# EQUIVALENCE OF DOMAINS ARISING FROM DUALITY OF ORBITS ON FLAG MANIFOLDS III 

TOSHIHIKO MATSUKI

#### Abstract

In Gindikin and Matsuki 2003, we defined a $G_{\mathbb{R}}-K_{\mathbb{C}}$ invariant subset $C(S)$ of $G_{\mathbb{C}}$ for each $K_{\mathbb{C}}$-orbit $S$ on every flag manifold $G_{\mathbb{C}} / P$ and conjectured that the connected component $C(S)_{0}$ of the identity would be equal to the Akhiezer-Gindikin domain $D$ if $S$ is of nonholomorphic type. This conjecture was proved for closed $S$ in Wolf and Zierau 2000 and 2003, Fels and Huckleberry 2005, and Matsuki 2006 and for open $S$ in Matsuki 2006. It was proved for the other orbits in Matsuki 2006, when $G_{\mathbb{R}}$ is of non-Hermitian type. In this paper, we prove the conjecture for an arbitrary non-closed $K_{\mathbb{C}}$ orbit when $G_{\mathbb{R}}$ is of Hermitian type. Thus the conjecture is completely solved affirmatively.

## 1. Introduction

Let $G_{\mathbb{C}}$ be a connected complex semisimple Lie group and $G_{\mathbb{R}}$ a connected real form of $G_{\mathbb{C}}$. Let $K_{\mathbb{C}}$ be the complexification in $G_{\mathbb{C}}$ of a maximal compact subgroup $K$ of $G_{\mathbb{R}}$. Let $X=G_{\mathbb{C}} / P$ be a flag manifold of $G_{\mathbb{C}}$, where $P$ is an arbitrary parabolic subgroup of $G_{\mathbb{C}}$. Then there exists a natural one-to-one correspondence between the set of $K_{\mathbb{C}}$-orbits $S$ and the set of $G_{\mathbb{R}^{-} \text {orbits }} S^{\prime}$ on $X$ given by the condition:

$$
\begin{equation*}
S \leftrightarrow S^{\prime} \Longleftrightarrow S \cap S^{\prime} \text { is non-empty and compact } \tag{1.1}
\end{equation*}
$$

([M2]). For each $K_{\mathbb{C}}$-orbit $S$ we defined in GM1 a subset $C(S)$ of $G_{\mathbb{C}}$ by

$$
C(S)=\left\{x \in G_{\mathbb{C}} \mid x S \cap S^{\prime} \text { is non-empty and compact }\right\}
$$

where $S^{\prime}$ is the $G_{\mathbb{R}^{-}}$-orbit on $X$ given by (1.1).
Akhiezer and Gindikin defined a domain $D / K_{\mathbb{C}}$ in $G_{\mathbb{C}} / K_{\mathbb{C}}$ as follows ( AG ). Let $\mathfrak{g}_{\mathbb{R}}=\mathfrak{k} \oplus \mathfrak{m}$ denote the Cartan decomposition of $\mathfrak{g}_{\mathbb{R}}=\operatorname{Lie}\left(G_{\mathbb{R}}\right)$ with respect to $K$. Let $\mathfrak{t}$ be a maximal abelian subspace in $i \mathrm{~m}$. Put

$$
\mathfrak{t}^{+}=\left\{Y \in \mathfrak{t}| | \alpha(Y) \left\lvert\,<\frac{\pi}{2}\right. \text { for all } \alpha \in \Sigma\right\}
$$

where $\Sigma$ is the restricted root system of $\mathfrak{g}_{\mathbb{C}}$ with respect to $\mathfrak{t}$. Then $D$ is defined by

$$
D=G_{\mathbb{R}}\left(\exp \mathfrak{t}^{+}\right) K_{\mathbb{C}} .
$$

We conjectured the following in GM1.
Conjecture 1.1 (Conjecture 1.6 in GM1]). Suppose that $X=G_{\mathbb{C}} / P$ is not $K_{\mathbb{C}^{-}}$ homogeneous. Then we will have $C(S)_{0}=D$ for all $K_{\mathbb{C}}$-orbits $S$ of non-holomorphic type on $X$. Here $C(S)_{0}$ is the connected component of $C(S)$ containing the identity.

[^0]Remark 1.2. When $G_{\mathbb{R}}$ is of Hermitian type, there exist two special closed $K_{\mathbb{C}^{-}}$ orbits $S_{1}=K_{\mathbb{C}} B / B=Q / B$ and $S_{2}=K_{\mathbb{C}} w_{0} B / B=\bar{Q} w_{0} / B$ on the full flag manifold $G_{\mathbb{C}} / B$, where $Q=K_{\mathbb{C}} B$ is the usual maximal parabolic subgroup of $G_{\mathbb{C}}$ defined by a nontrivial central element in $i k$ and $w_{0}$ is the longest element in the Weyl group. For each parabolic subgroup $P$ containing the Borel subgroup $B$, two closed $K_{\mathbb{C}}$-orbits $S_{1} P$ and $S_{2} P$ on $G_{\mathbb{C}} / P$ are called of holomorphic type and all the other $K_{\mathbb{C}}$-orbits are called of nonholomorphic type. Especially all the non-closed $K_{\mathbb{C}}$-orbits are defined to be of nonholomorphic type.

When $G_{\mathbb{R}}$ is of non-Hermitian type, we define that all the $K_{\mathbb{C}}$-orbits are of nonholomorphic type.

Let $S_{\text {op }}$ denote the unique open dense $K_{\mathbb{C}}-B$ double coset in $G_{\mathbb{C}}$. Then $S_{\text {op }}^{\prime}$ is the unique closed $G_{\mathbb{R}^{-}} B$ double coset in $G_{\mathbb{C}}$. In this case we see that

$$
C\left(S_{\mathrm{op}}\right)=\left\{x \in G_{\mathbb{C}} \mid x S_{\mathrm{op}} \supset S_{\mathrm{op}}^{\prime}\right\} .
$$

It follows easily that $C\left(S_{\mathrm{op}}\right)$ is a Stein manifold (cf. GM1], [H]). The connected component $C\left(S_{\mathrm{op}}\right)_{0}$ is often called the Iwasawa domain.

The inclusion

$$
D \subset C\left(S_{\mathrm{op}}\right)_{0}
$$

was proved in H]. (Later M3 gave a proof without complex analysis.) On the other hand, it was proved in GM1, Proposition 8.1 and Proposition 8.3, that $C\left(S_{\mathrm{op}}\right)_{0} \subset C(S)_{0}$ for all $K_{\mathbb{C}}-P$ double cosets $S$ for any $P$. So we have the inclusion

$$
\begin{equation*}
D \subset C(S)_{0} \tag{1.2}
\end{equation*}
$$

Hence we have only to prove the converse inclusion

$$
\begin{equation*}
C(S)_{0} \subset D \tag{1.3}
\end{equation*}
$$

for $K_{\mathbb{C}}$-orbits $S$ of nonholomorphic type in Conjecture 1.1.
If $S$ is closed in $G_{\mathbb{C}}$, then we can write

$$
C(S)=\left\{x \in G_{\mathbb{C}} \mid x S \subset S^{\prime}\right\}
$$

So the connected component $C(S)_{0}$ is essentially equal to the cycle space introduced in WW. For Hermitian cases the inclusion (1.3) for closed $S$ was proved in WZ2, and WZ3. For non-Hermitian cases it was proved in [FH] and M4.

When $S$ is the open $K_{\mathbb{C}^{-}} P$ double coset in $G_{\mathbb{C}}$, the inclusion (1.3) was proved in [M4] for an arbitrary $P$ generalizing the result in [B].

Recently the inclusion (1.3) was proved in M5] for an arbitrary orbit $S$ when $G_{\mathbb{R}}$ is of non-Hermitian type. So the remaining problem was to prove (1.3) for non-closed and non-open orbits when $G_{\mathbb{R}}$ is of Hermitian type.

In this paper we solve this problem.
In the next section we prove the following theorem.
Theorem 1.3. Suppose that $G_{\mathbb{R}}$ is of Hermitian type and let $S$ be a non-closed $K_{\mathbb{C}}-P$ double coset in $G_{\mathbb{C}}$. Then there exist $K_{\mathbb{C}}-B$ double cosets $\widetilde{S}_{1}$ and $\widetilde{S}_{2}$ contained in the boundary $\partial S=S^{c l}-S$ of $S$ such that

$$
x\left(\widetilde{S}_{1} \cup \widetilde{S}_{2}\right)^{c l} \cap S_{0}^{\prime c l} \neq \phi
$$

for all the elements $x$ in the boundary of $D$. Here $S_{0}$ denotes the dense $K_{\mathbb{C}}-B$ double coset in $S$.

Remark 1.4. It seems that $\widetilde{S_{1}}$ and $\widetilde{S_{2}}$ are always distinct $K_{\mathbb{C}}$-orbits. But we do not need this distinctness.

Corollary 1.5. Suppose that $G_{\mathbb{R}}$ is of Hermitian type and let $S$ be a non-closed $K_{\mathbb{C}}-P$ double coset in $G_{\mathbb{C}}$. Then $C(S)_{0}=D$.
Proof. Let $S_{0}$ be as in Theorem 1.3. Let $\Psi$ denote the set of the simple roots in the positive root system for $B$. For each $\alpha \in \Psi$ we define a parabolic subgroup

$$
P_{\alpha}=B \sqcup B w_{\alpha} B
$$

of $G_{\mathbb{C}}$. By GM2], Lemma 2, we can take a sequence $\left\{\alpha_{1}, \ldots, \alpha_{m}\right\}$ of simple roots such that

$$
\operatorname{dim}_{\mathbb{C}} S_{0} P_{\alpha_{1}} \cdots P_{\alpha_{k}}=\operatorname{dim}_{\mathbb{C}} S_{0}+k
$$

for $k=0, \ldots, m=\operatorname{codim}_{\mathbb{C}} S_{0}$. Then it is shown in [M5], Theorem 1.4, that

$$
\begin{equation*}
x \in C(S) \cap D^{c l} \Longrightarrow x S^{c l} \cap S_{\mathrm{op}}^{\prime} P_{\alpha_{m}} \cdots P_{\alpha_{1}}=x S \cap S_{0}^{\prime} \tag{1.4}
\end{equation*}
$$

Let $x$ be an element in the boundary of $D$. Then it follows from Theorem 1.3 that

$$
x(\partial S) \cap S_{0}^{\prime c l} \neq \phi
$$

If $x$ is also contained in $C(S)$, then it follows from (1.4) that

$$
x(\partial S) \cap S_{\mathrm{op}}^{\prime} P_{\alpha_{m}} \cdots P_{\alpha_{1}}=\phi
$$

Since ${S_{0}^{\prime c l}}^{c l}$ is contained in the closed set $S_{\mathrm{op}}^{\prime} P_{\alpha_{m}} \cdots P_{\alpha_{1}}$, we have

$$
x(\partial S) \cap S_{0}^{\prime c l}=\phi
$$

a contradiction. Hence $x \notin C(S)$. Thus we have proved $C(S)_{0} \subset D$.
Section 3 is devoted to the explicit computation of the case where $G_{\mathbb{R}}=S p(2, \mathbb{R})$. We use Proposition 3.2 in the proof of Lemma 2.4 in Section 2. Another simple example of the $S U(2,1)$-case is explicitly computed in M4] Example 1.5.

## 2. Proof of Theorem 1.3

Let $\mathfrak{j}$ be a maximal abelian subspace of $i \mathfrak{k}$. Let $\Delta$ denote the root system of the pair $\left(\mathfrak{g}_{\mathbb{C}}, \mathfrak{j}\right)$. Since $G_{\mathbb{R}}$ is a group of Hermitian type, there exists a nontrivial central element $Z$ of $i \mathfrak{k}$ and we can write

$$
\mathfrak{g}_{\mathbb{C}}=\mathfrak{k}_{\mathbb{C}} \oplus \mathfrak{n} \oplus \overline{\mathfrak{n}}
$$

where $\Delta_{n}^{+}=\{\alpha \in \Delta \mid \alpha(Z)>0\}, \mathfrak{n}=\bigoplus_{\alpha \in \Delta_{n}^{+}} \mathfrak{g}_{\mathbb{C}}(\mathfrak{j}, \alpha)$ and $* \mapsto \overline{\text { denotes the }}$ conjugation in $\mathfrak{g}_{\mathbb{C}}$ with respect to $\mathfrak{g}_{\mathbb{R}}$. Let $Q$ be the maximal parabolic subgroup of $G_{\mathbb{C}}$ defined by $Q=K_{\mathbb{C}} \exp \mathfrak{n}$. Let $\Delta^{+}$be a positive system of $\Delta$ containing $\Delta_{n}^{+}$. Then it defines a Borel subgroup $B=B\left(\mathfrak{j}, \Delta^{+}\right)$of $G_{\mathbb{C}}$ contained in $Q$.

Let $P$ be a parabolic subgroup of $G_{\mathbb{C}}$ containing $B$. Let $S$ be a non-closed $K_{\mathbb{C}}-P$ double coset in $G_{\mathbb{C}}$ and let $S_{0}$ denote the dense $K_{\mathbb{C}^{-}} B$ double coset in $S$. By [M1], Theorem 2, we can write

$$
S_{0}=K_{\mathbb{C}} c_{\gamma_{1}} \cdots c_{\gamma_{k}} w B
$$

with some $w \in W$ and a strongly orthogonal system $\left\{\gamma_{1}, \ldots, \gamma_{k}\right\}$ of roots in $\Delta_{n}^{+}$. Here $W$ is the Weyl group of $\Delta$ and

$$
c_{\gamma_{j}}=\exp (X-\bar{X})
$$

with some $X \in \mathfrak{g}_{\mathbb{C}}\left(\mathfrak{j}, \gamma_{j}\right)$ such that $c_{\gamma_{j}}^{2}$ is the reflection with respect to $\gamma_{j}$.

Let $\Theta$ denote the subset of $\Psi$ such that $P=B W_{\Theta} B$ where $W_{\Theta}$ is the subgroup of $W$ generated by $\left\{w_{\alpha} \mid \alpha \in \Theta\right\}$. Let $\Delta_{\Theta}$ denote the subset of $\Delta$ defined by

$$
\Delta_{\Theta}=\left\{\beta \in \Delta \mid \beta=\sum_{\alpha \in \Theta} n_{\alpha} \alpha \text { for some } n_{\alpha} \in \mathbb{Z}\right\}
$$

If $\gamma_{j} \in w \Delta_{\Theta}$ for all $j=1, \ldots, k$, then it follows that $c_{\gamma_{j}} \in w P w^{-1}$ for all $j=1, \ldots, k$ and therefore

$$
S w^{-1}=S_{0} P w^{-1}=K_{\mathbb{C}} c_{\gamma_{1}} \cdots c_{\gamma_{k}} w P w^{-1}=K_{\mathbb{C}} w P w^{-1}
$$

becomes closed in $G_{\mathbb{C}}$, contradicting the assumption. Hence there exists a $j$ such that $\gamma_{j} \notin w \Delta_{\Theta}$. Replacing the order of $\gamma_{1}, \ldots, \gamma_{k}$, we may assume that

$$
\gamma_{1} \notin w \Delta_{\Theta}
$$

Let $\mathfrak{l}$ denote the complex Lie subalgebra of $\mathfrak{g}_{\mathbb{C}}$ generated by $\mathfrak{g}_{\mathbb{C}}\left(\mathfrak{j}, \gamma_{1}\right) \oplus_{\mathfrak{C}}^{\mathbb{C}}\left(\mathfrak{j},-\gamma_{1}\right)$ which is isomorphic to $\mathfrak{s l}(2, \mathbb{C})$ and let $L$ be the analytic subgroup of $G_{\mathbb{C}}$ for $\mathfrak{l}$. Then we have $\left(L \cap K_{\mathbb{C}}\right) c_{\gamma_{1}}\left(L \cap w B w^{-1}\right)=\left(L \cap K_{\mathbb{C}}\right) c_{\gamma_{1}}^{-1}\left(L \cap w B w^{-1}\right)$ since both of the double cosets are open dense in $L$. Hence we have

$$
S_{0}=K_{\mathbb{C}} c_{\gamma_{1}} \cdots c_{\gamma_{k}} w B=K_{\mathbb{C}} c_{\gamma_{1}}^{-1} c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B=K_{\mathbb{C}} c_{\gamma_{1}} \cdots c_{\gamma_{k}} w_{\gamma_{1}} w B
$$

If $\gamma_{1} \notin w \Delta^{+}$, then $\gamma_{1} \in w_{\gamma_{1}} w \Delta^{+}$. So we may assume

$$
\gamma_{1} \in w \Delta^{+}
$$

replacing $w$ with $w_{\gamma_{1}} w$ if necessary. Let $\ell$ denote the real rank of $G_{\mathbb{R}}$.
Lemma 2.1. There exists a maximal strongly orthgonal system $\left\{\beta_{1}, \ldots, \beta_{\ell}\right\}$ of roots in $\Delta_{n}^{+}$satisfying the following conditions:
(i) If $\gamma_{1}$ is a long root of $\Delta$, then $\beta_{1}=\gamma_{1}$ and $\gamma_{2}, \ldots, \gamma_{k} \in \mathbb{R} \beta_{2} \oplus \cdots \oplus \mathbb{R} \beta_{\ell}$. (If the roots in $\Delta$ have the same length, then we define that all the roots are long roots.)
(ii) If $\gamma_{1}$ is a short root of $\Delta$, then $\gamma_{1} \in \mathbb{R} \beta_{1} \oplus \mathbb{R} \beta_{2}$ and $\gamma_{2}, \ldots, \gamma_{k} \in \mathbb{R} \beta_{3} \oplus \cdots \oplus$ $\mathbb{R} \beta_{\ell}$.

Proof. First suppose that $\mathfrak{g}_{\mathbb{R}}$ is of type AIII, DIII, EIII, EVII or DI (of real rank $2)$. Then the roots in $\Delta$ have the same length. So we have only to take $\beta_{j}=\gamma_{j}$ for $j=1, \ldots, k$ and choose an orthogonal system $\left\{\beta_{1}, \ldots, \beta_{\ell}\right\}$ of roots in $\Delta_{n}^{+}$containing $\left\{\beta_{1}, \ldots, \beta_{k}\right\}$.

Next suppose that $\mathfrak{g}_{\mathbb{R}} \cong \mathfrak{s p}(\ell, \mathbb{R})$. Write

$$
\Delta=\left\{ \pm e_{r} \pm e_{s} \mid 1 \leq r<s \leq \ell\right\} \sqcup\left\{ \pm 2 e_{r} \mid 1 \leq r \leq \ell\right\}
$$

and

$$
\Delta_{n}^{+}=\left\{e_{r}+e_{s} \mid 1 \leq r<s \leq \ell\right\} \sqcup\left\{2 e_{r} \mid 1 \leq r \leq \ell\right\}
$$

as usual using an orthonormal basis $\left\{e_{1}, \ldots, e_{\ell}\right\}$ of $\mathfrak{j}^{*}$. If $\gamma_{1}=2 e_{r}$, then $\left\{\beta_{2}, \ldots, \beta_{\ell}\right\}$ $=\left\{2 e_{s} \mid s \neq r\right\}$ satisfies condition (i). If $\gamma_{1}=e_{r}+e_{s}$ with $r \neq s$, then we put $\beta_{1}=$ $2 e_{r}$ and $\beta_{2}=2 e_{s}$. Assertion (ii) is clear if we put $\left\{\beta_{3}, \ldots, \beta_{\ell}\right\}=\left\{2 e_{p} \mid p \neq r, s\right\}$.

Finally suppose that $\mathfrak{g}_{\mathbb{R}}=\mathfrak{s o}(2,2 p-1)$ with $p \geq 2$. Then the real rank of $\mathfrak{g}_{\mathbb{R}}$ is two, and we can write

$$
\Delta=\left\{ \pm e_{r} \pm e_{s} \mid 1 \leq r<s \leq p\right\} \sqcup\left\{ \pm e_{r} \mid 1 \leq r \leq p\right\}
$$

and

$$
\Delta_{n}^{+}=\left\{e_{1} \pm e_{s} \mid 2 \leq s \leq p\right\} \sqcup\left\{e_{1}\right\}
$$

with an orthonormal basis $\left\{e_{1}, \ldots, e_{p}\right\}$ of $\mathfrak{j}^{*}$. If $k=2$, then we have $\gamma_{1}=\beta_{1}=e_{1} \pm e_{s}$ and $\gamma_{2}=\beta_{2}=e_{1} \mp e_{s}$ with some $s$. If $k=1$ and $\gamma_{1}=e_{1} \pm e_{s}$, then $\beta_{1}=\gamma_{1}$ and $\beta_{2}=e_{1} \mp e_{s}$. If $k=1$ and $\gamma_{1}=e_{1}$, then we may put $\beta_{1}=e_{1}+e_{2}$ and $\beta_{2}=e_{1}-e_{2}$.

Definition 2.2. (i) Define a subroot system $\Delta_{1}$ of $\Delta$ as follows.
If $\gamma_{1}$ is a long root of $\Delta$, then we put

$$
\Delta_{1}=\left\{ \pm \beta_{1}\right\}=\left\{ \pm \gamma_{1}\right\}
$$

On the other hand if $\gamma_{1}$ is a short root of $\Delta$, then we put

$$
\Delta_{1}=\Delta \cap\left(\mathbb{R} \beta_{1} \oplus \mathbb{R} \beta_{2}\right)
$$

(which is of type $\mathrm{C}_{2}$ ).
(ii) Put $\Delta_{2}=\left\{\alpha \in \Delta \mid \alpha\right.$ is orthogonal to $\left.\Delta_{1}\right\}$.
(iii) Let $\mathfrak{l}_{j}$ denote the complex Lie subalgebras of $\mathfrak{g}_{\mathbb{C}}$ generated by $\bigoplus_{\alpha \in \Delta_{j}} \mathfrak{g}_{\mathbb{C}}(\mathfrak{j}, \alpha)$ for $j=1,2$.
(iv) Let $L_{1}$ and $L_{2}$ denote the analytic subgroups of $G_{\mathbb{C}}$ for $\mathfrak{l}_{1}$ and $\mathfrak{l}_{2}$, respectively.

It follows from Lemma 2.1 that

$$
c_{\gamma_{1}} \in L_{1} \quad \text { and that } \quad c_{\gamma_{2}} \cdots c_{\gamma_{k}} \in L_{2} .
$$

Let $X_{j}$ be nonzero root vectors in $\mathfrak{g}_{\mathbb{C}}\left(\mathfrak{j}, \beta_{j}\right)$ for $j=1, \ldots, \ell$. Then we can define a maximal abelian subspace

$$
\mathfrak{t}=\mathbb{R}\left(X_{1}-\overline{X_{1}}\right) \oplus \cdots \oplus \mathbb{R}\left(X_{\ell}-\overline{X_{\ell}}\right)
$$

in $i \mathfrak{m}$ and a maximal abelian subspace

$$
\mathfrak{a}=\mathbb{R}\left(X_{1}+\overline{X_{1}}\right) \oplus \cdots \oplus \mathbb{R}\left(X_{\ell}+\overline{X_{\ell}}\right)
$$

in $\mathfrak{m}$ as in GM1, Section 2. Since the restricted root system $\Sigma(\mathfrak{t})$ is of type $\mathrm{BC}_{\ell}$ or $\mathrm{C}_{\ell}$, the set $\mathfrak{t}^{+}$is defined by the long roots in $\Sigma(\mathfrak{t})$. Hence it is of the form

$$
\mathfrak{t}^{+}=\left\{Y_{1}+\cdots+Y_{\ell} \mid Y_{j} \in \mathfrak{t}_{j}^{+}\right\}
$$

where $\mathfrak{t}_{j}^{+}=\left\{s\left(X_{j}-\overline{X_{j}}\right) \mid-(\pi / 4)<s<\pi / 4\right\}$ by a suitable normalization of $X_{j}$ for $j=1, \ldots, \ell$.

Put $T^{+}=\exp \mathfrak{t}^{+}$and $A=\exp \mathfrak{a}$. Then it is shown in GM1, Lemma 2.1, that $A Q=T^{+} Q$ and hence that

$$
G_{\mathbb{R}} Q=K A Q=K T^{+} Q
$$

by the Cartan decomposition $G_{\mathbb{R}}=K A K$. The closure of $G_{\mathbb{R}} Q$ in $G_{\mathbb{C}}$ is written as

$$
\left(G_{\mathbb{R}} Q\right)^{c l}=G_{\mathbb{R}} Q \sqcup G_{\mathbb{R}} c_{\beta_{1}} Q \sqcup G_{\mathbb{R}} c_{\beta_{1}} c_{\beta_{2}} Q \sqcup \cdots \sqcup G_{\mathbb{R}} c_{\beta_{1}} \cdots c_{\beta_{\ell}} Q
$$

where $c_{\beta_{j}}=\exp (\pi / 4)\left(X_{j}-\overline{X_{j}}\right)$ for $j=1, \ldots, \ell([\overline{\mathrm{WZ1}}]$, Theorem 3.8). We also see that

$$
\begin{equation*}
G_{\mathbb{R}} c_{\beta_{1}} \cdots c_{\beta_{k}} Q=K c_{\beta_{1}} \cdots c_{\beta_{k}} T_{k+1}^{+} \cdots T_{\ell}^{+} Q \tag{2.1}
\end{equation*}
$$

where $T_{j}^{+}=\exp \mathfrak{t}_{j}^{+}$since we can consider the action of the Weyl group $W_{K}(T)$ on $T$ which is of type $\mathrm{BC}_{\ell}$.

By the map

$$
\iota: x K_{\mathbb{C}} \mapsto(x Q, x \bar{Q})
$$

the complex symmetric space $G_{\mathbb{C}} / K_{\mathbb{C}}$ is embedded in $G_{\mathbb{C}} / Q \times G_{\mathbb{C}} / \bar{Q}([\mathbf{W Z 2}])$. It is shown in $\overline{\mathrm{BHH}}$, Section 3, and GM1, Proposition 2.2, that

$$
\iota\left(D / K_{\mathbb{C}}\right)=G_{\mathbb{R}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}
$$

Lemma 2.3. Suppose that

$$
\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} c_{\beta_{1}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}
$$

and that $\gamma_{1}$ is a long root of $\Delta_{n}^{+}$. (If the roots in $\Delta$ have the same length, then we define that all the roots are long roots.) Define a $K_{\mathbb{C}}-B$ double coset $\widetilde{S}_{1}$ by

$$
\widetilde{S}_{1}=K_{\mathbb{C}} c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B
$$

Then $\widetilde{S}_{1}$ is contained in $\partial S=S^{c l}-S$ and

$$
x \widetilde{S}_{1} \cap S_{0}^{\prime} \neq \phi
$$

Proof. It is clear that we may replace $x$ by any elements in the double coset $G_{\mathbb{R}} x K_{\mathbb{C}}$. By the left $G_{\mathbb{R}}$-action we may assume that $x \in \bar{Q}$. By the right $K_{\mathbb{C}}$-action we may moreover assume that $x \in \bar{N}$ since $\bar{Q}=\bar{N} K_{\mathbb{C}}$. Since $K=K_{\mathbb{C}} \cap G_{\mathbb{R}}$ normalizes $\bar{N}$, we may assume by (2.1) that

$$
x Q=c_{\beta_{1}} t_{2} \cdots t_{\ell} Q
$$

with some $t_{j} \in T_{j}^{+}$for $j=2, \ldots, \ell$. As in WZ2, we write

$$
c_{\beta_{1}}=c_{\gamma_{1}}=c=c^{-} c^{+} \quad \text { and } \quad t_{j}=t_{j}^{-} t_{j}^{+} \text {for } j=2, \ldots, \ell
$$

with $c^{-}, t_{j}^{-} \in \bar{N}$ and $c^{+}, t_{j}^{+} \in Q$. Then we have

$$
x=c^{-} t_{2}^{-} \cdots t_{\ell}^{-}
$$

It follows from Lemma 2.1 and Definition 2.2 that $c_{\gamma_{2}} \cdots c_{\gamma_{k}} \in L_{2}$. Since $\operatorname{Ad}\left(c_{\gamma_{2}} \cdots c_{\gamma_{k}}\right) \mathrm{j}$ is $\theta$-stable, the double cosets

$$
S_{L_{2}}=\left(L_{2} \cap K_{\mathbb{C}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right)
$$

and

$$
S_{L_{2}}^{\prime}=\left(L_{2} \cap G_{\mathbb{R}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right)
$$

correspond by the duality (M1, Theorem 2).
It follows from Lemma 2.1 (i) and Definition 2.2 that

$$
c^{ \pm} \in L_{1} \quad \text { and } \quad t_{2}^{ \pm}, \ldots, t_{\ell}^{ \pm} \in L_{2}
$$

It follows moreover from Definition 2.2 (i) that $\mathfrak{l}_{1} \cong \mathfrak{s l}(2, \mathbb{C})$.
Write $y=t_{2}^{-} \cdots t_{\ell}^{-}$. Then we have

$$
y Q=t_{2} \cdots t_{\ell} Q \subset T^{+} Q \subset G_{\mathbb{R}} Q
$$

and

$$
y \bar{Q}=\bar{Q} \subset G_{\mathbb{R}} \bar{Q}
$$

Hence we have

$$
y \in L_{2} \cap\left(C\left(S_{1}\right) \cap C\left(S_{2}\right)\right)=L_{2} \cap D
$$

by GM1, (1.3). By the inclusion (1.2) this implies that the set $y S_{L_{2}} \cap S_{L_{2}}^{\prime}$ is nonempty and closed in $L_{2}$. Take an element $z$ of $y S_{L_{2}} \cap S_{L_{2}}^{\prime}$.

Since $\gamma_{1} \in w \Delta^{+}$, we have $c^{+} \in w B w^{-1}$. Since $c^{+} \in L_{1}$ commutes with elements in $L_{2}$, we have

$$
\begin{aligned}
c z \in c y S_{L_{2}} & =c^{-} c^{+} y\left(L_{2} \cap K_{\mathbb{C}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right) \\
& =c^{-} y\left(L_{2} \cap K_{\mathbb{C}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}} c^{+}\left(L_{2} \cap w B w^{-1}\right) \\
& \subset c^{-} y K_{\mathbb{C}} c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B w^{-1}=x \widetilde{S}_{1} w^{-1}
\end{aligned}
$$

On the other hand we have

$$
\begin{aligned}
c z \in c S_{L_{2}}^{\prime} & =c\left(L_{2} \cap G_{\mathbb{R}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right) \\
& =\left(L_{2} \cap G_{\mathbb{R}}\right) c_{\gamma_{1}} c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right) \subset S_{0}^{\prime} w^{-1}
\end{aligned}
$$

Hence $x \widetilde{S}_{1} \cap S_{0}^{\prime} \neq \phi$. It is clear that $\widetilde{S}_{1} \subset S_{0}^{c l}=S^{c l}$ because

$$
\left(L_{1} \cap K_{\mathbb{C}}\right)\left(L_{1} \cap w B w^{-1}\right) \subset\left(\left(L_{1} \cap K_{\mathbb{C}}\right) c\left(L_{1} \cap w B w^{-1}\right)\right)^{c l}=L_{1}
$$

Now we will prove $\widetilde{S}_{1} \not \subset S$. Consider the map

$$
\varphi: K_{\mathbb{C}} \backslash G_{\mathbb{C}} / B \ni K_{\mathbb{C}} g B \mapsto B \theta(g)^{-1} g B \in B \backslash G_{\mathbb{C}} / B
$$

introduced in Sp where $\theta$ is the holomorphic involution in $G_{\mathbb{C}}$ defining $K_{\mathbb{C}}$. We have

$$
\varphi\left(\widetilde{S}_{1}\right)=B w^{-1} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w B
$$

and

$$
\varphi(S)=\varphi\left(S_{0} P\right) \subset P w^{-1} w_{\gamma_{1}} \cdots w_{\gamma_{k}} w P=B W_{\Theta} w^{-1} w_{\gamma_{1}} \cdots w_{\gamma_{k}} w W_{\Theta} B
$$

So we have only to show

$$
\begin{equation*}
w^{-1} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w \notin W_{\Theta} w^{-1} w_{\gamma_{1}} \cdots w_{\gamma_{k}} w W_{\Theta} \tag{2.2}
\end{equation*}
$$

Let $Z$ be an element in $\mathfrak{j}$ defining $P$. This implies that $Z$ is dominant for $\Delta^{+}$and that $\{\alpha \in \Psi \mid \alpha(Z)=0\}=\Theta$. Let $w_{1}$ and $w_{2}$ be elements in $W_{\Theta}$. Let $B($, denote the Killing form on $\mathfrak{g}$ and let $Y_{\gamma_{1}}$ denote the element in $\mathfrak{j}$ such that

$$
\gamma_{1}(Y)=B\left(Y, Y_{\gamma_{1}}\right) \quad \text { for all } Y \in \mathfrak{j}
$$

Then we have

$$
\begin{aligned}
& B\left(Z, w^{-1} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right)-B\left(Z, w_{1} w^{-1} w_{\gamma_{1}} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w w_{2} Z\right) \\
= & B\left(w Z-w_{\gamma_{1}} w Z, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right) \\
= & \frac{2 B\left(Y_{\gamma_{1}}, w Z\right)}{B\left(Y_{\gamma_{1}}, Y_{\gamma_{1}}\right)} B\left(Y_{\gamma_{1}}, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right) \\
= & \frac{2 B\left(Y_{\gamma_{1}}, w Z\right)^{2}}{B\left(Y_{\gamma_{1}}, Y_{\gamma_{1}}\right)}>0
\end{aligned}
$$

since $\gamma_{1} \notin w \Delta_{\Theta}$. Thus we have proved (2.2).
Lemma 2.4. Suppose that

$$
\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} c_{\beta_{1}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}
$$

and that $\gamma_{1}$ is a short root of $\Delta_{n}^{+}$. (We assume that $\mathfrak{g}_{\mathbb{R}} \cong \mathfrak{s p}(\ell, \mathbb{R})$ or $\mathfrak{s o}(2,2 p-1)$ with $p \geq 2$.) Define a $K_{\mathbb{C}}-B$ double coset $\widetilde{S}_{1}$ by $\widetilde{S}_{1}=K_{\mathbb{C}} g c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B$ where

$$
g= \begin{cases}e & \text { if } \gamma_{1} \text { is the simple short root of } \Delta_{1}^{+} \\ c_{\beta} & \text { if } \gamma_{1} \text { is the non-simple short root of } \Delta_{1}^{+}\end{cases}
$$

Here $\Delta_{1}^{+}=\Delta_{1} \cap w \Delta^{+}$and $\beta$ is the long simple root of $\Delta_{1}^{+}$. Then $\widetilde{S}_{1}$ is contained in $\partial S=S^{c l}-S$ and

$$
x \widetilde{S}_{1} \cap S_{0}^{\prime c l} \neq \phi
$$

Proof. It follows from Lemma 2.1 (ii) and Definition 2.2 that

$$
c_{\beta_{1}}^{ \pm}, t_{2}^{ \pm} \in L_{1} \quad \text { and } \quad t_{3}^{ \pm}, \ldots, t_{\ell}^{ \pm} \in L_{2}
$$

It follows moreover from Definition 2.2 (i) that $\mathfrak{l}_{1} \cong \mathfrak{s p}(2, \mathbb{C})$.
Write $y=t_{3}^{-} \cdots t_{\ell}^{-}$. Then by the same argument as in the proof of Lemma 2.3 we see that the set $y S_{L_{2}} \cap S_{L_{2}}^{\prime}$ is nonempty and closed in $L_{2}$. Take an element $z$ of $y S_{L_{2}} \cap S_{L_{2}}^{\prime}$.

The positive system $\Delta_{1}^{+}$of $\Delta_{1}$ consists of two long roots and two short roots. Since $\gamma_{1} \in \Delta_{1}^{+}, \gamma_{1}$ is either of these two short roots. Write $x_{1}=c_{\beta_{1}}^{-} t_{2}^{-}$.

First assume that $\gamma_{1}$ is the simple short root of $\Delta_{1}^{+}$. Then it follows from Proposition 3.2 (i) in the next section that

$$
\begin{equation*}
x_{1}\left(L_{1} \cap K_{\mathbb{C}}\right)\left(L_{1} \cap w B w^{-1}\right) \cap\left(\left(L_{1} \cap G_{\mathbb{R}}\right) c_{\gamma_{1}}\left(L_{1} \cap w B w^{-1}\right)\right)^{c l} \tag{2.3}
\end{equation*}
$$

is nonempty. Note that $L_{1} \cap w B w^{-1}$ and $\gamma_{1}$ correspond to $w_{\beta_{2}} B w_{\beta_{2}}^{-1}$ and $\delta$ in the next section, respectively. Let $z_{1}$ be an element of (2.3). Then we have

$$
\begin{aligned}
z_{1} z & \in x_{1}\left(L_{1} \cap K_{\mathbb{C}}\right)\left(L_{1} \cap w B w^{-1}\right) y S_{L_{2}} \\
& =x_{1}\left(L_{1} \cap K_{\mathbb{C}}\right)\left(L_{1} \cap w B w^{-1}\right) y\left(L_{2} \cap K_{\mathbb{C}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right) \\
& =x_{1} y\left(L_{1} \cap K_{\mathbb{C}}\right)\left(L_{2} \cap K_{\mathbb{C}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{1} \cap w B w^{-1}\right)\left(L_{2} \cap w B w^{-1}\right) \\
& \subset x K_{\mathbb{C}} c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B w^{-1}=x \widetilde{S}_{1} w^{-1}
\end{aligned}
$$

and

$$
\begin{aligned}
z_{1} z & \in\left(\left(L_{1} \cap G_{\mathbb{R}}\right) c_{\gamma_{1}}\left(L_{1} \cap w B w^{-1}\right)\right)^{c l} S_{L_{2}}^{\prime} \\
& =\left(\left(L_{1} \cap G_{\mathbb{R}}\right) c_{\gamma_{1}}\left(L_{1} \cap w B w^{-1}\right)\right)^{c l}\left(L_{2} \cap G_{\mathbb{R}}\right) c_{\gamma_{2}} \cdots c_{\gamma_{k}}\left(L_{2} \cap w B w^{-1}\right) \\
& \subset\left(G_{\mathbb{R}} c_{\gamma_{1}} c_{\gamma_{2}} \cdots c_{\gamma_{k}} w B w^{-1}\right)^{c l}=S_{0}^{\prime c l} w^{-1} .
\end{aligned}
$$

So we have $x \widetilde{S}_{1} \cap S_{0}^{\prime c l} \neq \phi$. We can prove $\widetilde{S}_{1} \subset S^{c l}-S$ by the same arguments as in the proof of Lemma 2.3.

Next assume that $\gamma_{1}$ is the non-simple short root of $\Delta_{1}^{+}$. Then it follows from Proposition 3.2 (ii) in the next section that

$$
x_{1}\left(L_{1} \cap K_{\mathbb{C}}\right) c_{\beta}\left(L_{1} \cap w B w^{-1}\right) \cap\left(\left(L_{1} \cap G_{\mathbb{R}}\right) c_{\gamma_{1}}\left(L_{1} \cap w B w^{-1}\right)\right)^{c l}
$$

is nonempty. Note that $L_{1} \cap w B w^{-1}, \gamma_{1}$ and $\beta$ correspond to $B, \delta$ and $\beta_{2}$ in the next section, respectively. By the same argument as above we can prove

$$
x \widetilde{S}_{1} \cap S_{0}^{\prime c l} \neq \phi
$$

It follows from Remark 3.3 that $\widetilde{S}_{1} \subset S^{c l}$. Finally we will prove that $\widetilde{S}_{1} \not \subset S$. Using the same argument as in the proof of Lemma 2.3, we have only to show

$$
\begin{equation*}
w^{-1} w_{\beta} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w \notin W_{\Theta} w^{-1} w_{\gamma_{1}} \cdots w_{\gamma_{k}} w W_{\Theta} \tag{2.4}
\end{equation*}
$$

Let $Z$ and $Y_{\gamma_{1}}$ be as in the proof of Lemma 2.3. Define $Y_{\beta} \in \mathfrak{j}$ so that

$$
\beta(Y)=B\left(Y, Y_{\beta}\right) \quad \text { for all } Y \in \mathfrak{j}
$$

Then we have

$$
\begin{aligned}
& B\left(Z, w^{-1} w_{\beta} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right)-B\left(Z, w_{1} w^{-1} w_{\gamma_{1}} w_{\gamma_{2}} \cdots w_{\gamma_{k}} w w_{2} Z\right) \\
= & B\left(w_{\beta} w Z-w_{\gamma_{1}} w Z, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right) \\
= & B\left(w Z-w_{\gamma_{1}} w Z, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right)-B\left(w Z-w_{\beta} w Z, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right) \\
= & \frac{2 B\left(Y_{\gamma_{1}}, w Z\right)}{B\left(Y_{\gamma_{1}}, Y_{\gamma_{1}}\right)} B\left(Y_{\gamma_{1}}, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right)-\frac{2 B\left(Y_{\beta}, w Z\right)}{B\left(Y_{\beta}, Y_{\beta}\right)} B\left(Y_{\beta}, w_{\gamma_{2}} \cdots w_{\gamma_{k}} w Z\right) \\
= & \frac{2 B\left(Y_{\gamma_{1}}, w Z\right)^{2}}{B\left(Y_{\gamma_{1}}, Y_{\gamma_{1}}\right)}-\frac{2 B\left(Y_{\beta}, w Z\right)^{2}}{B\left(Y_{\beta}, Y_{\beta}\right)}>0
\end{aligned}
$$

for $w_{1}, w_{2} \in W_{\Theta}$ since
$B\left(Y_{\gamma_{1}}, w Z\right)>0, \quad 0 \leq B\left(Y_{\beta}, w Z\right) \leq B\left(Y_{\gamma_{1}}, w Z\right) \quad$ and $\quad B\left(Y_{\beta}, Y_{\beta}\right)=2 B\left(Y_{\gamma_{1}}, Y_{\gamma_{1}}\right)$.
Thus we have proved (2.4).
Using the conjugation on $G_{\mathbb{C}}$ with respect to the real form $G_{\mathbb{R}}$, the following follows from Lemma 2.3 and Lemma 2.4.

Corollary 2.5. Suppose that

$$
\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} Q / Q \times G_{\mathbb{R}} \overline{c_{\beta_{1}}} \bar{Q} / \bar{Q}
$$

Then there exists a $K_{\mathbb{C}}-B$ double coset $\widetilde{S}_{2}$ contained in $\partial S$ such that

$$
x \widetilde{S}_{2} \cap S_{0}^{\prime c l} \neq \phi
$$

Proof of Theorem 1.3. Let $S$ be a non-closed $K_{\mathbb{C}}-P$ double coset in $G_{\mathbb{C}}$. Then it follows from Lemma 2.3, Lemma 2.4 and Corollary 2.5 that there exist $K_{\mathbb{C}}-B$ double cosets $\widetilde{S}_{1}$ and $\widetilde{S}_{2}$ contained in $\partial S$ such that

$$
\begin{equation*}
x\left(\widetilde{S}_{1} \cup \widetilde{S}_{2}\right) \cap S_{0}^{\prime c l} \neq \phi \tag{2.5}
\end{equation*}
$$

for all $x \in \partial D$ satisfying

$$
\begin{equation*}
x K_{\mathbb{C}} \in \iota^{-1}\left(\left(G_{\mathbb{R}} c_{\beta_{1}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}\right) \sqcup\left(G_{\mathbb{R}} Q / Q \times G_{\mathbb{R}} \overline{c_{\beta_{1}}} \bar{Q} / \bar{Q}\right)\right) \tag{2.6}
\end{equation*}
$$

Suppose that

$$
y\left(\widetilde{S}_{1} \cup \widetilde{S}_{2}\right)^{c l} \cap S_{0}^{\prime c l}=\phi
$$

for some $y \in \partial D$. Then there exists a neighborhood $U$ of $y$ in $G_{\mathbb{C}}$ such that

$$
x\left(\widetilde{S}_{1} \cup \widetilde{S}_{2}\right)^{c l} \cap S_{0}^{\prime c l}=\phi
$$

for all $x \in U$. But this contradicts (2.5) because the right hand side of (2.6) is dense in $\partial\left(D / K_{\mathbb{C}}\right)$.

$$
\text { 3. } S p(2, \mathbb{R}) \text {-CASE }
$$

Let $G_{\mathbb{C}}=\operatorname{Sp}(2, \mathbb{C})=\left\{g \in G L(4, \mathbb{C}) \mid{ }^{t} g J g=J\right\}$ where

$$
J=\left(\begin{array}{cc}
0 & -I_{2} \\
I_{2} & 0
\end{array}\right)
$$

Let

$$
K_{\mathbb{C}}=\left\{\left.\left(\begin{array}{cc}
g & 0 \\
0 & { }^{t} g^{-1}
\end{array}\right) \right\rvert\, g \in G L(2, \mathbb{C})\right\} \quad \text { and } \quad G_{\mathbb{R}}=G_{\mathbb{C}} \cap U(2,2) \cong S p(2, \mathbb{R})
$$

Put $U_{+}=\mathbb{C} e_{1} \oplus \mathbb{C} e_{2}$ and $U_{-}=\mathbb{C} e_{3} \oplus \mathbb{C} e_{4}$ by using the canonical basis $\left\{e_{1}, e_{2}, e_{3}, e_{4}\right\}$ of $\mathbb{C}^{4}$. Then we have

$$
K_{\mathbb{C}}=Q \cap \bar{Q}
$$

where $Q=\left\{g \in G_{\mathbb{C}} \mid g U_{+}=U_{+}\right\}$and $\bar{Q}=\left\{g \in G_{\mathbb{C}} \mid g U_{-}=U_{-}\right\}$.
The full flag manifold $X$ of $G_{\mathbb{C}}$ consists of the flags $\left(V_{1}, V_{2}\right)$ in $\mathbb{C}^{4}$ where $\operatorname{dim} V_{j}=$ $j, V_{1} \subset V_{2}$ and ${ }^{t} u J v=0$ for all $u, v \in V_{2}$. Let $B$ denote the Borel subgroup of $G_{\mathbb{C}}$ defined by

$$
B=\left\{g \in G_{\mathbb{C}} \mid g \mathbb{C} e_{1}=\mathbb{C} e_{1} \text { and } g U_{+}=U_{+}\right\}
$$

Then the full flag manifold $X$ is identified with $G_{\mathbb{C}} / B$ by the map

$$
g B \mapsto\left(V_{1}, V_{2}\right)=\left(g \mathbb{C} e_{1}, g U_{+}\right)
$$

There are eleven $K_{\mathbb{C}}$-orbits

$$
\begin{aligned}
S_{1} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2}=U_{+}\right\} \\
S_{2} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2}=U_{-}\right\} \\
S_{3} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset U_{+}, \operatorname{dim}\left(V_{2} \cap U_{-}\right)=1\right\} \\
S_{4} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset U_{-}, \operatorname{dim}\left(V_{2} \cap U_{+}\right)=1\right\} \\
S_{5} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset U_{+}\right\}-\left(S_{1} \sqcup S_{3}\right) \\
S_{6} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset U_{-}\right\}-\left(S_{2} \sqcup S_{4}\right) \\
S_{7} & =\left\{\left(V_{1}, V_{2}\right) \mid \operatorname{dim}\left(V_{2} \cap U_{+}\right)=\operatorname{dim}\left(V_{2} \cap U_{-}\right)=1\right\}-\left(S_{3} \sqcup S_{4}\right) \\
S_{8} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \cap U_{+}=\{0\}, \operatorname{dim}\left(V_{2} \cap U_{+}\right)=1, V_{2} \cap U_{-}=\{0\}\right\} \\
S_{9} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \cap U_{-}=\{0\}, \operatorname{dim}\left(V_{2} \cap U_{-}\right)=1, V_{2} \cap U_{+}=\{0\}\right\} \\
S_{10} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2} \cap U_{ \pm}=\{0\},{ }^{t} v J \tau(v)=0 \text { for } v \in V_{1}\right\} \\
S_{\mathrm{op}} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2} \cap U_{ \pm}=\{0\},{ }^{t} v J \tau(v) \neq 0 \text { for } v \in V_{1}-\{0\}\right\}
\end{aligned}
$$

on $X$ where

$$
\tau(v)=\left(\begin{array}{cc}
I_{2} & 0 \\
0 & -I_{2}
\end{array}\right) v
$$

for $v \in \mathbb{C}^{4}$. These orbits are related as follows (MO], Fig. 12):

Let $P_{1}$ and $P_{2}$ be the parabolic subgroups of $G_{\mathbb{C}}$ defined by

$$
P_{1}=Q \quad \text { and } \quad P_{2}=\left\{g \in G_{\mathbb{C}} \mid g \mathbb{C} e_{1}=\mathbb{C} e_{1}\right\}
$$

respectively. Then the above diagram implies, for example, that

$$
S_{1} P_{2}=S_{5} P_{2} \quad \text { and that } \quad \operatorname{dim} S_{1}=\operatorname{dim} S_{5}-1
$$

by the arrow attached with the number 2 joining $S_{1}$ and $S_{5}$.
On the other hand define subsets

$$
\begin{gathered}
C_{+}=\left\{z \in \mathbb{C}^{4} \mid(z, z)>0\right\}, \quad C_{-}=\left\{z \in \mathbb{C}^{4} \mid(z, z)<0\right\} \\
\text { and } \quad C_{0}=\left\{z \in \mathbb{C}^{4} \mid(z, z)=0\right\}
\end{gathered}
$$

of $\mathbb{C}^{4}$ using the Hermitian form $(w, z)=\overline{w_{1}} z_{1}+\overline{w_{2}} z_{2}-\overline{w_{3}} z_{3}-\overline{w_{4}} z_{4}$ defining $U(2,2)$. For $v \in \mathbb{C}^{4}$ define subspaces

$$
v^{J}=\left\{\left.u \in \mathbb{C}^{4}\right|^{t} v J u=0\right\} \quad \text { and } \quad v^{\perp}=\left\{u \in \mathbb{C}^{4} \mid(v, u)=0\right\}
$$

of $\mathbb{C}^{4}$. Then $C_{0}$ is devided as $C_{0}=C_{0}^{s} \sqcup C_{0}^{r}$ where

$$
C_{0}^{s}=\left\{v \in C_{0} \mid v^{J}=v^{\perp}\right\} \quad \text { and } \quad C_{0}^{r}=\left\{v \in C_{0} \mid v^{J} \neq v^{\perp}\right\}
$$

The $G_{\mathbb{R}^{-} \text {-orbits on }} X$ are

$$
\begin{aligned}
S_{1}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2}-\{0\} \subset C_{+}\right\} \\
S_{2}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{2}-\{0\} \subset C_{-}\right\} \\
S_{3}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{+}, V_{2} \cap C_{-} \neq \phi\right\} \\
S_{4}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{-}, V_{2} \cap C_{+} \neq \phi\right\} \\
S_{5}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{+}, V_{2} \cap C_{0}^{s} \neq\{0\}\right\} \\
S_{6}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{-}, V_{2} \cap C_{0}^{s} \neq\{0\}\right\} \\
S_{7}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{0}^{r}, V_{2} \not \subset C_{0}\right\} \\
S_{8}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset C_{0}^{s}, V_{2} \cap C_{+} \neq \phi\right\} \\
S_{9}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset C_{0}^{s}, V_{2} \cap C_{-} \neq \phi\right\} \\
S_{10}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1}-\{0\} \subset C_{0}^{r}, V_{2} \subset C_{0}\right\} \\
S_{\mathrm{op}}^{\prime} & =\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset C_{0}^{s}, V_{2} \subset C_{0}\right\} .
\end{aligned}
$$

Here the $K_{\mathbb{C}}$-orbit $S_{j}$ and the $G_{\mathbb{R}}$-orbit $S_{j}^{\prime}$ correspond by the duality for each $j=1, \ldots, 10$, op.

Take a maximal abelian subspace

$$
\mathfrak{j}=\left\{\left.Y\left(a_{1}, a_{2}\right)=\left(\begin{array}{cccc}
a_{1} & 0 & 0 & 0 \\
0 & a_{2} & 0 & 0 \\
0 & 0 & -a_{1} & 0 \\
0 & 0 & 0 & -a_{2}
\end{array}\right) \right\rvert\, a_{1}, a_{2} \in \mathbb{R}\right\}
$$

of $i \mathfrak{m}$. Using the linear forms $e_{j}: Y\left(a_{1}, a_{2}\right) \mapsto a_{j}$ for $j=1$, 2 , we can write

$$
\Delta=\left\{ \pm 2 e_{1}, \pm 2 e_{2}, \pm e_{1} \pm e_{2}\right\} \quad \text { and } \quad \Delta_{n}^{+}=\left\{2 e_{1}, 2 e_{2}, e_{1}+e_{2}\right\}
$$

Write $\beta_{1}=2 e_{1}, \beta_{2}=2 e_{2}$ and $\delta=e_{1}+e_{2}$. Take root vectors $X_{1}=-E_{13}$ of $\mathfrak{g}_{\mathbb{C}}\left(\mathfrak{j}, \beta_{1}\right)$ and $X_{2}=-E_{24}$ of $\mathfrak{g}_{\mathbb{C}}\left(\mathfrak{j}, \beta_{2}\right)$ where $E_{i j}(i, j=1, \ldots, 4)$ denotes the matrix units.

Define

$$
t_{1}(s)=\exp s\left(X_{1}-\overline{X_{1}}\right)=\exp s\left(E_{31}-E_{13}\right)=\left(\begin{array}{cccc}
\cos s & 0 & -\sin s & 0 \\
0 & 1 & 0 & 0 \\
\sin s & 0 & \cos s & 0 \\
0 & 0 & 0 & 1
\end{array}\right)
$$

and

$$
t_{2}(s)=\exp s\left(X_{2}-\overline{X_{2}}\right)=\exp s\left(E_{42}-E_{24}\right)=\left(\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & \cos s & 0 & -\sin s \\
0 & 0 & 1 & 0 \\
0 & \sin s & 0 & \cos s
\end{array}\right)
$$

for $s \in \mathbb{R}$. Then we can write the Akhiezer-Gindikin domain $D$ as

$$
D=G_{\mathbb{R}} T^{+} K_{\mathbb{C}}
$$

where $T^{+}=\left\{t_{1}\left(s_{1}\right) t_{2}\left(s_{2}\right)| | s_{1}\left|<\pi / 4,\left|s_{2}\right|<\pi / 4\right\}\right.$. Write $c_{\beta_{j}}=t_{j}(\pi / 4)$ and $w_{\beta_{j}}=t_{j}(\pi / 2)$ for $j=1,2$. Then we can write

$$
S_{j}=K_{\mathbb{C}} g B \quad \text { and } \quad S_{j}^{\prime}=G_{\mathbb{R}} g B
$$

for $j=1, \ldots, 10$, op with the following representatives $g$ (M1], Theorem 2):

| $j$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | op |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $g$ | $e$ | $w_{\beta_{1}} w_{\beta_{2}}$ | $w_{\beta_{2}}$ | $w_{\beta_{1}}$ | $c_{\beta_{2}}$ | $c_{\beta_{2}} w_{\beta_{1}}$ | $c_{\delta} w_{\beta_{2}}$ | $c_{\beta_{1}}$ | $c_{\beta_{1}} w_{\beta_{2}}$ | $c_{\delta}$ | $c_{\beta_{1}} c_{\beta_{2}}$ |

Here

$$
c_{\delta}=\frac{1}{\sqrt{2}}\left(\begin{array}{cccc}
1 & 0 & 0 & -1 \\
0 & 1 & -1 & 0 \\
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1
\end{array}\right)=\exp \frac{\pi}{4}\left(X_{\delta}-\overline{X_{\delta}}\right)
$$

with $X_{\delta}=-\left(E_{14}+E_{23}\right) \in \mathfrak{g}_{\mathbb{C}}(\mathfrak{j}, \delta)$.
The standard maximal flag manifold $G_{\mathbb{C}} / Q$ is identified with the space $Y$ of two dimensional subspaces $V_{+}$of $\mathbb{C}^{4}$ such that ${ }^{t} u J v=0$ for all $u, v \in V_{+}$by the map

$$
G_{\mathbb{C}} / Q \ni g Q \mapsto V_{+}=g U_{+} \in Y
$$

Similarly we also identify $G_{\mathbb{C}} / \bar{Q}$ with $Y$ by the map

$$
G_{\mathbb{C}} / \bar{Q} \ni g \bar{Q} \mapsto V_{-}=g U_{-} \in Y
$$

As in Section 2 the complex symmetric space $G_{\mathbb{C}} / K_{\mathbb{C}}$ is naturally identified with the open subset

$$
\left\{\left(V_{+}, V_{-}\right) \in G_{\mathbb{C}} / Q \times G_{\mathbb{C}} / \bar{Q} \mid V_{+} \cap V_{-}=\{0\}\right\}
$$

of $G_{\mathbb{C}} / Q \times G_{\mathbb{C}} / \bar{Q} \cong Y \times Y$ by the map

$$
\iota: g K_{\mathbb{C}} \mapsto\left(V_{+}, V_{-}\right)=\left(g U_{+}, g U_{-}\right)
$$

Then the Akhiezer-Gindikin domain $D / K_{\mathbb{C}}$ is identified with

$$
G_{\mathbb{R}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}=\left\{\left(V_{+}, V_{-}\right) \in Y \times Y \mid V_{+}-\{0\} \subset C_{+} \text {and } V_{-}-\{0\} \subset C_{-}\right\}
$$

Let $x K_{\mathbb{C}}$ be an element of $\partial\left(D / K_{\mathbb{C}}\right)$ such that $\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} c_{\beta_{1}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}$. Then it follows from Lemma 2.3 that

$$
x K_{\mathbb{C}} g B \cap G_{\mathbb{R}} c_{\beta_{1}} g B \neq \phi
$$

for $g=e, w_{\beta_{2}}$ and $c_{\beta_{2}}$. This implies that

$$
\begin{gather*}
x S_{1} \cap S_{8}^{\prime} \neq \phi,  \tag{3.1}\\
x S_{3} \cap S_{9}^{\prime} \neq \phi \tag{3.2}
\end{gather*}
$$

and that

$$
\begin{equation*}
x S_{5} \cap S_{\mathrm{op}}^{\prime} \neq \phi \tag{3.3}
\end{equation*}
$$

Since $S_{7}^{\prime c l}=\left\{\left(V_{1}, V_{2}\right) \mid V_{1} \subset C_{0}\right\} \supset S_{9}^{\prime}$, it follows from (3.2) that

$$
\begin{equation*}
x S_{3} \cap S_{7}^{\prime c l} \neq \phi \tag{3.4}
\end{equation*}
$$

On the other hand since $S_{10}^{\prime}{ }^{c l} \supset S_{\mathrm{op}}^{\prime}$, it follows from (3.3) that

$$
\begin{equation*}
x S_{5} \cap S_{10}^{\prime}{ }^{c l} \neq \phi \tag{3.5}
\end{equation*}
$$

Remark 3.1. (i) If $\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} Q / Q \times G_{\mathbb{R}} \overline{c_{\beta_{1}}} \bar{Q} / \bar{Q}$, then we can prove

$$
\begin{gathered}
x S_{2} \cap S_{9}^{\prime} \neq \phi, \quad x S_{4} \cap S_{8}^{\prime} \neq \phi, \quad x S_{6} \cap S_{\mathrm{op}}^{\prime} \neq \phi \\
x S_{4} \cap S_{7}^{\prime c l} \neq \phi \quad \text { and } \quad x S_{6} \cap{S_{10}^{\prime}}^{c l} \neq \phi
\end{gathered}
$$

in the same way.
(ii) If we apply [M4], Theorem 1.3, to this case, then we have

$$
x \in \partial D \Longrightarrow x\left(S_{5} \sqcup S_{6}\right)^{c l} \cap S_{\mathrm{op}}^{\prime} \neq \phi
$$

So we see that the results in this paper are refinements of this theorem for Hermitian cases.

By (3.4) and (3.5) we proved the following.
Proposition 3.2. If $\iota\left(x K_{\mathbb{C}}\right) \in G_{\mathbb{R}} c_{\beta_{1}} Q / Q \times G_{\mathbb{R}} \bar{Q} / \bar{Q}$, then we have:
(i) $x K_{\mathbb{C}} w_{\beta_{2}} B \cap\left(G_{\mathbb{R}} c_{\delta} w_{\beta_{2}} B\right)^{c l} \neq \phi$.
(ii) $x K_{\mathbb{C}} c_{\beta_{2}} B \cap\left(G_{\mathbb{R}} c_{\delta} B\right)^{c l} \neq \phi$.

Remark 3.3. It is clear that $K_{\mathbb{C}} w_{\beta_{2}} B=S_{3} \subset S_{7}^{c l}=\left(K_{\mathbb{C}} c_{\delta} w_{\beta_{2}} B\right)^{c l}$ and that $K_{\mathbb{C}} c_{\beta_{2}} B=S_{5} \subset S_{10}^{c l}=\left(K_{\mathbb{C}} c_{\delta} B\right)^{c l}$.

## Acknowledgement

The author would like to express his hearty thanks to S. Gindikin for valuable suggestions and encouragements.
