ABSTRACT Data of butterflies collected in Lambir Hills National Park, Sarawak, Malaysia in Borneo, and in its surrounding areas since 1996 are presented. In addition, the data of observation for several species witnessed but not caught are also presented. In total, 347 butterfly species are listed with biological information (habitat etc.) when available.

Introduction

The primary lowland forests in the Southeast Asian (SEA) tropics are characterized by the extremely species-rich biodiversity (Whitmore 1998). Arthropod assemblages comprise the main part of the biodiversity in tropical rainforests (Erwin 1982, Wilson 1992). Many inventory studies have been done focusing on various arthropod taxa to reveal the species-richness of arthropod assemblages in SEA tropical rainforests (*e.g.* Holloway & Intachat 2003). The butterfly is one of the most studied taxonomic groups in arthropods in the SEA region; the accumulated information on the taxonomy and geographic distribution were organized by Tsukada & Nishiyama (1980), Yata & Morishita (1981), Aoki et al. (1982) and Tsukada (1985, 1991). The inventories of butterflies in Borneo were presented by Otsuka (1988), Maruyama & Otsuka (1991) and Seki et al. (1991). However, the local faunas in the island have not been well described. For their conservation and biogeographical studies at finer spatial scales, more detailed information on distribution of individual species is required.

At Lambir Hills National Park, Sarawak, Malaysia, there is a well-reserved primary lowland dipterocarp forest, which is characterized by highly species-rich flora (Condit et al. 2000, Ashton 2005). There, we have done inventory work on arthropod fauna since 1992 when the Canopy Biology Program Sarawak started (Inoue et al. 1995, Sakai et al. 2005). In particular, we have been pouring strenuous efforts into butterfly inventory since 1997. Here, we present raw data of all the butterflies collected from the primary forest and surrounding areas of the national park.

Study site and Methods

Lambir Hills National Park ($4^{\circ}2'N$, $113^{\circ}50'E$, 150–200 m asl; Fig. 1) locates in the lowland *ca.* 10 km from the northwest seashore of Borneo. The vegetation is classified as a typical lowland mixed dipterocarp forest (Ashton & Hall 1992) with extremely high tree species diversity (Condit *et al.* 2000, Ashton 2005). The area has a typical tropical rainforest climate; the mean annual temperature is *ca.* 26°C and the monthly rainfall is rarely less than 100 mm (Sakai *et al.* 1999, Nakagawa *et al.* 2000, Ichie *et al.* 2004). There is a canopy-access system consisting of several aerial walkways in the forest canopy, and towers and ladders set against canopy trees (see Inoue *et al.* 1995 for the details). The canopy reached 50 m in height, with a few emergent trees reaching 70 m. The details of the study site were described in Inoue *et al.* (1995) and Sakai & Roubik (2005).

At this site, butterflies have been haphazardly collected by some field researchers mainly in the primary forest and along the forest edges since 1994. We conducted route census on butterflies along the forest edges and riversides, at the forest gaps and forest floors, and in the open habitats surrounding the primary forest in the national park every two weeks from 1999 to 2004. We collected as many butterflies as possible in the route census, and several times in the forest canopy using the canopy access system. In addition, we conducted collections at 24 sites around the national park (Fig. 1). Of the 25 sites, nine, fourteen, and one were located in isolated primary forests, secondary forests, and cultivated field, respectively. At each of the sites, we collected at least seven times from August 2003 to August 2006. We also haphazardly collected butterfly larvae and reared them to get the adult specimens. Thus, many butterflies have been collected for approximately ten years in the study site.

A small part of collected butterflies have not been mounted, but were kept in envelopes, without their wings spread, and excluded from this study. On the other hand, several species which were witnessed but not caught due to technical difficulties or the rules are presented here.

All the collected butterflies were identified to a named species by the authors. All specimens will be deposited in the Forest Research Center, Sarawak, Malaysia, the Kyoto University Museum, Kyoto, Japan, or the Kyushu University Museum, Fukuoka, Japan.

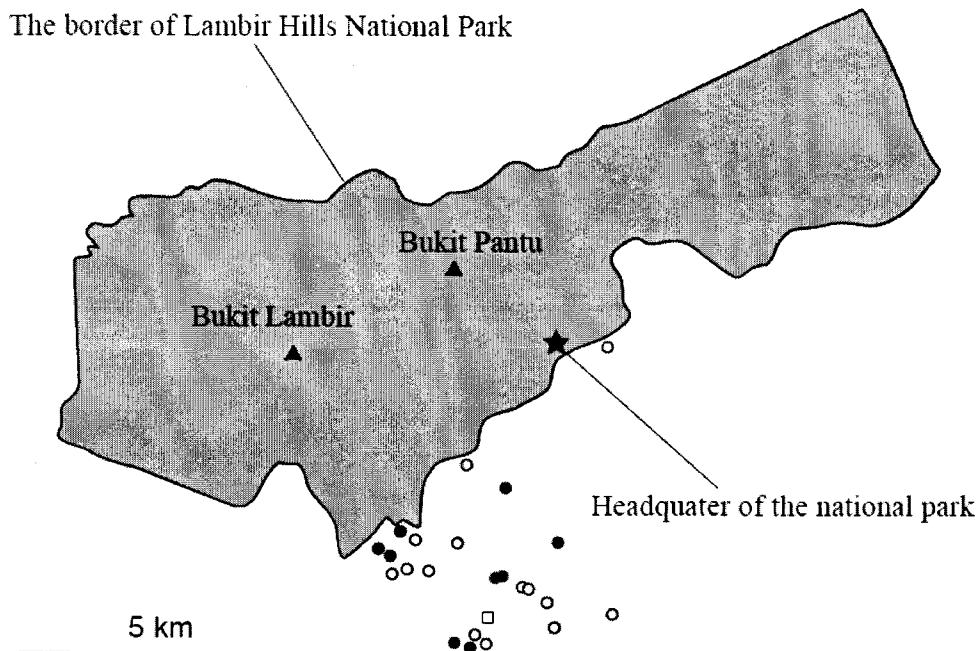

Figure 1. Collection sites around Lambir Hills National Park: nine isolated primary forest stands (closed circle), fourteen secondary forest stands (open circle), and one cultivated area (open square). The grey area indicates the area of the national park, which was covered mainly by the mixed dipterocarp primary forest.

Results and Discussion

We collected 3,000 butterflies in total, classified into 341 species. In addition, six species were witnessed. Thus, in and around the Lambir Hills National Park, 347 butterfly species were recorded consisting of 22 species of Papilionidae, 25 species of Pieridae, 135 species of Nymphalidae, 115 species of Lycaenidae, and 50 species of Hesperiidae. Of all the species recorded this time, *Thauria aliris* (Nymphalidae), *Junonia almana* (Nymphalidae), *Cyrestis cocles* (Nymphalidae), *Arhopala horsfieldi* (Lycaenidae), *Semanga superba* (Lycaenidae), *Tagiades ultra* (Hesperiidae), *Halpe pelethronix* (Hesperiidae), *Potanthus hetaerus* (Hesperiidae) have been so far observed only in the secondary forests but not in the national park area yet. The other species were

observed in the national park area at least once.

In addition to the species listed here, we have specimens of at least 15 lycaenid and 4 hesperiid species uncheckered and not included in the list. Therefore, more than 20 species will be added to the list in the near future. Although an adult of *Lamproptera* sp. was once observed by Tzuchiya, this data is not included in the list because he could not determine whether it was *L. curius* or *L. meges*; both are distributed in Borneo (Otsuka 1988) and at least one of the two is considered to occur in the study site. Moreover, some specimens of another hesperiid species (*Pyroneura* sp.) were recently obtained from the national park.

The number of specimens notably varied among species (see the list shown below). This variation seems to be partly due to the difference in abundance and partly due to that in detectability. For most of rare species, only one or 2 individuals each were observed during the study period.

Although the seasonality, habitat preference, and mating and foraging behaviors remain to be investigated in more detail, we here present an inventory of butterfly in the primary forest and surrounding areas in Lambir Hills National Park, Sarawak, Malaysia.

A List of Butterflies in Lambir Hills National Park, Sarawak

This list consists of the data of all butterfly specimens that were collected in Lambir Hills National Park, Sarawak and at several plots in secondary forests or cultivated fields around the park. The list includes the date of collection, sex, type of habitats where it was collected, ID number of specimen, collector's name, and place of specimen's storage, under species name. Additional information is given, such as host plants, flowering plants visited, notable behavioral traits and so on, if they are available.

The abbreviations of types of habitats are as follows:

- P1 = trails, riversides, or gaps in the primary forest;
- P2 = shaded forest floors in the primary forest;
- P3 = canopy of the primary forest;
- ED = forest edges;
- OH = open habitats neighboring the primary or secondary forests;
- SF = secondary forests around the national park;
- IP = isolated primary forests around the national park
- CF = cultivated fields around the national park
- SB = shrub bush occurring since 2 to 4 years after the latest slash-and-burn deforestation around the national park;
- UK = (unknown habitat type).

The superscripts attached to the types of habitat indicate the collecting methods other than simple net-swinging as follows: L, light-trapping; B, bait-trapping with banana; CR, bait-trapping with carrion of fish or shrimp; R, rearing of larvae; F, collected at the time of flower-visiting.

The abbreviations of collector's name are as follows: AB, Masahiro Aiba; EC, (employed collectors); HA, Aya Hatada; IC, Tomoaki Ichie; IT, Takao Itioka; KY, Keiko Kishimoto-Yamada; MD, Daigo Matsumoto; MR, Kaori Murase; NA, Michiko Nakagawa; NK, Tohru Nakashizuka; NM, Masahiro Nomura; OK, Tadahiro Okubo; SK, Hirotoshi Sako; SM, Hiromitsu Samejima; SY, Yuko Shimada; TK, Yayoi Takeuchi; TT, Taizo Tzuchiya; UC, (unknown collectors); YG, Masaya Yago; YM, Takuji Yamamoto; YT, Osamu Yata; YO, Jiichiro Yoshimoto. These are described in parentheses.

The abbreviations of place of specimen's storage are as follows: F, Forest Research Centre, Sarawak; K, Kyushu University Museum; T, Kyoto University Museum.

We basically accorded to Otsuka (1988), Seki et al. (1991), and Maruyama & Otsuka (1991) for the arrangement of specific and subspecific names, and to Ackery et al. (1998) for the classification of family and subfamily levels. However, some scientific names followed the current studies (Tsukada 1991, Eliot 1992, Vane-Wright & Gaonkar 2006): *Idea stolli alcine* (= *I. stolli virgo*), *Euploea eunice* (= *E. leucostictos*), *Euploea radamanthus* (= *E. diocletianus*), *Tacola larymna* (= *Athyma larymna*), *Tanaecia pelea lutala* (= *T. pelea djataca*), *Cynitia godartii* (= *Euthalia godartii*), *Cynitia iapis* (= *Euthalia iapis*), *Euthalia aconthea borneensis* (= *E. aconthea sandakana*), *Lexias pardalis borneensis* (= *L. pardalis dirteana*), *Lexias bankana* (= *L. cyanipardus*), *Dichorragia nesimachus machates* (= *D. nesimachus derdas*), *Charaxes borneensis borneensis* (= *C. borneensis daemoniacus*), *Arhopala centaurus* (= *A. pseudocentaurus*), *Rachana jalindra* (= *Eliotia jalindra*), *Choaspes stigmatus* (= *C. plateni*). In accordance with the classification of Eliot (1992), *Xanthotaenia busiris* was included in Satyrinae (Nymphalidae).

Superfamily Papilioidea**Family Papilionidae****Subfamily Papilioninae**

Trogonoptera brookiana brookiana (Wallace)

Complying with the rule banning the catch of this species, we did not collect any individuals of this species. However, we confirmed that this is a common species in the study site. All the year around, both male and female adults have been frequently observed in the field since the start of this study. The main habitats of adults are riversides, gaps, canopy, and edge of the primary forest. Sometimes male adults are seen leaving the primary forest for the surrounding outside secondary forests or open habitats, but females appear to rarely leave the primary forests.

Troides amphrysus flavicollis Druce

Complying with the rule banning the catch of this species, we did not collect any individuals of this species. However, we confirmed its constant occurrence in the study site. Adults of both sexes have sometimes been observed since the start of this study. Although the seasonality of adult occurrence has not been well investigated yet, no remarkable bias was not found in the period of adult occurrence (TI unpubl. data). The chance of witness of adults is likely to be rather lower than that in the former species. The main habitat of adults is canopy and edge of the primary forest.

Acknowledgements

We thank J. Kendawang (Forest Department Sarawak) and L. Chong (Sarawak Forestry Corporation) for their permission to conduct research in the study area. We also thank Het Kaliang and the other staff of Forest Research Center, Sarawak for giving full facilities to our field census, and Tohru Nakashizuka for supporting our research. We are also grateful to researchers of the Lambir Hills National Park for their support, especially for researchers who contributed to butterfly collection (their names are presented on page 29). This study was financially supported by Grant-in-Aids (no. 17405006 to T. I.) and RIHN Research Project 2-2 from the Japanese Ministry of Education, Science, and Culture.
