## INSPECTION OF COMMERCIAL FEEDING-STUFFS

---

ANALYSES OF COMMERCIAL FEEDING-STUFFS  
COLLECTED BY THE COMMISSIONER OF  
AGRICULTURE, 1923.

---

### INTRODUCTION

The New Hampshire Feeding-Stuffs law requires that before feeds may be offered or exposed for sale in the state they must be registered with the Commissioner of Agriculture. The feeds must also be properly labeled showing the minimum percentage only of protein, fat and carbohydrates and the maximum percentage of crude fiber. The object of the law is to have the feeding-stuffs correctly labeled in order that the purchaser may know the kind of feed he is buying. In order to enforce the law the Commissioner of Agriculture directs the State Inspector to visit the various feed warehouses throughout the state, collect samples and submit them to the Agricultural Experiment Station for analysis.

This report deals with the inspection of commercial feeding-stuffs for the year 1923, made under the direction of the Honorable Andrew L. Felker, Commissioner of Agriculture. Mr. E. D. Sanborn, State Inspector, visited most of the feed warehouses in the state and collected 261 samples of feeds.

### QUALITY OF FEEDING-STUFFS ANALYZED.

The relative number of feeds in the respective classes is similar to that of the past two seasons. There is a decrease in the number of oil meals and an increase in the dairy feeds. The quality of the feeding-stuffs shows a

slight improvement over those of last year and a very decided improvement over those of two years ago. The deficiencies in guaranteed analyses are less frequent than in the preceding two years. The largest percentage of deficiencies in analysis is found in the compound feeds, cottonseed meals and oil meals. Only 2 per cent. of the samples analyzed were seriously deficient in both protein and fat.

### CLASSIFICATION OF FEEDING-STUFFS ANALYZED.

In classifying the feeding-stuffs the class names under which they have been sold have been used. Table Number 1 shows the number of feeding-stuffs in each class, the average per cent. of protein and fat found and the price per 100 pounds.

TABLE NUMBER I.

Class	No. of Feeds	Average Per Cent. Protein	Average Per Cent. Fat	Average Price per 100 lbs.
Alfalfa Meal .....	3	15.04	2.03	2.26
Beet Pulp .....	4	9.23	0.53	3.03
Calf Meal .....	3	25.75	4.38	4.85
Compounded Feed .....	31	10.51	4.62	2.16
Corn and Oat Feed .....	3	10.33	4.62	2.33
Cottonseed Meal .....	18	39.86	6.92	2.97
Lairy Feed .....	43	22.53	5.36	2.59
Gluten Feed .....	5	28.50	3.30	2.64
Hominy Feed .....	9	10.97	6.58	2.13
Linseed Meal .....	6	32.94	6.33	3.18
Oat Feed ..	1	5.43	2.03	1.05
Poultry Feed .....	31	26.89	7.16	3.66
Wheat Feed .....	104	16.16	5.01	1.96
Total .....	261			

## DEFICIENCIES IN ANALYSIS

Table Number 2 shows the number of samples found deficient in protein and fat, the number of samples deficient in both protein and fat and also the percentage number of each class showing such deficiencies. In making up the table only those deficiencies of one-half of one per cent. or more of protein and one-fourth of one per cent. or more of fat were used.

TABLE NUMBER II

Class	No. in Class	No. Def. $\frac{1}{2}$ % Protein	No. Def. $\frac{1}{4}$ % Fat	No. Def. both Protein and Fat	% Def. $\frac{1}{2}$ % Protein	% Def. $\frac{1}{4}$ % Fat	% Def. both Protein and Fat
Alfalfa Meal .....	3	0	0	0	0	0	0
Beet Pulp .....	4	0	0	0	0	0	0

## WHAT DOES THE CHEMICAL ANALYSIS MEAN?

In a feed analysis the following determinations are usually made: protein, fat, carbohydrates, ash, moisture and crude fiber.

*Protein* is determined by finding the percentage of total nitrogen and multiplying this by the factor 6.25, since it has been found that the average proteins contain 16 per cent. nitrogen. While this includes small amounts of certain other compounds which contain nitrogen, for all practical purposes it is sufficiently accurate. Protein, then, is made up of the compounds in the feed which contain nitrogen.

*Fat* is determined by extracting a dried sample of the feeding-stuff with ether and weighing the residue after the ether is driven off. In main it contains the vegetable fats of which olive oil, linseed oil, and cottonseed oil are examples. It contains also small amounts of chlorophyll, (the green coloring matter of the leaves), waxes, resins, etc.; but for practical purposes it is accurate enough to deal with it as fat.

*Ash* is determined by weighing the residue after the feeding-stuff has been burned at a low temperature. It contains the mineral matter of feeding-stuffs.

*Moisture* is determined by finding the loss in weight after heating at the temperature of boiling water. It shows the amount of water that the feed contains.

*Carbohydrates* are determined by adding the percentages of the protein, fat, moisture and ash, and subtracting the total from 100 per cent. The carbohydrates are composed largely of starches, sugars, pentosans, celluloses, etc. The carbohydrates include the crude fiber also. The percentage of carbohydrates less the percentage of crude fiber is called *nitrogen free extract*.

*Crude Fiber* is made up of the more woody-like carbohydrates which are largely of a cellulose nature. Pure cotton is an example of almost pure cellulose. Wood, straw, corn fodder, etc., are materials which are high in crude fiber content.

### WHAT ARE FOODS FOR ANIMALS?

In order that an animal may continue to live even without making growth or producing wool, eggs, milk or work, etc., there are certain food materials which it must have. The animal must have a certain amount of protein, fat, carbohydrates, water and mineral constituents. In addition other things known as "vitamines," "growth promoting substances," or "food accessories," the chemical nature of which we know very little, are necessary. The latter substances, however, are usually present in sufficient quantities in our regular feeding-stuffs if we feed a sufficient variety and particularly if we feed a good leguminous roughage. Our feeding-stuffs usually contain mineral matter sufficient for the needs of an animal with a few exceptions, such as calcium carbonate, which we furnish as oyster shells for hens, and phosphorus and calcium which is sometimes fed to dairy cattle and pigs in the form of bone meal. If alfalfa or clover is fed as a roughage they will aid very much in furnishing a proper mineral supply. *The protein, fat and carbohydrates are the foods which we are particularly interested in when we buy commercial feeding-stuffs and it is their content which largely determines the value of the feed.*

### DIGESTIBILITY IMPORTANT IN DETERMINING THE VALUE OF FEED.

When fed not all of the protein, carbohydrates and fat in the different feeding-stuffs are digested. In comparing the value of the different feeding-stuffs, especially when they are of different types, we must take into consideration the digestibility of these food nutrients. The *coefficient of digestibility* is a term which expresses the percentage amount

of the food nutrients which are digested and absorbed by the animal. Table Number 3 gives a summary of the average results for some of our common feeding-stuffs.

TABLE NUMBER III

AVERAGE DIGESTIBILITY OF FEEDING STUFFS, WITH RUMINANTS EXPRESSED IN PERCENTAGE

(Taken from "Feeds and Feeding" by Henry and Morrison.)

Corn Silage Dent Mature ..	66	51	65	71	82

We have this data for the pure grains and feeds, but because the various proprietary feeds are not standardized there are not data available for them.

### HOW TO USE TABLE NUMBER 3.

Only the digestible nutrients are of value and so in comparing two feeds we should compare just the digestible nutrients. Suppose we had a cottonseed meal which analyzed 38 per cent. protein. The table shows cottonseed protein to be 84 per cent. digestible. We then would have 84-100 of 38 lbs., or 31.9 lbs. of digestible protein per 100 pounds. If a wheat bran analyzed 15 per cent. protein we see from the table that it is 78 per cent. digestible and we would have 78-100 of 15 or 11.7 lbs. of digestible protein. The cottonseed meal would have 31.9 lbs. compared with 11.7 in wheat bran.

### HOW TO FIGURE THE COMPARATIVE VALUE OF FEEDS FROM THE CHEMICAL ANALYSIS.

Because such factors as palatability, quality of protein, digestibility, etc., play an important part in determining the value of feeding-stuffs it is difficult to make an exact comparison of their value from a chemical analysis. The analysis will, however, serve as a very valuable guide. Since the farmer can usually raise carbohydrates cheaper than he can purchase them he is chiefly interested in buying the concentrated feeding-stuffs for their protein and fat content.

Feeds may be compared upon the basis of the number of pounds of protein and fat one dollar will buy. An example is as follows: Feed number 93 sells for \$1.90 per 100 pounds and is guaranteed protein 8.50 per cent. and fat 3.50 per cent. If it contains 8.50 per cent. protein there are 8.50 pounds of protein in 100 pounds of feed costing \$1.90. Then one dollar will buy 8.50 divided by 1.90 or 4.5 pounds of protein and 3.50 divided by 1.90 or 1.8 pounds

of fat. Feed number 45 sells for \$1.70 per 100 pounds and is guaranteed 16.00 per cent. protein and 5.50 per cent. fat. Then one dollar buys 16.00 divided by 1.70 or 3.2 pounds of protein and 5.50 divided by 1.70 or 3.2 pounds of fat.

*In other words in feed number 45 the consumer receives more than twice as much protein and nearly twice as much fat per dollar as in feed number 93. These figures represent two feeds of the same type which were sold in New Hampshire in 1923. In comparing feeds of the same class this method shows fairly accurately their relative value. When feeds of different types like a cottonseed meal and a hominy feed are compared the digestible protein figures should be compared and the carbohydrates must also be taken into consideration.*

Table Number 4 shows the average number of pounds of protein and fat one dollar would buy for each class of the feeding-stuffs analyzed in 1923.

TABLE NUMBER IV

Class	No. of lbs. of Protein \$1.00 will buy	No. of lbs. of Fat \$1.00 will buy
Alfalfa Meal .....	6.7	0.9
Beet Pulp .....	3.0	0.2
Calf Meal .....	5.3	0.9
Compounded Feed .....	4.9	2.1
Corn and Oat Feed .....	4.4	2.0
Cottonseed Meal .....	13.4	2.3
Dairy Feed .....	8.7	2.1
Gluten Feed .....	10.8	1.3
Hominy Feed .....	5.1	3.1
Linseed Meal .....	10.4	2.0
Oat Feed .....	5.1	1.9
Poultry Feed .....	7.3	2.0
Wheat Feed .....	8.3	2.6

## ECONOMICAL CHOICE OF PROTEIN FEEDS.

Feeding trials with dairy cows have shown that when alfalfa or clover hay and silage are fed as roughages there is little difference in the efficiency of gluten feed, oil meal or cottonseed meal as sources of protein. If you are feeding a good quality roughage it is advisable in making a ready mixed ration to use the protein rich feeds which furnish the digestible protein at the lowest cost. When linseed oil meal furnishes more pounds of protein per dollar more of it should be used and when cottonseed meal furnishes more pounds of protein per dollar more cottonseed meal and less linseed meal should be used. *Study the analysis of the feeds and buy economically. It will pay!*

## COMPARATIVE VALUES OF COTTONSEED MEALS.

Eighteen samples of cottonseed meals were analyzed. A comparison of the analyses and selling prices shows that the higher the analysis the cheaper the cost of protein is per pound. Table Number 5 shows the number of samples analyzed under each percentage, the price per 100 pounds and the average number of pounds of protein that one dollar will buy in each case.

TABLE NUMBER 5

## COTTONSEED MEALS

Guaranteed Per Cent. of of Protein	Number of Samples	Average % of Protein Found	Average Price per 100 Pounds	No. Pounds Protein \$1.00 Will Buy
36	8	36.11	\$2.95	12.2
38	0	.....	.....	.....
41	3	41.43	3.00	13.8
43	7	43.48	2.99	14.5

One dollar would buy 12.2 pounds of protein in the 36 per cent. cottonseed meals and 14.5 pounds in the 43 per cent. cottonseed meals. *Or in other words one dollar would buy over eighteen per cent. more protein in the 43 per cent. cottonseed meal than in the 36 per cent. meals.* The average price per ton of the higher analysis meals is higher but the cost per pound of protein is less. *Determine the comparative value of the feeds offered for sale before purchasing. Buy intelligently!*

### READY MIXED FEEDS SHOULD BE PROPERLY BALANCED.

In selecting a ready mixed feed such as a dairy feed it is well to examine the analysis and see that the feed is properly balanced for use with the kind of roughage which you feed. The Dairy Department of the University of New Hampshire recommend for use with a high protein roughage a feed containing 15 per cent. crude digestible protein, for use with a medium protein roughage a feed containing 17 per cent. crude digestible protein, and for use with a low protein roughage a feed containing 19 per cent. crude digestible protein. The analysis of a feeding-stuff shows the crude protein of which a portion is not digestible. While it is impossible to give an accurate figure for the digestibility of ready mixed feeds it will be approximate to assume that from 80 to 85 per cent. of the crude protein is digestible. On such a basis for use with a high protein roughage a ready mixed dairy feed should contain at least 17.5 per cent. protein with a medium protein roughage at least 20.00 per cent. protein and with a low protein roughage at least 22.00 per cent. protein.

### IMPORTANCE OF ALFALFA AND CLOVER

Recent studies in animal nutrition and feeding trials have led to discoveries which have a very important bearing upon practical feeding. It has been shown for instance

that not all proteins are of equal value, that our feeds may be deficient in certain mineral elements particularly phosphorous and calcium and that certain substances known as vitamins are essential for the proper development of animals.

If dairy cattle or swine are fed certain concentrated feeding-stuffs with a poor roughage such as corn stover, straw, or possibly native hay, the feeding value of the concentrates is not nearly so great as when the animals are in pasture or are fed a good leguminous roughage such as clover or alfalfa. The reasons for this may be that the concentrated feeding-stuff does not contain the proper vitamins, sufficient of the proper mineral elements or the proper proteins. If on the other hand good alfalfa or clover and silage are fed as a roughage these deficiencies in the ration will be taken care of. *Grow good quality roughage! It will make the feeding-stuffs which you buy more valuable!*

#### REQUESTS FOR ANALYSIS OF FEEDS.

The Department is frequently asked to make analyses of samples of feeds for individuals. This they are always glad to do when the circumstances warrant it. It must be pointed out, however, that the privilege is sometimes abused. Many of these samples apparently represent only a handful of feed taken from one bag and are sent to the Department carelessly wrapped in paper or in a paste-board box from which much of the fine material may have been lost. The analysis of these samples requires the same expenditure of labor and materials as the analysis of an official sample; yet the figures obtained may be worse than worthless if the sample examined does not accurately represent the lot from which it was taken.

On account of the expense involved in making these analyses and also the possibility under present conditions of the figures obtained being unreliable the Department wishes to suggest; first, that in cases where the amount of

feed is less than one ton that instead of sending a sample for analysis that the consumer write us asking our findings on the last official samples of this feed which we have analyzed and second, that where the amount of feed is more than one ton that a sample be taken from at least ten per cent. of the bags in a manner that will insure its being accurately representative of the whole lot. In order that the analyses may be of value to the Department as well as to the individual we request that the following information on each sample be submitted: brand, manufacturer, address, guarantee: protein, fat, carbohydrates, moisture, ash, crude fiber, ingredients, dealer, address, number of bags in lot, number of bags sampled, price per 100 pounds, your name, address, your reason for requesting analysis.

#### SOME SUGGESTIONS IN PURCHASING FEEDS.

1. Compare the cost of feeds with their analysis even within the same class and buy the feeds which offer the greatest value for the dollar.

2. Beware of misleading brand names indicating unusual feeding value. Let the analysis rather than the brand name be your guide.

3. If you grow legumes or high protein crops for roughage you will need to buy less of the expensive protein feeds and the feeding-stuffs which you buy will have a higher feeding value.

4. A good feed is high in protein and fat or carbohydrates and low in crude fiber.

5. A poor feed is low in protein and fat and high in crude fiber.

6. If you buy a ready mixed feed be sure that it is of the proper analysis to meet your needs.

Acknowledgments are due to Mr. Michael Voyagis, who assisted in making the protein and ash determinations.
