The process of assessing and reporting sustainability at universities: Preparing the report of the University of Leeds

Rodrigo Lozano (PhD), Jordi Llobet (MSc), Gary Tideswell (MSc, LLM)

An increasing number of higher educational institutions have engaged in assessing and reporting their sustainability efforts. This paper presents the process undertaken to prepare the first draft of the University of Leeds sustainability report. The objective of the exercise was to provide a base and complement other sustainability initiatives taken at the University of Leeds. The process of developing the report was done in three stages: (1) collecting data; (2) populating the indicators; and (3) assessing the performance values from the information collected using the Graphical Assessment of Sustainability in Universities (GASU) tool. Although there were limited time and resources for the process, the results in indicator coverage and performance were higher than other the analysis of other HEIs that have published Global Reporting Initiative based reports. When preparing a sustainability report it is important to have a holistic perspective, addressing the different inter-relations between indicators, categories, and dimensions, as well as stakeholders throughout the university system.

Key words

Sustainability reporting, preparing a report, Global Reporting Initiative (GRI) guidelines, Graphical Assessment of Sustainability in Universities (GASU), University of Leeds

1. Introduction

There has been a rapid growth of higher educational institutions (HEIs) aiming to embed sustainability into their curricula, research, operations, outreach, and assessment and reporting (Calder & Clugston, 2003; Cortese, 2003; R. Lozano, 2006a), as well as making Sustainable Development (SD) an integral part of the institutional framework, on-campus life experiences, collaborating with other HEIs, and 'Educate-the-Educators' programmes (Huisingh & Mebratu, 2000; F. J. Lozano et al., 2008).

This paper presents the process of developing the first draft of the University of Leeds' sustainability report. It discusses the learning obtained from such process, and how this could be used by other HEIs in their journey towards preparing sustainability reports. The paper is structured as follows: the first section focuses on a discussion on sustainability reporting; it is followed by an overview and update of the Graphical Assessment of Sustainability in Universities (GASU) tool; then the methods (especially the process of developing the report) are explained; the next three sections present the results, discussion, and conclusions.

2. A discussion on Sustainability Reporting

Sustainability Reporting (SR) is a voluntary activity with two general purposes: (1) to assess the current state of an organisation's progress towards sustainability, and (2) to communicate to stakeholders the efforts and progress in the Economic, Environmental and Social dimensions (Dalal-Clayton & Bass, 2002; GRI, 2011).

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

It can also be used for assessing sustainability performance over time, benchmarking against other companies, and demonstrating how the organisation influences, and is influenced by, expectations about sustainable development (Daub, 2007; GRI, 2011; R. Lozano, 2006a; Schaltegger & Wagner, 2006).

SR has gained widespread recognition as an element of corporations' contributions to sustainability (Morhardt, Baird, & Freeman, 2002). During the last ten years there has been an increase in the number of published corporate Sustainability Reports (SRs) (ACCA, 2004; Andersson, Shivarajan, & Blau, 2005; GRI, 2009, 2013), particularly in Europe and Japan (Kolk, 2008). In spite of an increasing number of companies producing sustainability reports, the number of companies reporting is still insignificant compared with the total number of businesses operating in the world today. In the particular case of HEIs, the number of institutions is even smaller, with roughly 65 publishing full sustainability reports (compiled from Fonseca, Macdonald, Dandy, & Valenti, 2011; GRI, 2009, 2013; R. Lozano, 2011).

According to Burritt and Schaltegger (2010) there are two main paths for sustainability reporting: (1) the critical theorist approach, which sees SR as the cause and source of corporate sustainability problems; and (2) the management oriented approach, which sees SR as a tool to help managers deal with different decisions. They also indicate that there are two main approaches driving sustainability reporting: "outside-in", focusing on the opinion and perception of stakeholder towards the organisation; and "inside-out", relating to the decisions taken inside the organisation in regards to social and environmental problems, which strengthen the competitive position of the organisation. These two dimensions could be complemented by: (1) hierarchy flows, which include top-down or bottom-up (Doppelt, 2003); and (2) focus of the changes, whether through managerial measurement and control, or stressing the importance of internal change and innovation (Henriques & Richardson, 2005). Top-down processes facilitate incorporation but can limit institutionalisation if leadership is changed (R. Lozano, 2006a), while bottom-up processes can facilitate institutionalisation, but these efforts can be blocked by leadership (Kanter, 1999). Managerial measurement and control relies on strategic changes, whilst internal change and innovation relies on participative cultural changes, which are more proactive. Organisations have a higher degree of control over proactive changes, than over external stimuli led changes, *e.g.* political or economic change (Freeman, 1984).

As aforementioned, reporting can be used to manage sustainability performance. Schaltegger & Wagner (2006) proposed an approach to manage sustainability performance and economic performance more successfully by integrating the Sustainability Balanced Scorecard, sustainability accounting, and sustainability reporting. This approach links management, measurement, and reporting. However, it is theoretical and does not specify how to measure performance.

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

Daub (2007) proposed a quasi-quantitative analysis of 25 Swiss companies' sustainability reports, which provides a more practical quality and performance assessment.

SR presents a number of challenges, such as gaining knowledge, experience, and understanding of sustainability (Adams & McNicholas, 2007), providing the extra resources needed to gather data and engage stakeholders, and the need to keep a balance between the details and core information (Lozano, 2006). Additionally, the quality of the SR disclosures has yet to translate into meaningful and comprehensive SRs (ACCA, 2004), and in many cases data is selectively reported (Gray, 2006). Many of the reports fall short of the GRI/SR guidelines (Andersson, et al., 2005; Hussey, Kirsop, & Meissen, 2001; Wilenius, 2005). SR guidelines do not provide a framework to address or report upon possible synergies within, between, and among Sustainability issues (R. Lozano & Huisingh, 2011). Notwithstanding these challenges, SR has become an important driver and vehicle to engage with, and report on, a company's efforts towards becoming more sustainable (R. Lozano & Huisingh, 2011), as well as being a catalyst for change towards sustainability (for more details refer to Adams & McNicholas, 2007; Doppelt, 2003; R. Lozano, early view). In these changes, there is a need for rethinking the 'managerial capture' (Adams & Larrinaga-González, 2007), *i.e.* the way university managers understand and implement changes towards sustainability.

3. Sustainability assessment and reporting in higher educational institutions

Figure 1 shows that the number of HEIs publishing sustainability reports has increased steadily, from one in 2001 to 34 in 2012 (and a projection of 42 reports in 2013). Figure 2 shows that most of the reports have been published by European (54%) and American HEIs (32%), with the rest from Asia and Australia. It can be seen in Figure 3 that most HEIs have published only one sustainability report (41 out of 65 HEIs), with 13 publishing two reports, 7 publishing three reports, 1 with four reports, and 3 with five reports.

A large number of standards and guidelines have been developed during the last two decades to help assess the current state of an organisation's sustainability, communicate it to stakeholders, and manage it. The guidelines provide a systematic framework for addressing a myriad of sustainability issues (R. Lozano & Huisingh, 2011). From the range of tools and guidelines developed for sustainability reporting (see the comprehensive lists by Dalal-Clayton and Bass (2002) and Cole (2003)), the most widely used guidelines include: the ISO 14000 series (especially ISO 14031) and EMAS; the Social Accountability 8000 standard (SAI, 2007); and the Global Reporting Initiative (GRI) Sustainability Guidelines (GRI, 2002, 2006). Among these, the GRI Sustainability Guidelines offers one of the best options (Hussey, et al., 2001; R. Lozano, 2006b). The GRI Guidelines are voluntary and intended to serve as a generally accepted framework for reporting on an organisation's economic, environmental, and social performance (GRI, 2011).

Nevertheless, the GRI guidelines were not developed for HEIs (Cole, 2003; R. Lozano, 2006b). In the particular case of HEIs Shriberg (2002) compared the different guidelines developed, with examples such as the National Wildlife Federation's State of the Campus Environment, the Sustainability Assessment Questionnaire, Higher Education 21's Sustainability Indicators, and the Auditing Instrument for Sustainable Higher Education (AISHE). Lozano (2006b) modified the GRI Guidelines to include the core competence of HEIs, the Educational

TECNOLOGÍA Y
HUMANISMO

dimension, to develop the Graphical Assessment of Sustainability in Universities (GASU) (R. Lozano, 2006b). GASU provides a systemic and systematic way of assessing the indicators available, as well as their performance, which can then be used to prepare a sustainability report.

GASU has been used to analyse 12 universities that had published GRI Sustainability Reports up to 2009 (R. Lozano, 2011). **Table 1** shows the performance results for the economic, environmental, social, and educational categories. It can be seen that the universities analysed tend to focus on the economic and environmental dimensions in their sustainability reports.

Table 1. Results from the GASU analysis: The four Higher Education for Sustainable Development (HESD)'s dimensions. The maximum score attainable in each dimension is 100%.

4. Methods

This section presents a background on the University of Leeds and the process of preparing the sustainability report.

The University of Leeds has 33,000 students from over 142 countries: 25,000 are undergraduates and 8,000 are postgraduates. It offers 560 undergraduate degrees and 300 postgraduate degrees. The University has 7,645 staff from 97 different nationalities. The University has a total income of £517.7 million, with a total expenditure of £505 million (University of Leeds, 2010).

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

The sustainability report was commissioned by this paper's third author and developed by Organisational Sustainability Ltd using the Graphical Assessment of Sustainability in Universities (GASU) tool.

4.1.Updating the Graphical Assessment for Sustainability in Universities (GASU) tool

GASU 2006 was updated in 2011 to align it with the GRI G3 (2011), as well as adding Inter-linking issues and dimensions (R. Lozano, 2013; R. Lozano & Huisingh, 2011) to provide a more holistic coverage of sustainability issues and their interactions.

The Inter-linking issues and dimensions include the fol lowing categories and indicators:
▪Relations within the same dimension
       º Relations within the Economic dimension
           ▪ RS1. Tuition fees and Income
       º Relations within the Environmental dimension
           ▪ RS2. GHG emissions and Energy
           ▪ RS6. Transport and Emissions
       º Relations within the Social dimension
           ▪ RS3. Employee training and development with Health and safety
           ▪ RS4. Volunteering and philanthropy and Communities
       º Relations within the Educational dimension
           ▪ RS5. SD Research-led Teaching
▪Relations to issues in another dimension
       ▪ Relations between the Economic and Environmental dimensions
       ▪ RA1. Eco-efficiency and Earning
       ▪ RA2. Six Sigma and the Environment (This indicator does not apply to universities' context)
       ▪ RA9. Environmental accidents and Fines
       ▪ RA10. Purchasing and Environment
       ▪ Relations between the Educational and Social dimensions
       ▪ RA11. Training and education and SD curriculum
       ▪ RA12. Training and education and SD research
       ▪ RA13. Training and education and SD administrative support
       ▪ Relations between the Environmental and Social dimensions
       ▪ RA3. Communities and the Environment
       ▪ RA4. Communities and Biodiversity
       ▪ RA5. Employee training and Eco-efficiency
       ▪ RA6. Environment and Health and Safety
       ▪ RA7. Products (This indicator does not apply to universities' context.)
       ▪ RA8. Water and Communities

▪Relations among all dimensions
- ᵒ RT1. Accidents and remediation
- ᵒ RT2. Green buildings and Social dimension
- ᵒ RT3. Supply chain (This indicator does not apply to the University of Leeds context.
- ᵒ RT4. Time dimension (The report provides the bases to explore past and current activities, and those planned for the future that are contributing to the Economic, Environmental, and Social dimensions, as well as how to connect them to the core competencies of the University: Education and Research.

GASU provides graphical assessments of a HEI sustainability efforts, facilitating their analysis, longitudinal comparison, and benchmarking against other HEIs, with respect to: Profile; Economic dimension; Environmental dimension; and Social dimension, as well as the Educational dimension and Inter-linking issues and dimensions. Table 2 shows the dimensions, with their categories and aspects.

Table 2. Graphical Assessment of Sustainability in Universities (GASU 2011) dimensions and categories

The numbers of performance indicators in GASU 2011 are: 43 for the profile, 9 for the economic, 30 for the environmental, 40 for the social part, 29 for the educational, and 23 for the Inter-linking issues and dimensions. The large number of indicators demands a large amount of resources to create a full report, as well as for its analysis.

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

The indicators are analysed by using the following grades, following Daub's (2007) approach and Lozano's GASU (2006b) criteria:

0. There is a total lack of information for the indicator, it is non-existent, or the information was not found;
1. The information presented is of poor performance. This is given when there is some information, but it is too general or it has little detail or coverage;
2. The information presented is of regular or fair performance. This is assigned when the data covers around half of the issues in the indicator, or when there is good detail but it only covers some areas (for example for the curriculum category);
3. The information presented is considered to indicate of good performance. This is given when there is not enough detail, the information or coverage is not thorough, or an issue has not been addressed;
4. The information indicates excellent performance. This is assigned when there is complete and detailed information for that particular indicator. It is also assigned for indicators that do not apply to the University or to the context.

GASU provides information about the percentage of indicators where information is available against the total number of indicators in each aspect, category and dimension, as well as for the entire report. GASU results are presented in eleven charts (combining indicator coverage and indicator performance as proposed by Lozano (2013) in the following dimensions:

- General chart (performance with respect to Profile, Economic dimension, Environmental dimension, Social dimension, Educational dimensions, and Inter-linking issues and dimensions);
- Profile;
- Economic dimension;
- Environmental dimension;
- Social dimension (5 charts): Overall, Labour Practices and Decent Work, Human Rights, Society, and Product Responsibility;
- Educational dimension; and
- Inter-linked issues and dimensions.

GASU can help HEIs on their road towards sustainability by making recommendations as to where the HEI should effect the changes needed to make its system more sustainability orientated, and thus be better aligned with the UN Decade of Education for Sustainable Development. GASU can also facilitate comparisons of the HEI's efforts and achievements towards sustainability in different years, as well as benchmarking against other HEIs.

5. Preparing the University of Leeds draft sustainability report

The objective of the exercise was to provide a base and complement other sustainability initiatives taken at the University of Leeds. The process of developing the report was in three stages: (1) collecting data; (2) populating the indicators; and (3) assessing the performance values from the information collected. The data was analysed with an updated version of the GASU tool.

5.1. Collecting data

The information was collected by this paper's second author, between March and July 2011, under the supervision of the first author. Most of the information gathered was for the academic year 2009-2010, although some information was only available from 2005-2006.

Table 3. Information location or provider for the indicators in each GASU (2011) dimension and category

dimension	Category	Information location or provider for this report
Profile		University web pages
Economic		Annual report and accounts and University web pages
Environment		Sustainability Development office (e.g. Environmental policy, Sustainable purchasing policy, Fair Trade policy, Environmental co-ordinators, Environmental Management Systems (EMS), Energy Management, and Transport policies)

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

The first step in the data collection was to review the university's web pages to try to obtain as much available information as possible, as well as to understand the university's structure. Some information was obtained from statistical calculation from available databases, such as the SAP system and the Higher Education Statistics Agency (HESA, 2011).

The second step was to locate who was the owner or responsible of the information not available on the web pages, and to carry face-to-face or phone interviews to acquire the data. Table 3 shows where the information for the different dimensions and categories was obtained from, whether through secondary or primary sources.

5.2. Populating the indicators

The next stage was to populate the indicators. As Table 3 shows the ones for the Profile and Economic dimensions were obtained mainly from secondary sources, such as the University's Annual Report and Accounts (University of Leeds, 2010) and web pages. The indicators for the Environmental dimension were mainly obtained through from the Estate and Campus Support Services, with additional input for the Biodiversity indicators. The indicators of the Labour Practices and Decent Work category were acquired from people in different departments and schools. The information for the Society category was provided by Legal affairs. The information on Product Responsibility was obtained from University web pages. There was no information found for the Human Rights category.

The Educational dimension indicators were obtained through the Sustainability Tool for Assessing UNiversities' Curricula Holistically (STAUNCH®)[1] project (for details on the project refer to R. Lozano & Young, 2013) assessment the Faculty of Business, and the Faculty of Environment. The assessment was done for 2,761 Bachelor and Post-graduate taught degrees during the academic year 2010-2011. The analysis was performed according to the information in the module descriptors.

Once all the information was collated, it was triangulated to check for consistency and reliability; whenever there was a doubt the individuals involved were contacted again.

The next step was to integrate the indicators to populate the ones in the Inter-linking issues and dimensions, followed by the assessment of all the indicators.

5.3. Assessing the performance values from the information collected

As aforementioned, the assessment of the indicators was based on Daub's (2007) quasi-quantitative analysis using Lozano's GASU (2006b) criteria for

---

Preparing the report of the University of Leeds**

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

each of the indicators in the Profile; Economic dimension, Environmental dimension, and Social dimension; as well as the Educational dimension and Inter-linking issues and dimensions.

Once these steps were done a 102 pages report was written, providing details for each GASU 2011 indicator, as well as a discussion on each dimension and the twenty-two graphs generated by GASU. The results are presented in section 6.

5.4. Method caveats

One of the first challenges when preparing the report was to become familiar with the university's structure. Although HEIs tend to have similar systems, each one has its own peculiarities in its structure.

Some of the challenges in the data collection or analysis included: the information from the SAP software was input by different individuals with possibly different criteria and priorities. The information for the Product responsibility category was obtained from the National Student Survey, this might not be totally representative of the numbers per faculty, since some of the subjects names are slightly different from those offered in the University faculties. Another challenge in the data collection was the limited time assigned to locate the data. Some of the information was not publicly available, or was not explicit in regards to the GASU indicators. This was particularly prevalent for indicators within the Human Rights and Society categories in the Social dimension. These two dimensions are covered by the U.K.'s laws and regulations, which apply to all types of organisations, including HEIs. Two issues were particularly challenging: (1) the information was scattered through different offices, departments, and centres; and (2) there seems to be no shared understanding within the university of sustainability or how it can be implemented more holistically throughout the university.

The sustainability report exercise was facilitated by the experience in sustainability reporting from this paper's first two authors, and the access provided by this paper's third author. This meant that there was the researchers knew exactly which information they were looking for, and this was enabled by the right access to it, despite the limited time and resources.

6. Sustainability Report Exercise Results

Table 4 and Figure 4 show the coverage and performance of the indicators in the Profile were easily available (almost 80% obtained), followed by those in the Economic, and Environmental dimensions (over 60%). The ones in the Social and Educational dimensions were more difficult to obtain (less than 50%). Those in the Inter-linking issues and dimensions were collated from

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

other indicators. The performances of the Profile and Economic indicators are relatively high (around 60%). The ones for the Environment and Inter-linking-issues and dimensions are medium (around 40%), those for the Social dimension are low (almost 30%), mainly due to the information from Human Rights and Society not being made explicit. The Educational dimension tends to be quite low (less than 20%), mainly due to the difficulty of obtaining information for the Research category. The SD incorporation in the curriculum category tends to be good (50%). The indicators for the Profile section were easy to obtain, and they had a relatively good performance. In general, information about the Economic dimension was found in the Annual Report and Accounts (see University of Leeds, 2010), which resulted in the good performance of the Economic Performance category. The ratios between coverage and performance range from 0.4915 to 0.8611. This shows that performance accounts for roughly two thirds of coverage, with the exception of the educational dimension, where it is half. The shapes in Figure 4 show that 'performance' is fairly congruent with 'coverage', which indicates that performance in each of the categories could still be improved in the reports.

The following paragraphs present the results for the Environmental, Social, Educational, and Inter-linking issues and dimensions[2] in regards to indicator coverage and indicator performance. Illustrative graphs are provided for the Overall results, the Educational dimension, and the Inter-linking issues and dimensions.

Table 4. Percentage of GASU 2011 indicators coverage and their performance

Sustainability Reporting dimension	Indicators coverage	Indicators performance	Performance-coverage ratio
Profile	76.74%	61.05%	0.7955
Economic	66.67%	57.41%	0.8611
Environment	63.33%	40.67%	0.6422
Social	45.00%	29.53%	0.6562
Educational	37.93%	18.29%	0.4915
Inter-linking issues and dimensions	56.52%	40.00%	0.7077
Total	57.47%	42.06%	0.7955

Table 5 shows the indicator coverage in the Environmental dimension and their performance in respect to the GASU 2011 Environmental Dimension indicators. There was considerable information for the Environmental dimension, where the information was available through the Sustainable Development Team. All the indicators for the Biodiversity, Products and services, Compliance, and Transport were found; a large number of those for Emissions, effluents, and waste were obtained (70%); and some of Energy, and Water (40% and 33% respectively). No indicators were found for Materials and Overall. The information for the Transport category was excellent, due to a transport survey. Only direct energy was considered, where the information was generally good. For Emissions, effluents, and waste, the Carbon Management Plan provided good information; however, it was still in the process of being executed. There was no information about emissions and effluents other than carbon, *e.g.* ozone depleting substances, NOx, and SOx. There was also no information available for the Materials category, or for the total environmental protection expenditures and investment (in the Overall category) . The performances with respect to the GASU 2011 Environmental dimension indicators were varied. The performance for Products and Services, and Transport are excellent; Biodiversity has good performance (61%), and those for Emissions, effluents, and waste, Energy, Compliance, and Water have low performance. The ratios between coverage and performance range from 0.25 to 1.00. This shows a large variation, where some categories are fully covered and some not even considered.

Overall	0.00%	0.00%	-
Total	63.33%	40.67%	0.6422

Table 6 shows the indicator coverage in respect to the total indicators in the Social dimension and their performance in respect to the GASU 2011 Social dimension indicators. Information for the Social dimension varied considerably within its categories; for some categories it was easy to obtain (Labour Practices and Decent Work category, for example), but not so easy for others. It should also be noted that there was no central co-ordination or management strategy for collecting/collating information in the Social dimension. A large number of the indicators for the Labour practices and decent work category were found (71%), a fair number of the ones of Product responsibility (44%) and Society (38%), but a low number for the Human Rights ones (11%). The Human Rights and Society categories have low scores because the issues were not made explicit; although this should not be a problem for a Western European University. The Product responsibility category was analysed from the perspective that a University has responsibility for the quality of service to its students. For this category there was some information (*e.g.* for Customer health and safety and for customer satisfaction). The performances with respect to the GASU 2011 Social dimension indicators are varied. The Labour practices and decent work indicators have a fair performance (47%), the ones for Product responsibility and Society have a low performance (29% and 23% respectively), while those for Human Rights are quite low (13%). As indicated previously, human rights and society indicators are covered by U.K.'s laws and regulations, for which universities have to comply. The ratios between coverage and performance range from 0.6021 and 1.1611. The performance is in general two thirds of the coverage. The exception is in Human Rights, where only one of additional indicator is present, and this is fully covered thus giving a higher performance than coverage.

Table 6. Percentage of GASU 2011 indicators coverage and their performance for the Social dimension

Category	Indicators coverage	Indicators performance	Performance-coverage ratio
Labour Practices and Decent Work	71.43%	47.92%	0.6709
Human Rights	11.11%	12.90%	1.1611
Society	37.50%	22.58%	0.6021
Product Responsibility	44.44%	28.57%	0.6429
Total	45.00%	29.53%	0.6562

Figure 5 and Table 7 show the indicator coverage and performance in respect to the GASU 2011 Educational dimension indicators. All the indicators for SD incorporation in the curricula, and Programmes and centres were found. The curricula assessment, using the STAUNCH® tool, provided detailed information about SD incorporation into the curricula for two faculties (Business and Environment). If the assessment had been done for the entire University, the coverage and performance outcomes would have been much better. A good number of the indicators for Administrative support, and SD monitoring in the curricula (67% and 50%) were obtained, whilst there were low numbers of the ones for Community activity and service (33%), and Research in general (11%). There was no information found for SD capacity building, Grants, Publications and products, Service learning, and Declarations. The indicators for Programmes and centres had a good performance (75%), the ones for SD incorporation in the curricula, fair one (50%), while those for Administrative support, SD monitoring in the curricula, Community activity and service, and Research in general are low (25%, 19%, 17%, and 5% respectively). The ratios between coverage and performance ranged from 0.3750 to 0.75. This shows that performance in this dimension is quite varied, but also that some of the aspects were not covered. The shapes in Figure 5 show that 'performance' is fairly congruent with 'coverage'. Several centres and departments in the University were involved in research about sustainability; however, this information was scattered. A project to assess and manage the information about SD research would help to improve the University's performance in this category. The SD Service category should go beyond presenting information about student associations focusing on the environment, where the University looks into providing more organised and bespoke support for these associations. As indicated by Lozano (2011) the educational dimension is usually the least addressed. The coverage and performance in this category could be improved considerably.

Figure 6 and **Table 8** show the indicator coverage and performance in respect to the GASU 2011 Inter-linking issues and dimensions indicators. A good number of the indicators for Relations among all dimensions and Relations within the same dimension (75% and 68% respectively) were found, and almost half of those for the Relations to issues in another dimension. The indicators for Relations among all dimensions, and Relations within the same dimension have a fair performance (56% and 54% respectively), and performance for Relations to issues in another dimension was low (23%). The ratios between coverage and performance range from 0.5000 to 0.8125. This shows that performance accounts between half and four fifth of coverage. The shapes in Figure 6 show that 'performance' is fairly congruent with 'coverage', which indicates that performance in each of the categories could still be improved in the reports.

The results of the indicators coverage, and their performance in the Inter-linking issues and dimensions categories, showed that the University was already tackling some issues holistically. These efforts should be recognised and encouraged, so that there are better connections between the different dimensions, and improved interactions between operations, education, research, outreach, and assessment and reporting.

Table 8. Percentage of GASU 2011 indicators coverage and their performance for the Inter-linking issues and dimension

| Category	Indicators coverage	Indicators performance	Performance-coverage ratio
Relations within the same dimension	66.67%	54.17%	0.8125
Relations to issues in another dimension	46.15%	23.08%	0.5001
Relations among all dimensions	75.00%	56.25%	0.7500
Total	56.52%	40.00%	0.7077

Preparing the report of the University of Leeds**

7. Discussion

This SR exercise was aimed at developing the first draft of the University of Leeds sustainability report. This was intended at providing an indication of what issues were being covered and to what extent. It was an "inside-out" approach, allowing the university to be proactive, and framed by a "managerial orientation", by focusing on managers' decisions (as posited by Burritt & Schaltegger, 2010). It was also based on a 'managerial measurement and control' approach (see Kanter, 1999). These pragmatic decisions allowed the report to be prepared in relatively little time; however, they did not take into consideration stakeholders and their perceptions, which can lead to resistance from different groups (as posited by R. Lozano, early view). The quasi-quantitative approach based on Daub's (2007) approach and Lozano's GASU (2006b) criteria allowed to obtain the coverage and the performance of the indicators, aspects, categories, and dimensions for the report.

In general, there was congruence between 'coverage' and 'performance', with the latter usually lower, which concurs with Lozano (R. Lozano, 2013). The lowest ratio between coverage and performance range was one quarter, with an average of three quarters. This indicates that performance in each of the categories could still be improved in the reports.

Developing the report presented a number of challenges, such as extra resources to gather data (see R. Lozano, 2006b) to populate the 174 indicators in the updated GASU. Nonetheless, the experience allowed to provide a good coverage of the GRI guidelines (addressing Andersson, et al., 2005; Hussey, et al., 2001; Wilenius, 2005 point about reports falling short of the GRI guidelines) and showing the synergies within, between, and among sustainability issues (as indicated by R. Lozano & Huisingh, 2011). It was not possible to find information for some indicators, for reasons such as; the short time allocated for the project, information not being made explicit, difficulties finding or accessing data, compartmentalisation of information, and not having a common understanding of sustainability throughout the University.

One of the purposes of sustainability reporting is to benchmark against other institutions (see Daub, 2007; GRI, 2011; R. Lozano, 2006a; Schaltegger & Wagner, 2006). Table 9 shows that the comparison of the present Report with the sustainability reports of 12 other HEIs that have published Sustainability Reports. It shows that the University of Leeds draft sustainability report has better performance values than the other HEIs in all the dimensions and their averages, except for the Educational dimension, where UBC has the better performance than the University of Leeds.

The results from the SR exercise demonstrate the potential for the University to: overcome the compartmentalisation problem (as indicated by R. Lozano *

& Huisingh, 2011); provide a framework to reduce the lack of knowledge and understanding of sustainability (see Adams & McNicholas, 2007); and balance the details and core information (see R. Lozano, 2006b).

Table 9. Performance from the GASU analysis of thirteen university sustainability reports. The maximum score attainable in each dimension is 100%.

Institution	Economic	Environmental	Social	Educational	Inter-linking
Birmingham	7.95%	7.22%	3.54%	3.92%	*

Turku	26.14%	26.67%	18.66%	8.73%	*
Leeds	57.41%	40.67%	29.31%	18.29%	42.06%
Averages	17.44%	20.39%	11.02%	8.40%	-

*: Not available, since these indicators are not explicitly considered in the reports Source: Adapted from (R. Lozano, 2011)

In future developments, the University of Leeds could engage with its stakeholders to further develop and validate the Report (as indicated by Burritt & Schaltegger, 2010; R. Lozano, 2006a). This necessitates planning internal change (see Henriques & Richardson, 2005; Kanter, 1999; R. Lozano, early view) and incorporating sustainability into the entire university system (see Calder & Clugston, 2003; Cortese, 2003; R. Lozano, 2006a; R. Lozano, Lukman, Lozano, Huisingh, & Lambrechts, 2013).

8. Conclusions

HEIs are increasingly recognising their role in helping societies become more sustainable. Comprehensive sustainability assessment and reporting can help to communicate the university's efforts more systematically and effectively to its stakeholders, to assess coverage and performance, and benchmark against other institutions. Although some HEIs have engaged in this process, the percentage of HEIs publishing sustainability reports is still small compared to

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

the number of HEIs worldwide, and to the number of companies publishing sustainability reports.

This paper presents the process of developing the first draft sustainability report for the University of Leeds, where the key challenges faced were the limited amount of time allocated for data collection, the compartmentalisation of the data, and the lack of a common understanding of the sustainability concept (even though it appears in different university policies).

The results from the Inter-linking issues and dimensions show that even where the information is compartmentalised, it is possible to find indicators that relate to others in other dimensions. Thus, confirming that sustainability is holistic and integrative, i.e. it is as much about the issues as it is about there between indicators, categories, and dimensions, as well as effective functioning throughout the whole university system (curricula, research, operations, outreach, and assessment and reporting), where linking Operations, Education, and Research is crucial.

A gap analysis of the GASU results can help to focus on coverage and performance weaknesses, thereby highlighting where remedial action is to be taken and better plan changes to pursue a more holistic SR. The coverage and performance of the indicators tend to be fairly congruent; however, the latter is usually lower, which indicates that the understanding and addressing the sustainability dimensions could be improved.

GASU can help HEIs on their road towards sustainability by making recommendations as to where the University should effect the changes needed to make its system more sustainability orientated, and thus be better aligned with the UN Decade of Education for Sustainable Development. GASU can also facilitate comparisons of the University's efforts and achievements towards sustainability in different years, as well as benchmarking against other HEIs.

The paths, approaches and hierarchy flow can help university leaders decide, depending on their context and priorities, which is the most suitable ones for their institution's change efforts for sustainability. A sustainability report can also serve as the basis for a necessary common understanding of SD within the institution.

In the process of preparing the report is it important to have sufficient time, access for data collection, and to engage with stakeholders. The exercise, once done, should be updated periodically, for example through an interactive web page where the information can be made available at any and all times. The university should make explicit which indicators from the guidelines do not apply in the University context. A SD champion should be appointed, who has access to the required data, or at least have direct access to those who would facilitate it.

**The process of assessing
and reporting sustainability at universities:
Preparing the report of the University of Leeds**

SOSTENIBILIDAD
TECNOLOGÍA Y
HUMANISMO

The inclusion of the Educational dimension should make the GRI more relevant to HEIs, whilst the inter-linking issues and dimensions category provides a more holistic and integrative perspective to the indicators.

The reporting exercise would be more beneficial if it is integrated to other sustainability efforts being done at the university. It can also help to trigger change by pointing out where the opportunities for improvement in indicator coverage and performance are.

This paper shows that, although it might look like a daunting task, sustainability reporting can be facilitated if there are individuals who understand the concept and complexity of sustainability, and they are supported by managers who are engaged in making their institutions more sustainability orientated. Such an exercise can facilitate the diffusion of sustainability reporting and help to better embed sustainability into a university's system.

From this research, it is possible to state the following aphorism: Sustainability reporting is a necessary step for HEIs and their leaders to detect current efforts and plan future ones.

Further research should take place on: (1) the different higher educational institutions to learn from their experiences in preparing sustainability report; (2) the indicator coverage and performance of the university reports published so far should be carried out; and (3) a longitudinal analysis of the institutions that have published more than one report.
