in: Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255.</p> <p>Link to pdf: <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf</a></p> <p>Other processes in the CPM Database also included in the above publication: Vinyl flooring. ESA-DBP Solid wood flooring. ESA-DBP</p> <p>Other processes in the CPM Database connected to the above publication: Diethyl phthalate (DOP) production. ESA-DBP</p>

System Boundaries	
<b>Nature Boundary</b>	Not applicable.
<b>Time Boundary</b>	Data are applicable to the situation at the time, i.e. 1994.
<b>Geographical Boundary</b>	<p>The scenarios describe a Swedish situation.</p> <p>The linoleum studied was produced in the Netherlands.</p>

<b>Other Boundaries</b>	Excerpts from the publication (see 'Publication'): - Floorings for domestic use were studied. - It was assumed for the calculations that there is no recycling or recovery of the flooring materials, and that all materials are incinerated, with energy recovery, after use. - It was assumed that all pigments used consisted of titanium dioxide. - Some additives in the products were used in such small quantities that their environmental impact was disregarded in the study.
<b>Allocations</b>	Excerpt from the publication (see 'Publication'): "The environmental impact of multi-output processes was allocated in proportion to the physical parameter most closely reflecting the economic value, which in most cases resulted in weight being used. No allocation was made between the two functions of incineration, waste elimination and heat production. Instead, the heat produced was reported as a useful energy flow leaving the systems analysed."
<b>Systems Expansions</b>	Not applicable.

About Inventory	
<b>Publication</b>	<p>Jönsson et al, 1997, Life cycle assessment of flooring materials: case study. Building and Environment, Vol. 32, No. 3, pp. 245-255.</p> <p>Link to pdf:  <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/Joensson_et_al_1997.pdf</a> </p>
<b>Intended User</b>	LCA practitioners.
<b>General Purpose</b>	<p>Excerpts from the publication (see 'Publication'):</p> <p>"The consequences of the human impact on the environment have become increasingly clear in recent years. A number of previously unknown environmental problems have emerged at local, regional and global levels, in spite of considerable efforts to decrease environmental emissions from identified point sources. Consequently, demands are now being made on the environmental soundness of products. From industry there is a demand for methods of improving products from the environmental point of view, both for internal use and for marketing purposes. Authorities need methods which can be used to assess the environmental consequences of product related decisions. Life cycle assessment (LCA) is becoming an increasingly important method for making product related environmental assessments."</p> <p>"When applying LCA to building materials and components, special methodological problems arise because of the relatively long lifetime and the complex purpose of these products. Therefore, a project entitled "Environmental Assessment of Buildings and Building Materials" has been initiated at the Department of Technical Environmental Planning of Chalmers University of Technology (CTH). The case study of flooring materials presented in this article constitutes the first step in this project."</p>
<b>Detailed Purpose</b>	<p>Excerpt from the publication (see 'Publication'):</p> <p>"The environmental impact of three flooring materials during their life cycles was assessed and compared using the LCA method. The objective was to make a specific comparison between the environmental impacts of the life cycle of some flooring materials and to develop a methodology for LCA of building materials."</p>

<b>Reviewer</b>	Tillman, Anne-Marie - Environmental Systems Analysis
<b>Applicability</b>	For applicability for the process see 'Technical System' and 'System Boundaries'.

<b>About Data</b>	<p>Excerpts from the publication (see 'Publication'):</p> <p>" - The three studied products all have a calorific value and could alternatively be used as fuels. Since the energy recovered from incineration was accounted for as an energy gain, the calorific value of the materials was treated as an energy cost.</p> <p>- Production of electricity was not included in the systems analysed, due to lack of data. Electricity use was thus accounted for only as the amount used. When interpreting the results, the amount of electricity used reflects a number of environmental impacts, including flooded land from hydropower, radioactive waste from nuclear power and emissions to the air from fossil fuel based electricity production.</p> <p>- The environmental impact of cleaning and maintenance was omitted. It was roughly assumed that the cleaning habits are probably independent of what floor covering is used. In addition, no reliable data were available in this area."</p> <p>ESA Database Project. ## SPINE LCI dataset: Liquid crystal display unit assembly

<b>Administrative</b>	
<b>Finished</b>	Y
<b>Date Completed</b>	2000-03-01
<b>Copyright</b>	Ericsson
<b>Availability</b>	Official

<b>Technical System</b>	
<b>Name</b>	Liquid crystal display unit assembly
<b>Functional Unit</b>	One gram liquid crystal display unit
<b>Functional Unit Explanation</b>	<p>The motivation for choosing this functional unit is:</p> <ul style="list-style-type: none"> <li>· suitable unit to work with in an LCA of a private branch exchange (a complicated telecom product)</li> <li>· important component of the MD110 product system and many other electronic products.</li> </ul> <p>DESIGN</p> <p>Both answers from component manufacturer one (CM1) and component manufacturer two (CM2) are for exactly the same component.  These facts are based on Ericsson technical specification of the component.</p> <p>Ericsson product number: RNH 921 409/1  Ericsson description of the display unit: Liquid Crystal Display Module</p> <p>General</p> <p>Display: 40 characters x 3 lines Liquid Crystal Display module  Character font: 5x8 dot matrix  Technology: FSTN (Film SuperTwisted Nematic)  Mode: positive, operates in reflective mode  Viewing angle 6 O'clock viewing angle direction  Duty cycle: 1:32  Bias: 1:6.7  Interface: 4-bit MPU interface  Antiglare: yes  Flat cable: yes</p>

	<p>DESIGN</p> <p>RNH 921 409/1 is a display module completed with larger line distance, with driving circuits which are mounted on its PC board. The display module is provided with a flat cable.</p> <p>Height: 38,8 mm Width: 164,4 mm Length: 9,5 mm Weight: 72 gram per display according to Ericsson</p> <p>Weight CM1: 76,2 g (106,2 g including packaging material) Weight CM1: 56,9 g</p>
<b>Process Type</b>	Gate to gate
<b>Site</b>	Not relevant
<b>Sector</b>	Manufacturing
<b>Owner</b>	Not relevant
<b>Technical system description</b>	<p>This activity includes the final assembly of a liquid crystal display unit. The activity is an average based on information acquired from two manufacturers. The description of the process is supplied by manufacturer one, but is assumed to be general for this type of manufacture. The following process steps are included;</p> <ol style="list-style-type: none"> <li>1. Mother glass patterning</li> <li>2. Off-set printing:</li> <li>3. Rubbing</li> <li>4. Common &amp; seal printing</li> <li>5. Mother glass assembly</li> <li>6. Scribing &amp; breaking</li> <li>7. Liquid crystal injection</li> <li>8. End seal</li> <li>9. Cell inspection</li> <li>10. Polarizer cut &amp; attachment</li> <li>11. LCD inspection</li> <li>12. Module assembly with PCB</li> <li>13. Inspection &amp; packing</li> <li>14. QA shipment inspection</li> <li>15. Consignment</li> </ol> <p>Details given:</p> <ol style="list-style-type: none"> <li>1. Mother glass patterning: The patterning of the mother glass is done through a mask that reproduce the drawing of circuit.</li> <li>2. Off-set printing: The alignment layer is printed over the mother glass</li> <li>3. Rubbing: The system uses an high speed rotary roll.</li> <li>4. Common &amp; seal printing: By a screen printing process the common &amp; seal agent are coated.</li> <li>5. Mother glass assembly: Front &amp; rear glasses are aligned to dedicated mark patterns.</li> <li>6. Scribing &amp; breaking: Glass is scribed along separation lines by small roll cutter and broken apart along the scribed lines.</li> <li>7. Liquid crystal injection: Every cell is filled with liquid crystal (LC) in a vacuum chamber.</li> <li>8. End seal: The filling hole is covered by an agent.</li> <li>9. Cell inspection: Appearance &amp; functional tests are carried out.</li> <li>10. Polarizer cut &amp; attachment: Front &amp; rear polarizers are cut and attached to the cell.</li> <li>11. LCD inspection: Appearance &amp; functional tests are carried out.</li> <li>12. Module assembly with PCB: LCD is assembled with frame, PCB and rubber connectors.</li> <li>13. Inspection &amp; packing: Products are inserted in plastic bags and included in inner boxes.</li> <li>14. QA shipment inspection: Further tests are carried out.</li> <li>15. Consignment: Products are packed inside master carton and shipped accordingly.</li> </ol> <p>Manufacturer two did not give any information about process steps.</p> <p>Additional information from manufacturer one (CM1):</p> <p>The annual production of liquid crystal display units is 180 000 pieces. A module is composed by the glass display and the electronic driving board assembled with a metal frame. More than 70% of the organic thinners (acetone and other ketones and alcohols) are</p>

	<p>recovered at the liquid state and wasted by an authorized service supplier.</p> <p>The recovery inside the factory is included by this supplier in the activity.</p> <p>The process water containing acid, salt and hydroxides are treated in a specific facility before sent into a river. The wastewater treatment are not included in the activity. There are two energy sources involved.</p> <p>The electric energy is used to run the machines and for the process ovens.</p> <p>The natural gas is used for the air conditioning and heating system.</p> <p>The concentration of the organic solvent in the air exhaust is periodically checked in the pipes by the Government Control Service.</p> <p>The quality of the wastewater is periodically checked the Government Control Service.</p>
--	--

System Boundaries	
<b>Nature Boundary</b>	<p>The emissions to air have nature as recipient. Each parameter mentioned by the component manufacturers has been studied. No parameter has deliberately been disregarded when environmental impact has been studied. Included component manufacturers have not specified the same parameters. In the cases where only one manufacturer has stated a parameter this has been used.</p> <p>Emissions to water are stated before the wastewater treatment facility.</p>
<b>Time Boundary</b>	<p>1998</p> <p>The answer from the manufacturer arrived in 1998 and they measured in 1998. The process technology used is most certainly the best available as the factories are located in Italy and Japan and the companies are well established.</p>
<b>Geographical Boundary</b>	<p>The technical system for this model is limited to the factory where the production takes place.</p> <p>The manufacturers included in the average are located in Italy and Japan.</p>
<b>Other Boundaries</b>	<p>Delimitations to the system is the final step in the making of the display unit. The production of the subparts (e.g. polarizer film, gold plated board, and liquid crystal) of the display unit is not included in this model. The transportation of them to the factory is not included. For interested parties who wish to include the transport figures given from the manufacturers, can find the figures in the section Applicability.</p> <p>For component manufacturer one, the packaging materials for the incoming raw material have been included.</p>
<b>Allocations</b>	<p>The manufacturers have not described how the allocation has been made.</p> <p>We did not decide or have any suggestions on how the manufacturer should allocate in their factory.</p>
<b>Systems Expansions</b>	None.

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1998
<b>Data Type</b>	Derived, unspecified
<b>Represents</b>	See 'Function'.
<b>Method</b>	<p>The data that are presented are calculated as a average based on information from two component manufacturers. The information from the manufacturers was acquired using a LCI data questionnaire. The average for each presented flow is calculated as follows: - First the amount of each flow per functional unit is calculated for each component manufacturer - Then the calculated amount for each component manufacturer is summed for each unique flow and divided by the number of included component manufacturers. In the information supplied by the manufacturer, they had indicated whether the data for each flow were measured, estimated or calculated. Below is a detailed account of the calculation procedure. Definition of variables: CMn: Component manufacturer number n. Myn: Materials, emission, waste, energy (y) given in component answer n. ACyn: Amount of material y in component, expressed in mg (or similar) by component manufacturer n. Wn: Weight of one piece of component, expressed in mg (or similar) by component manufacturer n. Nyn: The flow y expressed per functional unit from manufacturer n. Step 1: For CM1 sum <math>AC1 + \dots + ACn</math> Step 2: The sum <math>AC1 + \dots + ACn = W1</math> Step 3: Divide all flows between <math>M11 \dots M1n</math> by <math>W1 \rightarrow N11 \dots N1n</math> Step 4: Repeat Step 1 to 3 for all component manufacturers and for each flow. Step 5: Sum <math>N1n + \dots Nyn</math> and divide by the number of terms for each unique flow. (material input, emission etc.) An average calculation like above of up to two answers was made.</p>

Value used in this LCI model: $(8,944602779606 + 31,58581866932) / 2 = 20,26521072447 \text{ Wh/g}$ display unit. The used value is $20,265 \text{ Wh/g}$ display unit. This is an average value and the figure is based on two answers.	Input	Refined resource	Electricity	20.26521			Wh	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: $0,02 \text{ g} / 106,2093 \text{ g} = 0,000188 \text{ g/g}$ (Epoxy sealant) CM2: $9,7 \text{ mg} / 56987,6 \text{ mg} = 0,00017 \text{ g/g}$ (Sealing material) $(\text{CM1} + \text{CM2}) / 2 =$	Input	Refined resource	Epoxy	0.00018			g	Technosphere	

0,00018 g/g This is an average value and the figure is based on two answers.									
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 130 mg from one manufacturer. $0,13 \text{ g} / 106,2093 \text{ g} = 1,224\text{e-}3 \text{ g/g}$ display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based on one answer. Notes: 64-17-5 is the CAS number for Ethyl alcohol	Input	Refined resource	Ethyl Alcohol	0.001224			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 5,5 g from one manufacturer. $5,5 \text{ g} / 106,2093 \text{ g} = 5,178\text{e-}2 \text{ g/g}$ display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer. Notes: 7705-08-0 is the CAS number for ferric chloride	Input	Refined resource	ferric chloride	0.0000517			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: $60 \text{ g} / 106,2093 \text{ g} = 0,565 \text{ g/g}$ CM2: $11657 \text{ mg} / 56987,6 \text{ mg} = 0,205 \text{ g/g}$ $(\text{CM1} + \text{CM2}) / 2 = 0,385 \text{ g/g}$ This is an average value and the figure is based on two answers.	Input	Refined resource	Glass	0.269			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: $0,003 \text{ g} / 106,2093 \text{ g} = 0,000282 \text{ g/g}$ This is not an average value and the figure is based only on one answer.	Input	Refined resource	Glass fibre	0.0000282			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: $22 \text{ g} / 106,2093 \text{ g} = 0,207 \text{ g/g}$ CM2: $18920 \text{ mg} / 56987,6 \text{ mg} = 0,332 \text{ g/g}$ (given as PCB, printed circuit board) $(\text{CM1} + \text{CM2}) / 2 = 0,269 \text{ g/g}$ This is an average value and the figure is based on two answers.	Input	Refined resource	Gold plated board	0.269			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 5,5 g from one manufacturer. $5,5 \text{ g} / 106,2093 \text{ g} = 5,178\text{e-}2 \text{ g/g}$ display unit. 106,2093 g is the weight of one display unit according to this manufacturer. Estimated 1,7 mg from one manufacturer. $0,0017 \text{ g} / 56,9876 \text{ g} = 2,983105096547\text{e-}5 \text{ g/g}$ display unit. 56,9876 is the weight of one display unit according to this manufacturer. Average value: $(5,178\text{e-}2 + 2,983\text{e-}5) / 2 = 0,025864915 \text{ g/g}$ display unit. This is an average value and the figure is based on two answers.	Input	Refined resource	Hydrochloric acid	0.025864			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 10 g from one manufacturer. $10 \text{ g} / 106,2093 \text{ g} = 0,09415 \text{ g/g}$ display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.	Input	Refined resource	Isopropanol	0.139			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Calculated and estimated 40 ml from CM2. $40 \text{ cm}^3 * 0,89 \text{ g/cm}^3 / 56,9876 / 1000 = 6,247\text{e-}4 \text{ g/g}$ display unit. $6,247\text{e-}4 \text{ g} * 45 \text{ MJ/kg} = 0,0281115 \text{ MJ/g}$ display	Input	Refined resource	Kerosene	0.0281115			MJ	Technosphere	

unit. 56,9876 g is the weight of one display unit according to this manufacturer. 0,89 kg/m <sup>3</sup> is the density of kerosene at NTP according to formelsamlingen page 71. Brohammer page 116, HHV oil: 45 MJ/kg This is not an average value and the figure is based only on one answer.								
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: 0,03 g / 106,2093 g = 0.000282 g/g CM2: 250 mg/56987,6 mg = 0,00439 g/g (Stated as resistor, condenser + Flat cable) (CM1+CM2)/2 = 0,002336 g/g This is an average value and the figure is based on two answers.	Input	Refined resource	Liquid crystal polymer (LCP)	0.002336			g	Technosphere
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 40 mg from one manufacturer. 0,04 g / 106,2093 g = 3,766e-4 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.	Input	Refined resource	Methyl isobutyl ketone	0.0003766			g	Technosphere
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 18,8 dm <sup>3</sup> from CM2. Density nitrogen (liquid) from Tabell- och formelsamlingen för gymnasieskolan (1988), ISBN 91-7548-544-3, page 71 = 1,25 kg/m <sup>3</sup> 18,8 e-3 m <sup>3</sup> * 1,25 kg/m <sup>3</sup> / 1000/56,9876 = 4,123704104051e-7 g N <sub>2</sub> /g display unit. 56,9876 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer. Notes: CM1: The data is related to the situation before the treatment water facility.</p>	Output	Emission	Hydrochloric acid	0.0517			g	Water	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Estimated 400 mg from one manufacturer. <math>0,4 \text{ g} / 106,2093 \text{ g} = 3,766\text{e-}3 \text{ g/g display unit}</math>. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.  Notes: i-Propanol is the same as Isopropanol</p>	Output	Emission	i-Propanol	0.003766			g	Air	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Estimated 15 mg from one manufacturer. <math>0,0055 \text{ g} / 106,2093 \text{ g} = 1,412\text{e-}4 \text{ g/g display unit}</math>. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.</p>	Output	Emission	Methyl isobutyl ketone	0.0001412			g	Air	

weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.									
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 26,4 g from one manufacturer. 26,4 g / 56,9876 g = 0,463 g/g display unit. 56,9876 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.	Output	Emission	N2	0.463			g	Air	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 1000 mg NaOH and KOH from one manufacturer. 0,5 * 1 g / 106,2093 g = 4,7e-3 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. Assumed 50 % KOH and 50 % NaOH This is not an average value and the figure is based only on one answer. Notes: CM1: The data is related to the situation before the treatment water facility.	Output	Emission	NaOH	0.0047			g	Water	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 190 mg from one manufacturer. 0,19 g / 106,2093 g = 1,788e-3 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.	Output	Emission	Photoresist	0.001789			g	Air	
Date conceived: 1998 Data type: Derived, unspecified Method: Estimated 1000 mg NaOH and KOH from one manufacturer. 0,5 * 1 g / 106,2093 g = 4,7e-3 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. Assumed 50 % KOH and 50 % NaOH This is not an average value and the figure is based only on one answer. Notes: 1310-58-3 is the CAS-number for KOH CM1: The data is related to the situation before the treatment water facility.	Output	Emission	Potassium hydroxide	0.0047			g	Water	
Date conceived: 1998 Data type: Derived, unspecified Method: 1 gram display unit output is the base for all figures in this model.	Output	Product	Display units	1			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: Own calculation: Acetone input - Acetone in product output - Acetone as emissions = Acetone waste output = 0,00433 - 0 - 0,001883 = 0,002447 g/g display unit This is not an average value and the figure is based only on one answer.	Output	Residue	Acetone	0.002447			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM2: 7.42 mg/56987,6 mg = 0,00013 g/g This is not an average value and the figure is based only on one answer.	Output	Residue	Epoxy	0.00013			g	Technosphere	
Date conceived: 1998 Data type: Derived, unspecified Method: CM1: 30 g /106,2093 g = 0,282 g/g (Recycled to 100 %) CM2: 583 mg/56987,6 mg = 0,01 g/g (Recycled 2950 mg) (CM1+CM2)/2 = 0,146 g/g This is an average value and the figure is based on two answers.	Output	Residue	Glass	0.146			g	Technosphere	

<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Own calculation: Isopropanol input - Isopropanol product output - Isopropanol as emissions = Isopropanol waste output = 0,139 - 0 -0,003766 = 0,135234 g/g display unit This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Isopropanol	0.135234			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: CM2: 199,6 mg/56987,6 mg = 0,0035 g/g This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Liquid crystal polymer (LCP)	0.0035			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Own calculation: Methyl isobutyl ketone input - Methyl isobutyl ketone in product output - Methyl isobutyl ketone as emissions = Methyl isobutyl ketone as waste output = 0,0003766 - 0 -0,0001412 = 0,0002354 g/g display unit This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Methyl isobutyl ketone	0.0002354			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Own calculation: Paper input - Paper in product output - Paper as emissions = Paper waste output = 0,0424 - 0 -0 = 0,0424 g/g display unit This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Paper	0.0424			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: CM2: 1803 mg/56987,6 mg = 0,032 g/g This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Polarizer film	0.032			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: This flow is by one of the manufacturers called "water treatment mud". I called it Sludge. Estimated 20000 mg from one manufacturer. 20 g / 106,2093 g = 0,1883074269391 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Sludge	0.1883			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Calculated and estimated from one manufacturer. (2,780 - 2,140)/56,9876 = 0,01123051330465 g Solder cream/g display unit. 56,9876 g is the weight of one display unit according to this manufacturer. 2140 mg is the amount solder paste in product output. 2780 mg is the amount solder paste in raw material input. I assume the rest is waste output. This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Solder cream	0.0112			g	Technosphere	
<p>Date conceived: 1998  Data type: Derived, unspecified  Method: Estimated 20000 mg from one manufacturer. 20 g / 106,2093 g = 0,1883074269391 g/g display unit. 106,2093 g is the weight of one display unit according to this manufacturer. Used value: 0,1883 g/g display unit. This is not an average value and the figure is based only on one answer.</p>	Output	Residue	Waste water treatment chemicals	0.1883			g	Technosphere	

## About Inventory

<b>Publication</b>	<p>Not available.</p> <p>-----</p> <p>Data documented by: Anders Andrae, Ericsson Business Networks AB</p> <p>Documentation reviewed by: Ann-Christin Pålsson, CPM, Chalmers University of Technology</p> <p>-----</p>
<b>Intended User</b>	The intended use for this LCI
<b>General Purpose</b>	<p>The general purpose with this LCI model was for application in a LCA project at Ericsson Business Networks.</p> <p>The main goal of the study is; to compare the potential environmental impacts associated with an old (BC 8) and a new model (BC 10) of a private branch exchange (PBX) system, namely the MD110 system, and an additional objective is to include comparisons between different stages of the life cycle (e.g. manufacturing, use and end of life) of the system.</p> <p>The system, PBX MD110, is designed, developed and delivered by Ericsson Enterprise Systems AB.</p> <p>Life-Cycle Assessment methodology (following the ISO14040 standards for LCAs) will be used to determine the environmental impacts.</p> <p>The main purpose of the study for Ericsson is; - to learn, test and evaluate the LCA-methodology as a tool for assessing environmental improvement options in the product design process, and to make up concrete product guidelines regarding design for environment (DfE) and - to evaluate environmental aspects in new design. The relative importance for different life cycle stages may also be an important input in the internal work with an Environmental Management System for Ericsson Enterprise Systems.</p> <p>Another purpose of the study is; to collect and qualify data from suppliers and literature in order to build up a database for this and future LCA activities and within the project, it is also intended to analyse the possibilities to use the study as a base for future work regarding a type III ecolabeling project within Ericsson.</p> <p>The intended audience of the report from the project is; Ericsson's personnel: project management, system management, design, marketing and sales organisation, and thus also (in an extracted version) the Ericsson customers.</p>
<b>Detailed Purpose</b>	<p>Map a display unit manufacturing/assembly process from an environmental standpoint in a structured procedure. The purpose of the project was to collect resource consumption data and emission data connected with the final assembly of display units and resembling components in our telecom products.</p> <p>The usage for this set of data are life cycle assessments where display units are part of the studied system.</p> <p>Note: This model is one of in total eighteen models compiled at Ericsson, describing 16 component groups in the PBX.</p> <p>The division into component groups is based on structural resemblance, electrical function and material contents of the different components.</p> <p>-----</p> <p>Below is a list of the component groups and corresponding models that have been compiled:</p> <ol style="list-style-type: none"> <li>1. Cables - Model: Cable assembly</li> <li>2. Capacitors and filters; hole mounted devices - Model: Capacitor for hole mounting assembly</li> <li>3. Capacitors; surface mounted devices - Model: Capacitor for surface mounting assembly</li> <li>4. Connectors and holders - Model: Connector assembly</li> <li>5. Diodes - Model: Diode wafer production and assembly</li> <li>6. Display units and indicators - Model: Liquid crystal display assembly</li> <li>7. Microcircuits, oscillators, quartz crystal units and delay lines (2 models) - Models: 1. Integrated circuit capsule assembly and 2. Si wafer production and Si wafer processing for integrated circuits (these models are interlinked)</li> <li>8. Other - Model: "Other" electronic component assembly</li> <li>9. Potentiometers - Model: Potentiometer assembly</li> <li>10. Printed boards - Model: Printed board assembly</li> </ol>

	<p>11. Relays - Model: Relay assembly</p> <p>12. Resistor networks - Model: Resistor network assembly</p> <p>13. Resistors, varistors and thermistors; hole mounted devices - Model: Resistor for hole mounting assembly</p> <p>14. <b>Reviewer</b>	Pålsson, Ann-Christin - CPM Chalmers University of Technology S-412 96 Göteborg Sweden
<b>Applicability</b>	<p>This set of data can be applied to display units in electronic equipment if you know how much the display units weigh. The model is also intended to be representative for indicators in electronic equipment.</p> <p>-- Transports.--</p> <p>Here follows a more detailed description of transports of materials and components to the respective manufacturer factories. These transports are not included in the model.</p> <p>The calculation for all modes of transport is done like this: First the total transportation work per functional unit is calculated for each included component manufacturer. Then the total transportation is summed and divided by the number of included component manufacturers. This gives the average value for transportation by each mode of transport.</p> <p>-- Truck transportation: --</p> <p>Component manufacturer one (CM1):</p> <p>Glass with weight 30 g is transported 250 km, i.e. 30 g*250 km, Polaricer film 2 g * 250 km, Gold plated board 18 g * 30 km, Stainless steel 14,2 g * 30 km, Silicone rubber 2,2 g * 250 km, El. components 5,5 g * 300 km, PE anti static Bag 3,5 g * 50 km, Carton pack 30 g * 50 km,</p> <p>that is 12841 gkm.</p> <p>Weight of component: 106.2093 g</p> <p>The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:</p> $12841 \text{ gkm} / 106.2093 \text{ g} = 120.90 \text{ gkm/g}$ <p>Component manufacturer two (CM2):</p> <p>Weight of component: 56.9876 g</p> <p>Glass with weight 11.657 g is transported 400 km by road i.e. 11.657 g*400 km, Liquid crystal 0.25 g*850 km, Polarizers 2.868 g*600 km, Sealing material 0.0097 g*950 km, Coating materials 0.0007 g*450 km, PCB 18.92 g*350 km, LCD driver 4.02 g*800 km, Metal holder 19.05 g*800 km, Zebra rubber connector 3.36 g*600 km, Flat cable 2.8 g*800 km, Resistor, capacitor 0.07 g*800 km and Solder paste 2.78 g*480 km</p> <p>The total transportation work is calculated as follows: the weight of the materials and components multiplied by distance divided by the weight of the component. This gives:</p> $35781.31 \text{ gkm} / 56.9876 \text{ g} = 627.88 \text{ gkm/g}$ <p>This gives the average total transportation work by truck for CM1 and CM2:</p> $(CM1+CM2)/2 = 374.39 \text{ gkm/g}$ <p>--Airplane transportation: --</p> <p>Calculations manufacturer one:</p> <p>2 grams of polarizer transported 10000 km to the factory 2,2 grams of silicon rubber 10000 km to the factory 5,5 grams of electronic components 10000 km to the factory</p> <p>that is 97000 gkm. <math>97000 \text{ gkm} / 106,2093 \text{ g} = 913,29 \text{ gkm / g display unit}</math></p>

	<p>-- Boat transportation: --</p> <p>Calculations manufacturer one:  Transport by boat:  30 grams of glass transported 18000 km to the factory  that is 54000 gkm. <math>54000 \text{ gkm} / 106,2093 \text{ g} = 508,43 \text{ gkm} / \text{g display unit}</math></p>
<p><b>About Data</b></p>	<p>The data is based on information from one Italian and one Japanese manufacturer. The information was gathered using a life cycle inventory questionnaire.</p> <p>All flows are not average values and where there were only one manufacturer stating a certain flow, this one was chosen in the model.</p> <p>Of the flows about little more than 79 % are not average values. The flows for Raw material input of Glass, Polarzer film, Photoresist, HCl, Gold plated board, Stainless steel, Electrical components, Liquid crystal polymer and Epoxy resin, Waste output of Glass and Energy input of Electricity are average values.</p> <p>In specific QMetaData for each flow, we have indicated specifically for each flow how many manufacturers have been included.</p> <p>The figures in the original answer from the manufacturers should all have a special tag telling if the value has been calculated, measured or estimated or a combination of two or three of them. Ericsson specifically told the manufacturers to do so.</p> <p>The result is that approximately 22 % of the flows used in all manufacturers answers were only calculated, 10 % were only estimated, 18 % were only measured and 37 % were first estimated and then calculated. 13 % were first measured and then calculated</p> <p>The outline of the LCI data questionnaire that were used in the inventory follows below. No limitations or specifications were set for which substances they had to account</p> <p>-- LCI data questionnaire --</p> <p>Transport description:  Material type, Used weight of Material (g)/functional unit, Transport by road of Material (km), Transport by boat of Material (km), Transport by rail of Material (km).</p> <p>We here only asked for flows exceeded 2% by weight of the material declaration of the component.  Additional information was also asked for and here some manufacturers mentioned they had aeroplane transport instead of some of the other transport modes.</p> <p>Process description.</p> <p>Description of the entire production at the plant/site and a technical description of the plant production.  Description of the production line of the studied product. Flow chart of process steps for production of the studied product. Technical description of the production line. A very short description of each unit operation.  Data quality. For every figure you give, give an account on how you gathered it. C = calculated, E = estimated, M = measured.  General LCA-related information on the production system (Allocation procedures, system boundaries, etc.).  Additional information. (e.g. planned changes in production rate)</p> <p>Material, components and natural resource input, etc. We told them to express data in amount per functional unit.</p> <p>Name of material, component or resource. Used amount(mg). Amount In Product(mg).  Additional information  Energy-ware input  Energy -ware source. Quantity/functional unit. Unit.  Energy-ware supplier, production site (address). Suppliers of transport (address). Additional information.</p> <p>Emissions.</p> <p>Emissions to air. Indicate whether emissions from energy use are included in the data.  Name of emission to air. Emission to air/functional unit (mg). Additional information.</p> <p>Emissions to water. Indicate if data describes emissions going to external purification plant or directly to recipient.  Name of emission to water. Emission to water/functional unit (mg). Additional information.</p> <p>Emissions to soil.</p>

	Name of emission to soil. Emission to soil/functional unit (mg). Additional information.  Waste. Name of waste. Waste/functional unit (mg). Recycled/functional unit (mg). Additional information.

## SPINE LCI dataset: Locomotive two-stroke engine

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	1996-04-01
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Locomotive two-stroke engine
<b>Functional Unit</b>	1 kWh
<b>Functional Unit Explanation</b>	1 kWh mechanical work done by the engine
<b>Process Type</b>	Unit operation
<b>Site</b>	Sweden
<b>Sector</b>	Machinery and equipment
<b>Owner</b>	Sweden
<b>Technical system description</b>	Operation of a locomotive two-stroke engine.

System Boundaries	
<b>Nature Boundary</b>	Regulated emissions to air are considered.
<b>Time Boundary</b>	The data represents existing engines in use in 1996
<b>Geographical Boundary</b>	The data is based on an engine in use in Sweden.
<b>Other Boundaries</b>	A standardised test cycle on the engine (ECE R49) was used.
<b>Allocations</b>	N/A
<b>Systems Expansions</b>	N/A

Flow Data	
General Activity QMetadata	
<b>Date Conceived</b>	1996-01-01
<b>Data Type</b>	Single sample
<b>Represents</b>	See 'Function'.
<b>Method</b>	The emissions were obtained by tests on one locomotive engine using the standardised test cycle ECE R49 (MTC 96:4). The fuel used in the tests was diesel environmental class 3. The tests give weighted emission index in g/kWh, where kWh refer to mechanical work done by the engine.
<b>Literature Reference</b>	Exhaust emissions from a two stroke locomotive engine, MTC rapport 96:4, Motortestcenter, Svensk Bilprovning, 1996
<b>Notes</b>	Not applicable.

Technical System	
<b>Name</b>	Maintenance of train bearings - train type 'Regina'. ESA-DBP
<b>Functional Unit</b>	2 axleboxes with bearings on a distance of 100 000km
<b>Functional Unit Explanation</b>	<p>Excerpt from the report, see 'Publication': "The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. The functional unit (fu) is here defined as 2 axleboxes with bearings, mounted on a wheel axle in use on its matched Electric Multiple Unit (EMU) during 100 000 km of transport.</p> <p>(...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year."</p>
<b>Process Type</b>	Gate to gate
<b>Site</b>	SKF Sverige AB 415 50 Göteborg
<b>Sector</b>	Land transport
<b>Owner</b>	SKF Sverige AB 415 50 Göteborg
<b>Technical system description</b>	<p>The study was done for a train 'Regina' which is manufactured by Adtranz, today Bombardier Transportation, since the year 2000. In this kind of train pre-lubricated, sealed Tapered Bearing Units, so-called TBUs are used. The Reginas are used on the Swedish West coast, in Mälardalen and in Bergslagen.</p> <p>Excerpt from the study, see 'Publication':</p> <p>"The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate.</p> <p>(...) The Regina TBU is named 1639605 C and contains the bearing BT2B 641157 CB. The axlebox has the number 432758.</p> <p>The maintenance interval is of great importance for the analysis of the total environmental impact from the use of train bearings. However, the real maintenance interval is difficult to estimate, as the wheel axles can be sent to refurbishment for various reasons, e.g. misuse, derailment, warm-running, reached recommended maintenance interval etc. There is no statistics on how often the bearings are sent to refurbishment just because of malfunction of the bearings themselves.</p> <p>(...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year. For the bearings in Regina (...) the recommended maintenance interval (...) is 1 000 000 km. (...) These figures are based on evaluations of many factors, like climate, speed, lubrication and wheel axle and bearing construction, and do not reflect the performance of the bearings alone.</p> <p>(...) For the maintenance process, there is a number of sub-processes called dismounting of wheel axle, detergent production, naphtha production, lubricating oil and grease production, local processes, and waste oil handling."</p> <p>This process is included in the system described in:  Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden.  Link to PDF:  <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf</a></p> <p>Other processes in the CPM Database also included in the above publication:</p> <ul style="list-style-type: none"> <li>- Operation on train bearings - train type 'X1'. ESA-DBP</li> <li>- Operation on train bearings - train type 'X10'. ESA-DBP</li> <li>- Operation on train bearings - train type 'Regina'. ESA-DBP</li> <li>- Maintenance of train bearings - train type 'X1'. ESA-DBP</li> <li>- Maintenance of train bearings - train type 'X10'. Technical System	
<b>Name</b>	Maintenance of train bearings - train type 'X1'. ESA-DBP
<b>Functional Unit</b>	2 axleboxes with bearings on a distance of 100 000km
<b>Functional Unit Explanation</b>	Excerpt from the report, see 'Publication': "The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate. The functional unit (fu) is here defined as 2 axleboxes with bearings, mounted on a wheel axle in use on its matched Electric Multiple Unit (EMU) during 100 000 km of transport. (...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year."
<b>Process Type</b>	Gate to gate
<b>Site</b>	SKF Sverige AB 415 50 Göteborg
<b>Sector</b>	Land transport
<b>Owner</b>	SKF Sverige AB 415 50 Göteborg

<b>Technical system description</b>	<p>The study was done for a train 'X1' which was manufactured by ASEA during the years 1967-1975. In this kind of train an un-sealed Spherical Roller Bearings (SRBs) were used. More than 100 of X1s were produced and most of them are still in use especially in Stockholm area.</p> <p>Excerpt from the study, see 'Publication':  "The function of bearings in train wheels is to be the link between wheel axle and train car, and make the axle able to rotate.</p> <p>(...) The SRB used in X1-A, X1-B and X10 has the SKF product number 23226 CC/C3W33, and the axleboxes are called 723724, 723721 and 4000850 respectively.</p> <p>The maintenance interval is of great importance for the analysis of the total environmental impact from the use of train bearings. However, the real maintenance interval is difficult to estimate, as the wheel axles can be sent to refurbishment for various reasons, e.g. misuse, derailment, warm-running, reached recommended maintenance interval etc. There is no statistics on how often the bearings are sent to refurbishment just because of malfunction of the bearings themselves.</p> <p>(...) For the calculations a maintenance interval of 500 000 km is assumed for the bearings, which implies maintenance every fifth year if the EMUs are run 100 000 km per year. For the bearings in X1 (...) the recommended maintenance interval (...) is 1 200 000 km. (...) These figures are based on evaluations of many factors, like climate, speed, lubrication and wheel axle and bearing construction, and do not reflect the performance of the bearings alone.</p> <p>(...) For the maintenance process, there is a number of sub-processes called dismounting of wheel axle, detergent production, naphtha production, lubricating oil and grease production, local processes, and waste oil handling."</p> <p>This process is included in the system described in:  Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden.  Link to PDF:  <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf</a></p> <p>Other processes in the CPM Database also included in the above publication:</p> <ul style="list-style-type: none"> <li>- Operation on train bearings - train type 'X1'. <b>About Inventory</b>	
<b>Publication</b>	Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003: 3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: <a href="http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf">http://cpmdatabase.cpm.chalmers.se/DataReferences/ESA_2003--3.pdf</a>
<b>Intended User</b>	LCA practitioner
<b>General Purpose</b>	Excerpt from the report, see 'Publication': "The goal of this LCA is to investigate the environmental impact of the use-phase for bearings in trains. Three generations of trains, so-called Electrical Multiple Units (EMUs), will be studied, and comparison will be made between processes within the life cycle of the bearings, and between the bearings in the different generations of EMUs."
<b>Detailed Purpose</b>	Maintenance of the bearings has a great importance in a use phase so it was necessary to investigate its impact.
<b>Commissioner</b>	SKF Sverige AB - 415 50 Göteborg .
<b>Practitioner</b>	Karl Jonasson - .
<b>Reviewer</b>	Björn Andersson, - Environmental Systems Analysis, Chalmers University of Technology
<b>Applicability</b>	For applicability for the process see 'Technical System' and 'System Boundaries' above
<b>About Data</b>	ESA database project. Years 2009-2011. Administrating organization: Chalmers University of Technology, Department of Environmental Systems Analysis. Financier: The Swedish Research Council (Vetenskapsrådet) Data documentor: Katarzyna Iwanek assisted by Filippa Fuhrman (ESA) and Johan Tivander (ESA). Review committee for imported data: Johan Tivander (ESA), Emma Rex (CPM, Center for environmental assessment of Product and Material Systems), Bengt Steen (ESA), Anne-Marie Tillman (ESA).
<b>Notes</b>	Excerpt from the report, see 'Publication': "SKF provides both bearings and bearing housings for trains, called axleboxes, which are mounted in direct connection with the train's wheels to make the wheel axle able to rotate (...). The bearings used for this purpose are in this study referred to as 'train bearings', even though there are other fields of application for bearings in trains (e.g. in the traction system). What type of rolling bearings used for the wheel axle varies according to performance needs and train design, but the function is essentially the same."

SPINE LCI dataset: Manufacturing of brass cages at SKF's site in Göteborg

Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	02-12-31
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Manufacturing of brass cages at SKF's site in Göteborg
<b>Functional Unit</b>	One brass cage, 55,6 kg
<b>Functional Unit Explanation</b>	<p>One SKF spherical roller bearing 232/530 consists of following components:</p> <ol style="list-style-type: none"> <li>1. one inner ring</li> <li>2. one outer ring</li> <li>3. one guide ring</li> <li>4. one brass cage</li> <li>5. 36 rollers (coated or non-coated)</li> </ol> <p>The functional unit for this process is one brass cage. Note that this is only a subactivity for "Production of brass cages used for spherical roller bearings". The total data in the activity "Production of brass cages used for spherical roller bearings" can finally be used (together with data for the other ingoing components) to calculate environmental impact for a complete SKF spherical roller bearing 232/530.</p> <p>Dimensions of the bearing:  <math>d_i = 530</math> mm  <math>d_y = 980</math> mm  breadth = 355 mm</p>
<b>Process Type</b>	Gate to gate
<b>Site</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Sector</b>	Materials and components
<b>Owner</b>	SKF Sverige AB415 50 GÖTEBORG
<b>Technical system description</b>	<p>This activity describes a process step included in the system "Production of brass cages used for spherical roller bearings", also available in the SPINE@CPM database.</p> <p>Turned brass cylinders are bought from BecoTek AS in Norway (see "Production of turned brass cylinders").</p> <p>At the SKF plant in Göteborg the brass cylinders are treated and processed in several steps to obtain the desired shape.</p> <ol style="list-style-type: none"> <li>1. First the cylinders are turned in the Morando lathe (66 minutes).</li> <li>2. The cylinders are then drilled. The drilling takes about 93 minutes and is the most time consuming step in the process.</li> <li>3. To get rid of sharp edges from the drilling, the cages are then ground by hand.</li> <li>4. The last step is to trumble the cages with trumble chips made of ceramic stones to get a smooth surface.</li> </ol> <p>The cages are then transported, by industrial trucks, to the C-factory at SKF where the final assembly takes place. (1 km electric truck transport is included)</p> <p>The trumbling chips are not included in this study, since the amount of chips needed for one cage was insignificant. Also the energy consumption for the trumbling of the cages was neglected since it is very small in comparison to the energy consumption of the other process equipment.</p> <p>The brass-scrap from the SKF process is transported to Västerås, Sweden, for complete recycling. This transport and recycling activity is NOT included in this dataset. The cutting fluid is transported to Halmstad for destruction and use as energy source in the Cement-industry. This transport and destruction activity is NOT included in this dataset. See the activity "Production of brass cages used for spherical roller bearings" for further information.</p>

System Boundaries	
<b>Nature Boundary</b>	<p>No emissions to air are included since they were not known and measured. The trumble chips are not followed from the cradle and not to the grave. The brass scrap that leaves the system is considered to be a co-product since it is used as raw material for new products and thus the boundary is the technosphere.</p> <p>The mineral oil in the cutting fluid has NOT been accounted for. The cutting fluid is an emulsion with water and 4% of CASTROL SW 3420. According to the product data sheet for CASTROL SW 3420 it consists of 40% mineral oil. Databases for "Extraction of crude oil" and "Refining of crude oil" from SPINE@CPM can be used for tracing the mineral oil to its</p>

	cradle. The activity "Combustion of waste oil" can be used for following the mineral oil to its grave. This is also a separate activity that can be found in SPINE@CPM database.
<b>Time Boundary</b>	The data is collected during autumn 2002. No changes in the procedure are planned for the nearest future.
<b>Geographical Boundary</b>	The manufacturing of cages takes place at SKF in Göteborg, Sweden.
<b>Other Boundaries</b>	In the activity "Manufacturing of brass cages at SKF's site in Göteborg" also internal transport within SKF industrial area 1 km electric truck is included and the electricity production needed for this (0,75 kWh/km) This assumption of energy consumption is made at BeTe Trucks AB in Sweden. The electricity production is NOT included. Swedish average electricity production should be used.
<b>Allocations</b>	For the process at SKF in Göteborg the data is production specific to the specific cage. For other cages with different dimensions the processing time in the different process equipment can vary, and thus also the energy consumption can vary.
<b>Systems Expansions</b>	Not applicable

## Flow Data

### General Activity QMetaData

<b>Date Conceived</b>	02-08-01 - 02-12-31
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	See 'Function'
<b>Method</b>	Most of the data is obtained from estimations from the production manager Christer Landgren. The finished brass cage is weighted to obtain the correct weight, 55,6 kg. Other data is described for each flow.
<b>Literature Reference</b>	Jonasson K., Environmental Aspects of the Use-Phase for Bearings in Trains. Environmental Systems Analysis, Report 2003:3, ISSN 1404-8167. Chalmers University of Technology. Gothenburg, Sweden. Link to PDF: <a href="http://www.cpm.chalmers.se/CPMDatabase/DataReferences/ESA_2003--3.pdf">http://www.cpm.chalmers.se/CPMDatabase/DataReferences/ESA_2003--3.pdf</a>
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

### Flow Table and Specific Meta Data

QMetaData	Direction	FlowType	Substance	Quantity	Min	Max	Unit	Environment	Geography
Date conceived: 02-08-01 - 02-12-31 Data type: Calculated Method: There is a tank with a volume of 11000 litres. This tank is changed 2 times every year. According to the plant manager, 70 cages are manufactured each day ==> 25550 cages/year. This means 0,86 litres / cage. The liquid consists of 4 % Castrol SW3420. This product consists of 40% mineral oil according to the product data sheet. The amount of mineral oil should be accounted for. (extraction and refining of crude oil) The amount of emulsion (880 l/year) must be followed to the grave.	Input	Refined resource	Cutting fluid	0.86			kg	Technosphere	Sweden
Date conceived: 02-08-01 - 02-12-31 Data type: Derived, mixed Method: For each process equipment the effect demand was measured. This effect number was multiplied with the time needed for one cage to be processed. The morando lathe = 66 min/ cage, 10,9 kW The XCB 1200-3 drilling machine = 93 min/cage, 12 kW The internal transport by electric truck is also included: 1 km. Electric truck: 0,75 kWh/km (assumptions made by BeTe Truck AB in Sweden) ==> $(66/60)*10,9 + (93/60)*12 + 0,75 = 31,35$ kWh/cage	Input	Refined resource	Electricity	31.35			kWh	Technosphere	Sweden
	Input	Refined resource	Turned brass cylinders	205			kg	Technosphere	Norway
	Output	Co-product	Scrap	149.4			kg	Technosphere	Sweden
	Output	Product	Brass cage	55.6			kg	Technosphere	Sweden

	Output	Residue	Cutting fluid	0.86		kg	Technosphere	Sweden

## About Inventory

<b>Publication</b>	Master thesis: LCA based solution selection. Helene Berg and Sandra Häggström, Chalmers University of Technology, December 2002. ----- Data documented by Helene Berg, M Sc. student at Chalmers University of Technology and SKF. Documentation reviewed by Karolina Flemström, Industrial Environmental Informatics, Chalmers University of Technology. Published in SPINE@CPM 2003-02-18.
<b>Intended User</b>	Product developers at SKF.
<b>General Purpose</b>	The data documentation is accomplished as a part of the thesis work "LCA-based solution selection", performed at Chalmers University of Technology by Helene Berg and Sandra Häggström.
<b>Detailed Purpose</b>	The detailed purpose for our study is to compare a coated spherical roller bearing (232/530) to a non-coated, from cradle to grave. We have chosen paper machines as user phase. The bearing is mounted on a soft calender roll in both cases.
<b>Commissioner</b>	Victoria Wikström - SKF Sverige AB D1S3 415 50 Göteborg .
<b>Practitioner</b>	Helene Berg - .
<b>Reviewer</b>	Olle Ramnäs -
<b>Applicability</b>	The data is valid for production of brass cages of this dimension at the specific site at SKF in Göteborg, Sweden.
<b>About Data</b>	Data is gathered from measurements in the cage factory and from interviews with Christer Landgren, SKF Sverige AB.
<b>Notes</b>

## SPINE LCI dataset: Manufacturing of CD-R (Compact Disc-Recordable). ESA-DBP

### Administrative

<b>Finished</b>	Y
<b>Date Completed</b>	1997
<b>Copyright</b>	Environmental Systems Analysis, Chalmers Univ. of Technology
<b>Availability</b>	Public

### Technical System

<b>Name</b>	Manufacturing of CD-R (Compact Disc-Recordable). ESA-DBP
<b>Functional Unit</b>	1 pce of CD-R
<b>Functional Unit Explanation</b>	1 compact disc-recordable.
<b>Process Type</b>	Gate to gate
<b>Site</b>	LOGOS, Göteborg, Sweden
<b>Sector</b>	Manufacturing
<b>Owner</b>	LOGOS, Göteborg, Sweden
<b>Technical system description</b>	Excerpt from the report, see 'Publication': "CD-R has got a recording layer of cyanide dye between the PC and the reflecting layer and the reflecting layer is made of gold (...). The cyanide dye is sensitive to ultraviolet light. The recording is done by ultraviolet laser which changes the layer to become absorbing instead of transparent. (...) - The manufacturing chain starts with preparing a glass disc with a photo resistant layer. The glass disc is then recorded with a laser. In the CD-R manufacturing only tracks for the laser beam are recorded. The following step is to develop and coat the surface with thin layer of metal.

	<p>- The next step is electroforming, where the developed disc is covered by nickel. The nickel part which is called the metal father and the glass disc are then separated. Once again electroforming is used to produce a negative nickel copy which is called the mother. The metal mother is made as a safety copy from which it is easy to make a second metal father which can be used as a stamper.</p> <p>- The stamper is put in a moulding machine where it is brought in contact with melted polycarbonate under high pressure, it conforms to the stampers contours, producing a substrate disc with pits or tracks.</p> <p>For the CD-R manufacturing an additional step of spin coating the surface of the disc with a very thin recording dye layer is carried out before the next step.</p> <p>- To the moulded disc the reflective layer is applied by magnetron sputtering, this layer usually consists of (...) gold.</p> <p>- To protect the thin and sensitive metal layer the disc is spin coated with an acrylic resin. Finally it is common to give the discs a label by screen printing with acrylic resin.</p> <p>The recording area of a CD, between the 46 mm inner and 117 mm outer radius, is 90.85cm<sup>2</sup>. This area have been used to calculate to amounts of material used in some of the stages.</p> <p>(...) The finished product is blank CD with no stored data, therefore a recording session will follow.</p> <p>(...) When the CD is finished it is put in Jewel box together with a booklet. The weight of a CD library will be less than 200g including transport packaging." (NB: excluded from the study)</p> <p>This process is included in the system described in: Beckman T. (1997). Gutenberg versus IT. A Life Cycle Assessment of printed and CD-stored information. Technical Environmental Planning, Report 1997:3, Chalmers University of Technology. Gothenburg, Sweden.</p> <p>Other processes in the CPM Database also included in the above publication:</p> <ul style="list-style-type: none"> <li>- Manufacturing of CD-ROM (Compact Disc - Read Only Memory). ESA-DBP</li> <li>- Dioctyl phthalate (DOP) production. ESA-DBP</li> <li>- Cultivation and felling of trees for papermaking. ESA-DBP</li> <li>- Cardboard production (MDF based). ESA-DBP</li> <li>- Production of copypaper. ESA-DBP</li> <li>- Production of orthoxylene. ESA-DBP</li> </ul>
--	---

System Boundaries	
<b>Nature Boundary</b>	The inventory analysis included parameters describing resource use (energy and raw materials). Polycarbonate will be reused.
<b>Time Boundary</b>	1996-1997
<b>Geographical Boundary</b>	Sweden
<b>Other Boundaries</b>	<p>The recording session requires a small amount of electricity but no data for this have been available and is therefore omitted in this study.</p> <p>(...) The transport packaging is not included in this study.</p> <p>The mastering of the father, stamper will not be included since the same stamper can be used to all discs why it can be considered as a part of the machine and the production of machines are not included in this study. From the manufacturing of one CD, 1.80g polycarbonate is wasted and sent to recycling. Of this recycled PC 40%, (weight), is coated with metal."</p>

About Inventory	
<b>Publication</b>	Beckman T. (1997). Gutenberg versus IT. A Life Cycle Assessment of printed and CD-stored information. Technical Environmental Planning, Report 1997:3, Chalmers University of Technology. Gothenburg, Sweden.
<b>Intended User</b>	LCA practitioner
<b>General Purpose</b>	The study was done for the purpose of master thesis.
<b>Detailed Purpose</b>	Excerpt from the report: "The goal of this study is to undertake an life cycle assessment (LCA) of different alternatives for Ericsson to provide their customers with reference libraries to the Ericsson Consolo MD110 telephone exchange system. The different documentation alternatives investigated in this study are: plastic ring binders, paperbacks, CD-R records and CD-ROM records."
<b>Commissioner</b>	Ericsson, Stockholm, Sweden - .

<b>Availability</b>	Public

Technical System	
<b>Name</b>	Manufacturing of Cold Rolled Steel Tubes, 41,55 x 37,21 or 47,75 x 41,01 mm
<b>Functional Unit</b>	1 ton Cold rolled steel tubes, 41,55 x 37,21 or 47,75 x 41,01 mm
<b>Functional Unit Explanation</b>	41,55 x 37,21 means that the outer diameter is 41,55 mm and the inner diameter 37,21 mm. It is the same for 47,75 x 41,01 mm.  The steel quality is SKF3 100Cr6.

<b>Process Type</b>	Gate to gate
<b>Site</b>	Cold Rolling Mill Ovako Steel AB 813 82 Hofors Sweden
<b>Sector</b>	Materials and components
<b>Owner</b>	Cold Rolling Mill Ovako Steel AB 813 82 Hofors Sweden
<b>Technical system description</b>	<p>The Colled rolled steel tubes of diameters 41,55 x 37,21 mm and 47,75 x 41,01 mm are manufactured from Hot rolled steel tubes of diameter 70,7 x 47,5 mm. The steel quality is SKF3 100Cr6. The tubes are purchased from the Hot rolling mill at the same manufacturing plant, Ovako Steel AB. The production of Hot rolled steel tubes is not included here, but are presented as a separate data set (see the activity about "Manufacturing of Hot Rolled Steel Tubes").</p> <p>Manufacturing processes included in this activity are:</p> <ol style="list-style-type: none"> <li>1. Cold rolling</li> <li>2. Surface treatment: <ol style="list-style-type: none"> <li>a. Grinding</li> <li>b. Peeling</li> </ol> </li> <li>3. Inspection (ultra sonic)</li> </ol> <p>The tubes are processed by cold rolling and then passed on for surface treatment. Depending on customer demand, the surface treatment is either grinding or peeling. The difference between grinding and peeling is mostly cosmetic. The grinding and peeling both result in about the same amount of steel scrap and the scrap is recycled in both cases. After surface treatment the tubes are controlled for cracks with ultra sound (inspection), cut and delivered.</p> <p>Cleaning of process water is not included in the system.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Emissions to air are not included due to lack of data. Emissions to water are considered and the recipient is Hoån, Sweden.
<b>Time Boundary</b>	The data is based on the production in 1998.
<b>Geographical Boundary</b>	The cold rolling mill is located in Hofors, Sweden.
<b>Other Boundaries</b>	<p>Production of refined resources is not included. Refined resources not included:</p> <ul style="list-style-type: none"> <li>- Hot rolled steel tube</li> <li>- District heating</li> <li>- Emulsion</li> <li>- Hydraulic oil</li> <li>- Steam</li> </ul> <p>Production of electricity is not included. Waste treatment is not included. Subsystems concerning employees are not included. Transports are not included. Maintenance of machinery is not included.</p>
<b>Allocations</b>	Allocations have been made according to weight. At the Ovako Steel Cold Rolling Mill, steel tubes can be produced by either cold rolling or cold drawing. Data that corresponds to cold drawing is excluded because the tubes in this activity are produced by cold rolling. The total amount of emissions and waste for production of all cold rolled steel tubes are divided by the total amount of produced tonnes of steel tubes. This gives the amount of emissions and waste that corresponds to the production of 1 ton cold rolled steel tubes.
<b>Systems Expansions</b>	Not relevant

## SPINE LCI dataset: Manufacturing of Hot Rolled Round Steel Billets, 80 mm

Administrative	
<b>Finished</b>	Y
<b>Date Completed</b>	2002-08
<b>Copyright</b>	
<b>Availability</b>	Public

Technical System	
<b>Name</b>	Manufacturing of Hot Rolled Round Steel Billets, 80 mm
<b>Functional Unit</b>	1 ton of Hot rolled round steel billets, 80 mm
<b>Functional Unit Explanation</b>	The steel quality of the round billets of diameter 80 mm is SKF3, 100Cr6.
<b>Process Type</b>	Gate to gate
<b>Site</b>	Rolling Mill Ovako Steel AB 813 82 Hofors Sweden
<b>Sector</b>	Materials and components
<b>Owner</b>	Rolling Mill Ovako Steel AB 813 82 Hofors Sweden
<b>Technical system description</b>	<p>The Hot rolled round steel billets are manufactured from Steel ingots, which are purchased from the Steel mill at Ovako Steel. The production of Steel ingots is not included here, but is presented as a separate data set (see the activity about "Production of bearing steel"). The steel quality is SKF3, 100Cr6.</p> <p>These process steps are included in the data set:</p> <ol style="list-style-type: none"> <li>1. Pit Furnace</li> <li>2. Billet rolling, stand 1</li> <li>3. Oxygen scarfing</li> <li>4. Billet rolling, stand 2</li> <li>5. Billet rolling, stand 3</li> <li>6. Partitioning (cutting)</li> <li>7. Cooling bed</li> <li>8. Shot blasting</li> <li>9. Surface treatment if needed after inspection (grinding)</li> </ol> <p>When the ingots are put in the pit furnace they have a temperature of about 800 degrees Celsius. Six of the furnaces have oxyfuel technology, six have oil/air combustion and one is heated with liquefied petroleum gas. In the furnace the ingots are heated up to rolling temperature which is about 1200 degrees. When the rolling temperature is reached the ingots are soaked for three hours.</p> <p>The ingots are rolled in 26 passes down to 220 square and are thereafter sent through the</p>

	<p>oxygen scarfing. Added in the oxygen scarfing process are LPG, oxygen, polymers and water. In rolling stand 2 the ingots are rolled down to 150 mm square billets and passed on to rolling stand 3. In rolling stand 3 the rolling of round billets of different diameters take place (80, 90 and 120 mm). These are the final dimensions and the billets are now cut (partitioning) and put on a cooling bed until the temperature is at a maximum of 100 degrees.</p> <p>After that the billets are sand blasted, inspected and surface defects, if any, are removed by grinding.</p> <p>The process steps 1- 4 are called Production line I and process steps 5- 9 are called Production line II.</p>
--	---

System Boundaries	
<b>Nature Boundary</b>	<p>Emissions to air are included.</p> <p>Emissions to water are not included due to lack of data.</p> <p>The recipient of waste water is Hoån.</p> <p>Residues to the technosphere are not further followed to the grave.</p> <p>Landfilled residues are deposited within Ovako Steel land property, but possible leakage to soil and ground water is not known.</p>
<b>Time Boundary</b>	The data is based on the production of steel billets in 1998.
<b>Geographical Boundary</b>	The Ovako Steel Rolling Mill is located in Hofors, Sweden.
<b>Other Boundaries</b>	<p>Production of refined resources is not included. Refined resources not included:</p> <ul style="list-style-type: none"> <li>- Steel ingot</li> <li>- Brick</li> <li>- Dolomite</li> <li>- Grease</li> <li>- Hydraulic oil</li> <li>- Light fuel oil</li> <li>- LPG</li> <li>- N2</li> <li>- O2</li> <li>- Polymers</li> </ul> <p>Production of electricity is not included.</p> <p>Transports are not included, except for internal transport with electrical industrial truck.</p> <p>Waste treatment is not included.</p> <p>Subsystems concerning employees are not included.</p> <p>Recycling of steel scrap is not included.</p>
<b>Allocations</b>	<p>Allocations have been made according to weight.</p> <p>Specification of weights of the flows for production of billets at the :</p> <ul style="list-style-type: none"> <li>- Total weight of steel ingots into Production line I; 410 427 tons</li> <li>- Total weight of billets out from Production line II; 156 575 tons</li> <li>- Total weight of billets for tubes out from Production line II; 106 761 tons</li> <li>- Total weight of billets out from Production line III; 183 225 tons</li> </ul> <p>For description of Production line I(process step 1-4) and II (process step 4-9) see Function. Production line III is the production of square billets and data for this flow is not included in this data set, except that the weight into Production line III has been taken in consideration in the allocations.</p> <p>Allocations:</p> <ul style="list-style-type: none"> <li>- The different steel billets produced at Ovako Steel are 80, 90, 120 mm round and 150 mm square.</li> <li>- The manufacturing process is the same until after rolling stand 2, where all billets are 150 mm square.</li> <li>- After that the billets go to partitioning (Production line III) or to further rolling procedures (Production line II).</li> <li>- The total output weight for Production line II and III is 339 000 tons. Therefor Production line II counts for 46,1% of Production line I.</li> <li>- For the input and output data in Production line II no difference has been made between the different dimensions of round billets. In other words it is assumed that the billets are processed equally regarding time, oil, etc.</li> <li>- Only the weight of the billets has been used as basis for allocation.</li> <li>- The total weight of round billets produced in Production line II where 156 575 tons. Therefor these tubes count for all of the input and output data specific for flow 2.</li> <li>- As an example these billets counts for 46,1 % of electricity consumption in Production line I and all of the electricity consumptin in Production line II.</li> </ul>

<b>General Activity QMetadata</b>

<b>Date Conceived</b>	1998-01-01 - 2000-02-28
<b>Data Type</b>	Derived, mixed
<b>Represents</b>	Ovako Steel AB in Hofors
<b>Method</b>	The data is based on productin data at the Rolling Mill at Ovako Steel AB in Hofors, Sweden. Emission data is all monitored by authorised companies, except for CO2 emissions that are derived from the carbon content in the combusted fuel.
<b>Literature Reference</b>	Internal information from Ovako Steel as recived from Lars-Gunnar Larsson at the rolling mill at Ovako Steel AB.
<b>Notes</b>	See "Represents" for each flow to see which power generation system that are used to generate the electricity.

Flow Table and Specific Meta Data										
<b>QMetaData</b>	<b>Direction</b>	<b>FlowType</b>	<b>Substance</b>	<b>Quantity</b>	<b>Min</b>	<b>Max</b>	<b>Unit</b>	<b>Environment</b>	<b>Geography</b>	
Data type: Monitored data, continuous Notes: Measured by B. Kvarnström, not specified how.	Input	Natural resource	Municipal water	0.14			m3	Ground	Sweden	
Data type: Unspecified, guesstimate Notes: The use of Surface water is estimated by Lars-Gunnar Larsson at the Rolling Mill at Ovako Steel AB in Hofors.	Input	Natural resource	Surface water	2.01			m3	River	Sweden	
Data type: Economical information Notes: Purchased weight.	Input	Refined resource	Brick	0.16			kg	Technosphere	Sweden	
Data type: Economical information Notes: Purchased weight	Input	Refined resource	Dolomite	0.029			kg	Technosphere	Sweden	
Data type: Monitored data, continuous Notes: Not specified by provider from Ovako Steel, Lars-Gunnar Larsson.	Input	Refined resource	Electricity	105			kWh	Technosphere	Sweden	
Data type: Economical information Notes: Purchased weight	Input	Refined resource	Grease	0.054			kg	Technosphere	Sweden	
Data type: Monitored data, discrete Notes: Measured by Per Hellberg, not specified how.	Input	Refined resource	Hydraulic oil	0.115			l	Technosphere	Sweden	
Data type: Monitored data, discrete Method: The consumption of Light fuel oil is measured to 17,96 kg for production of 1 ton Hot rolled round steel billets. The energy content of light fuel oil is 11,6 kWh/kg according to Physics Handbook. The energy content of 17,96 kg light fuel oil therefore is 208 kWh. Literature: Physics handbook, T-8.5, 1996 Notes: Measured by T. Klaussen, not specified how.	Input	Refined resource	Light fuel oil	208			kWh	Technosphere	Sweden	
Data type: Monitored data, discrete Method: The consumption of LPG is measured to 3,442 kg for production of 1 ton Hot rolled round steel billets. The energy content of LPG is 12,8 kWh/kg according to Physics Handbook. The energy content of 3,442 kg LPG therefore is 44,1 kWh. Literature: Physics handbook, T-8.5, 1996 Notes: Measured by T. Klaussen, not known how. LPG is Liquefied Petroleum Gas. The gas is a mixture of Propane (C3H8) and Butane (C4H10).	Input	Refined resource	LPG	44.1			kWh	Technosphere	Sweden	
Data type: Unspecified Notes: Provider of information T. Klaussen.	Input	Refined resource	N2	0.006			m3	Technosphere	Sweden	
Data type: Monitored data, discrete Notes: Measured by T. Klaussen, not known how. The Oxygen gas has a temperature of 15 degrees Celsius.	Input	Refined resource	O2	27.7			m3	Technosphere	Sweden	
Data type: Unspecified Notes: The data origin is not known, but provider of information is Stewen Persson at Ovako Steel. Chemical name: 2-propenic acid with 2-polyacrylamide	Input	Refined resource	Polymers	5.15			ml	Technosphere	Sweden	
Data type: Economical information Notes: Purchased from the Steel Mill. The temperature is about 800 degrees Celsius.	Input	Refined resource	Steel ingot	1.202			tonne	Technosphere	Sweden	

Data type: Derived, unspecified Notes: Data is calculated by H. Burtsoff at Ovako Steel, not known how.	Output	Emission	CO2	43.1		kg	Rural air	Sweden
Data type: Monitored data, discrete Notes: Measured by H. Burtsoff, not known how.	Output	Emission	Dust	25.3		mg	Rural air	Sweden
Data type: Estimated from similarity Notes: Estimated from similarity by H. Burtsoff, not known how.	Output	Emission	NOx	177		g	Rural air	Sweden
Data type: Derived, unspecified Notes: Data is calculated by H. Burtsoff at Ovako Steel, not known how.	Output	Emission	SO2	53		g	Rural air	Sweden
Data type: Unspecified, guesstimate Notes: The output of water is estimated to be the same as the sum of municipal water input and surface water input. The surface water input is estimated by Lars-Gunnar Larsson at the Rolling Mill at Ovako Steel AB in Hofors.	Output	Emission	Waste water	2.15		m3	River	Sweden
	Output	Product	Hot rolled round steel billets	1		tonne	Technosphere	Sweden
Data type: Economical information Notes: This is the purchased amount of bricks for production of 1 ton Hot rolled round steel billets. The brick residue is recycled back to one of the suppliers Fagerst Eldfasta, Bjuv or Höganäs.	Output	Residue	Brick	0.16		kg	Technosphere	Sweden
Data type: Economical information Notes: This is the purchased amount of dolomite for production of 1 ton Hot rolled round steel billets. The dolomite residue is deposited at the landfill within Ovako Steel land property.	Output	Residue	Dolomite	0.029		kg	Landfill ground	Sweden
Data type: Monitored data, discrete Notes: This is dust from shot blasting and grinding. The content is mostly FeO and Fe metal. The dust residue is deposited at the landfill within Ovako Steel land property.	Output	Residue	Dust	4.74		kg	Landfill ground	Sweden
Data type: Economical information Notes: This is the purchased amount of grease for production of 1 ton Hot rolled round steel billets. The grease residue is sent to a waste treatment company for destruction.	Output	Residue	Grease	0.054		kg	Technosphere	Sweden
Data type: Unspecified Notes: The hydraulic oil residue is assumed to be the same amount as the hydraulic oil input. It is sent to a waste treatment company for destruction.	Output	Residue	Hydraulic oil	0.115		l	Technosphere	Sweden
Data type: Monitored data, discrete Notes: The slag is granulate from the oxygen scarfing process. The slag residue is deposited at the landfill within Ovako Steel land property. The content of the slag (by weight-%): SiO2 0,04 MnO 0,034 P2O5 0,007 Cr2O3 1,02 NiO 0,13 MgO 0,02 CuO 0,27 V2O5 0,012 TiO2 0,004 Al2O3 0,02 FeO 75,2 CaO 0,01 Na2O 0,002 K2O 0,004 ZnO 0,01 PbO 0,003 C 0,31 S 0,009 Fe met. 23 (Iron as metal) Moist. 7,9 (Water)	Output	Residue	Slag	30.9		kg	Landfill ground	Sweden
Data type: Monitored data, discrete Notes: The sludge is from the oxygen scarfing process. The slag residue is deposited at the landfill within Ovako Steel land property. The content of the slag (by weight-%): SiO2 0,04 MnO 0,31 P2O5 0,01 Cr2O3 0,77 NiO 0,125 MgO 0,02 CuO 0,29 V2O5 0,012 TiO2 0,01 Al2O3 0,04 FeO 89,0 CaO 0,02 Na2O 0,005 K2O 0,008 ZnO 0,02 PbO 0,01 C 0,12 S 0,009 Fe met. 2,0 (Iron metal) Moist. 28,6 (Water)	Output	Residue	Sludge	9.06		kg	Landfill ground	Sweden
Data type: Monitored data, discrete Notes: The steel scrap is losses in the pit furnace, cutting, partitioning and other processes. The scrap is recycled back to the scrap yard at Ovako Steel.	Output	Residue	Steel scrap	144		kg	Technosphere	Sweden

About Inventory	
<b>Publication</b>	<p>The data will be published in the Master thesis: "LCA for the Plain Bearing GE30, Manufactured from Steel Tubes" by Jesper Nilsson, Göteborgs Universitet/Chalmers University of Technology in 2001.</p> <p>-----</p> <p>Data documented by Jesper Nilsson, MSc thesis worker at SKF. Documentation reviewed by Karolina Flemström, IMI, Chalmers University of Technology Data published in SPINE@CPM 2002-09-09</p>
<b>Intended User</b>	Suppliers and buyers of steel
<b>General Purpose</b>	The general purpose for this data inventory is to document data in a way suitable for LCA studies.
<b>Detailed Purpose</b>	<p>The data will be used in the Master thesis: "LCA for the Plain Bearing GE30, Manufactured from Steel Tubes" by Jesper Nilsson, Göteborgs Universitet/Chalmers University of Technology in 2001.</p> <p>The reason for carrying out this LCA was to describe the environmental performances of the SKF plain bearing GE30. The main purpose was to find out which activities during the life cycle of the GE30, that contribute to most negative environmental impacts. GE30 was chosen because there already was some life cycle inventory data available for this bearing type and because it is the most sold bearing at SKF Gleitlager.</p> <p>The plain bearing GE30 is manufactured from cold rolled steel tubes of quality SKF3, 100Cr6. <b>Sector</b>	Materials and components

<b>Owner</b>	Rolling Mill Ovako Steel AB 813 82 Hofors Sweden
<b>Technical system description</b>	<p>The following process steps are included in the data set:</p> <ol style="list-style-type: none"> <li>1. Pit Furnace</li> <li>2. Billet rolling, stand 1</li> <li>3. Oxygen scarfing</li> <li>4. Billet rolling, stand 2</li> <li>5. Partitioning</li> <li>6. Cooling bed</li> </ol> <p>The raw material is ingots from the Steel mill. When the ingots are put in the pit furnace they have a temperature of about 800 degrees Celsius. 6 of the furnaces have oxyfuel technology, 6 have oil/air combustion, 1 is heated with liquefied petroleum gas. In the furnace the ingots are heated till rolling temperature which is about 1200 degrees. When the rolling temperature is reached the ingots are soaked for three hours.</p> <p>The ingots are rolled in 26 passes down to 220 square and are thereafter sent through the oxygen scarfing. In rolling stand 2 the ingots are rolled down to 150 mm square billets. This is the final dimension and the billets are now cut and allowed to cool in the cooling bed till maximum 100 degrees.</p>

<b>System Boundaries</b>	
<b>Nature Boundary</b>	Emission to air and water are included. These are the main emissions and they are reported to the authorities in the annual environmental report. Emissions to soil are not known and not reported to the authorities. The water recipient is Hoån.
<b>Time Boundary</b>	The data are based on the production in the year 1998. In the beginning of the year 2000 the dimension of the billets produced will change from 150 mm square to 145 mm square.
<b>Geographical Boundary</b>	The Ovako Steel rolling mill is located in Hofors, Sweden.
<b>Other Boundaries</b>	Production of the raw material is not included. Production of electricity is not included. Transports are not included, except for internal transport with electrical industrial truck. Waste treatment is not included. Subsystems concerning employees are not included. Recycling of steel scrap is not included.
