SYMMETRIC CRYSTALS
AND
LLTA TYPE CONJECTURES FOR THE AFFINE HECKE ALGEBRAS
OF TYPE B

NAOYA ENOMOTO AND MASAKI KASHIWARA

ABSTRACT. In the previous paper [EK1], we formulated a conjecture on the relations between certain classes of irreducible representations of affine Hecke algebras of type B and symmetric crystals for \mathfrak{gl}_∞ . In the first half of this paper (sections 2 and 3), we give a survey of the LLTA type theorem of the affine Hecke algebra of type A. In the latter half (sections 4, 5 and 6), we review the construction of the symmetric crystals and the LLTA type conjectures for the affine Hecke algebra of type B.

1. INTRODUCTION

1.1. The Lascoux-Leclerc-Thibon-Ariki theory connects the representation theory of the affine Hecke algebra of *type A* with representations of the affine quantum enveloping algebra of *type A*. Recently, we presented the notion of symmetric crystals and conjectured that certain classes of irreducible representations of the affine Hecke algebras of *type B* are described by symmetric crystals for \mathfrak{gl}_∞ or $A_{\ell-1}^{(1)}$ ([EK1]). In this paper, we review the LLTA-theory for the affine Hecke algebra of *type A*, the symmetric crystals, and then our conjectures for the affine Hecke algebra of *type B*. *For the sake of simplicity, we restrict ourselves in this note to the case where the parameters of the affine Hecke algebras are not a root of unity.*

This paper is organized as follows. In part I (sections 2 and 3), we review the LLTA-theory for the affine Hecke algebras of *type A*. In section 2, we recall the representation theory of $U_q(\mathfrak{gl}_\infty)$, especially the PBW basis, the crystal basis and the global basis. In section 3, we recall the representation theory of the affine Hecke algebra of *type A* and state the LLTA-type theorems. In part II (sections 4, 5 and 6), we explain symmetric crystals for \mathfrak{gl}_∞ and the LLTA type conjectures for the affine Hecke algebras of *type B*. In section 4, we recall the construction of symmetric crystals based on [EK1] and state the conjecture of existence of the crystal basis and the global basis. In section 5, we explain a combinatorial realization of the symmetric crystals for \mathfrak{gl}_∞ by using the PBW type basis and the θ -restricted multisegments. This section is a new additional part to the announcement [EK1]. The details will appear in [EK2]. In section 6, we explain the representation theory of the affine Hecke algebra of *type B* and state our LLTA-type conjectures for the affine Hecke algebra of *type B*. We add proofs of lemmas and propositions in [EK1, section 3.4].

1.2. Let us recall the LLTA-theory for the affine Hecke algebra of *type A*.

The representation theory of quantum enveloping algebras and the representation theory of affine Hecke algebras have developed independently. G. Lusztig [L] constructed the PBW type basis and canonical basis of $U_q^-(\mathfrak{g})$ for the *A, D, E* cases. The second author [Kas]

The second author is partially supported by Grant-in-Aid for Scientific Research (B) 18340007, Japan Society for the Promotion of Science.

defined the crystal basis $B(\infty)$ and the (lower and upper) global bases $\{G^{\text{low}}(b)\}_{b \in B(\infty)}$, $\{G^{\text{up}}(b)\}_{b \in B(\infty)}$ of $U_q(\mathfrak{g})$. The lower global basis coincides with Lusztig's canonical basis. On the other hand, A. V. Zelevinsky [Z] gave a parametrization of the irreducible representations of the affine Hecke algebra of type A by using multisegments. Chriss-Ginzburg [CG] and Kazhdan-Lusztig [KL] constructed all the irreducible representations of the affine Hecke algebras in geometric methods.

Lascoux-Leclerc-Thibon conjectured in [LLT] that certain composition multiplicities (called the decomposition numbers) of the Hecke algebra of type A can be written by the transition matrices (specialized at $q = 1$) between the upper global basis and a standard basis of the level 1 fundamental representation of $U_q(\widehat{\mathfrak{sl}}_\ell)$. In [A], S. Ariki generalized and solved the conjecture for the cyclotomic Hecke algebra and the affine Hecke algebra of type A by using the geometric representation theory of the affine Hecke algebra of type A . In [GV], I. Grojnowski and M. Vazirani proved the multiplicity-one results for the socle of certain restriction functors and the cosocle of certain induction functors on the category of the finite-dimensional representations of the affine Hecke algebras \mathcal{H}^A of type A . By using these functors, Grojnowski ([G]) gave the crystal structure on the set of irreducible modules over the affine Hecke algebras \mathcal{H}^A of type A . In [V], Vazirani combinatorially constructed the crystal operators on the set of multisegments and proved the compatibility between her actions and Grojnowski's actions.

For $p \in \mathbb{C}^*$, let $\mathcal{H}_n^A(p)$ be the affine Hecke algebra of type A of degree n generated by T_i ($1 \leq i \leq n-1$) and $X_j^{\pm 1}$ ($1 \leq j \leq n$). For a subset J of \mathbb{C}^* , we say that a finite-dimensional \mathcal{H}_n^A -module is of type J if all the eigenvalues of X_j ($1 \leq j \leq n$) belong to J . We can prove that in order to study the irreducible modules over the affine Hecke algebras of type A , it is enough to treat those of type J for an orbit J with respect to the \mathbb{Z} -action on \mathbb{C}^* generated by $a \mapsto ap^2$ (see Lemma 3.3). For a \mathbb{Z} -orbit J , let $K_J(\mathcal{H}_n^A)$ be the Grothendieck group of the abelian category of finite-dimensional \mathcal{H}_n^A -modules of type J , and $K_J^A = \bigoplus_{n \geq 0} K_J(\mathcal{H}_n^A)$. The LLTA-theory gives the following correspondence between the notions in the representation theory of a quantum enveloping algebra $U_q(\mathfrak{gl}_\infty)$ and the ones in the representation theory of affine Hecke algebras of type A .

the quantum enveloping algebra $U_q(\mathfrak{gl}_\infty)$	the affine Hecke algebra of type A $\mathcal{H}_n^A(p)$ ($n \geq 0$)
$U_q^-(\mathfrak{gl}_\infty)$	$K_J^A = \bigoplus_{n \geq 0} K_J(\mathcal{H}_n^A(p))$
e'_a, f_a	certain restrictions e_a and inductions f_a
the crystal basis $B(\infty)$	$\mathcal{M} = \{\text{the multisegments}\}$
the upper global basis $\{G^{\text{up}}(b)\}_{b \in B(\infty)}$	the irreducible modules $\{L_b\}_{b \in B(\infty)}$
the modified root operators \tilde{e}_a, \tilde{f}_a	$\tilde{e}_a = \text{soc}(e_a), \tilde{f}_a = \text{cosoc}(f_a)$ $\tilde{e}_a L_b = L_{\tilde{e}_a b}, \tilde{f}_a L_b = L_{\tilde{f}_a b}$
the PBW basis $\{P(b)\}_{b \in B(\infty)}$	the standard modules $\{M(b)\}_{b \in B(\infty)}$

FIGURE 1. Lascoux-Leclerc-Thibon-Ariki correspondence in type A

The additive group K_J^A has a structure of Hopf algebra by the restriction and the induction. The set J may be regarded as a Dynkin diagram with J as the set of vertices

and with edges between $a \in J$ and ap^2 . Let \mathfrak{g}_J be the associated Lie algebra, and $\mathfrak{g}_{\bar{J}}$ the unipotent Lie subalgebra. Hence \mathfrak{g}_J is isomorphic to \mathfrak{gl}_{∞} if p has an infinite order. Let U_J be the group associated to $\mathfrak{g}_{\bar{J}}$. Then $\mathbb{C} \otimes K_J^A$ is isomorphic to the algebra $\mathcal{O}(U_J)$ of regular functions on U_J . Let $U_q(\mathfrak{g}_J)$ be the associated quantized enveloping algebra. Then $U_q^-(\mathfrak{g}_J)$ has a crystal basis $B(\infty)$ and an upper global basis $\{G^{\text{up}}(b)\}_{b \in B(\infty)}$. By specializing $\bigoplus \mathbb{C}[q, q^{-1}]G^{\text{up}}(b)$ at $q = 1$, we obtain $\mathcal{O}(U_J)$. Then the LLTA-theory says that the elements associated to the irreducible \mathcal{H}^A -modules correspond to the image of the upper global basis. Namely, each $b \in B(\infty)$, an irreducible \mathcal{H}^A -module L_b is associated and we have

$$[e_a L_b : L_{b'}] = e'_{a,b,b'}|_{q=1}, \quad [f_a L_b : L_{b'}] = f_{a,b,b'}|_{q=1}.$$

Here $[e_a L_b : L_{b'}]$ and $[f_a L_b : L_{b'}]$ are the composition multiplicities of $L_{b'}$ of $e_a L_b$ and $f_a L_b$ in K_J^A . (For the definition of the functors e_a and f_a for $a \in J$, see Definition 3.4.) The Laurent polynomials $e'_{a,b,b'}$ and $f_{a,b,b'}$ are defined by

$$e'_a G^{\text{up}}(b) = \sum_{b' \in B(\infty)} e'_{a,b,b'} G^{\text{up}}(b'), \quad f_a G^{\text{up}}(b) = \sum_{b' \in B(\infty)} f_{a,b,b'} G^{\text{up}}(b').$$

1.3. Let us explain our analogous conjectures for the affine Hecke algebras of type B .

For $p_0, p_1 \in \mathbb{C}^*$, let $\mathcal{H}_n^B(p_0, p_1)$ be the affine Hecke algebra of type B generated by T_i ($0 \leq i \leq n-1$) and X_j ($1 \leq j \leq n$). The representation theory of $\mathcal{H}_n^B(p_0, p_1)$ of type B are studied by V. Miemietz and Syu Kato. In [M], V. Miemietz defined certain restriction functors E_a and the induction functors F_a on the category of the finite-dimensional representations of the affine Hecke algebras of type B , which are analogous to Grojnowski-Vazirani's construction, and proved the multiplicity-one results (see sections 6.3 and 6.4). On the other hand, S. Kato obtained in [Kat] a geometric parametrization of the irreducible representations of the affine Hecke algebra $\mathcal{H}_n^B(p_0, p_1)$, which is an analogue to geometric methods of Kazhdan-Lusztig and Chriss-Ginzburg.

We say that a finite-dimensional \mathcal{H}_n^B -module is of type $J \subset \mathbb{C}^*$ if all the eigenvalues of X_j ($1 \leq j \leq n$) belong to J . Let us consider the $\mathbb{Z} \rtimes \mathbb{Z}_2$ -action on \mathbb{C}^* generated by $a \mapsto ap_1^2$ and $a \mapsto a^{-1}$. We can prove that in order to study \mathcal{H}^B -modules, it is enough to study irreducible modules of type J for a $\mathbb{Z} \rtimes \mathbb{Z}_2$ -orbit J in \mathbb{C}^* such that J is a \mathbb{Z} -orbit or J contains one of $\pm 1, \pm p_0$ (see Proposition 6.4). Let $I = \mathbb{Z}_{\text{odd}}$ be the set of odd integers. In this paper, we consider the case $J = \{p_1^k \mid k \in I\}$ such that $\pm 1, \pm p_0 \notin J$. Let $K_J(\mathcal{H}_n^B)$ be the Grothendieck group of the abelian category of finite-dimensional representations of $\mathcal{H}_n^B(p_0, p_1)$ of type J .

Let α_a ($a \in J$) be the simple roots with

$$(\alpha_a, \alpha_b) = \begin{cases} 2 & \text{if } a = b, \\ -1 & \text{if } b = ap_1^{\pm 2}, \\ 0 & \text{otherwise.} \end{cases}$$

Then the corresponding Lie algebra is \mathfrak{gl}_{∞} . Let θ be the involution of J given by $\theta(a) = a^{-1}$. In sections 4 and 5, we introduce the ring $\mathcal{B}_{\theta}(\mathfrak{gl}_{\infty})$ and the $\mathcal{B}_{\theta}(\mathfrak{gl}_{\infty})$ -module $V_{\theta}(0)$. They are analogues of the reduced q -analogue $\mathcal{B}_q(\mathfrak{gl}_{\infty})$ generated by e'_a and f_a , and the $\mathcal{B}_q(\mathfrak{gl}_{\infty})$ -module $U_q^-(\mathfrak{gl}_{\infty})$. We can prove that $V_{\theta}(0)$ has the PBW type basis $\{P_{\theta}(b)\}_{b \in B_{\theta}(0)}$, the crystal basis $(L_{\theta}(0), B_{\theta}(0))$, the lower global basis $\{G_{\theta}^{\text{low}}(b)\}_{b \in B_{\theta}(0)}$ and the upper global basis $\{G_{\theta}^{\text{up}}(b)\}_{b \in B_{\theta}(0)}$. Moreover we can combinatorially describe the crystal structure by using the θ -restricted multisegments.

We conjecture that the irreducible \mathcal{H}^B -modules of type J are parametrized by $B_{\theta}(0)$ and if L_b is an irreducible \mathcal{H}^B -module associated to $b \in B_{\theta}(0)$, then we have $\tilde{E}_a L_b = L_{\tilde{E}_a b}$,

$\tilde{F}_a L_b = L_{\tilde{F}_a b}$ and $[E_a L_b : L_{b'}] = E_{a,b,b'}|_{q=1}$, $[F_a L_b : L_{b'}] = F_{a,b,b'}|_{q=1}$. (For the definition of the functors E_a, F_a, \tilde{E}_a and \tilde{F}_a for $a \in J$, see Definition 6.5.) Here the Laurent polynomials $E_{a,b,b'}$ and $F_{a,b,b'}$ are defined by

$$E_a G_\theta^{\text{up}}(b) = \sum_{b' \in B_\theta(0)} E_{a,b,b'} G_\theta^{\text{up}}(b'), \quad F_a G_\theta^{\text{up}}(b) = \sum_{b' \in B_\theta(0)} F_{a,b,b'} G_\theta^{\text{up}}(b').$$

the quantum enveloping algebra $U_q(\mathfrak{gl}_\infty)$ with θ	the affine Hecke algebra of type B $\mathcal{H}_n^B(p_0, p_1)$ ($n \geq 0$)
$V_\theta(0) = U_q^-(\mathfrak{gl}_\infty) / \sum_i U_q^-(\mathfrak{gl}_\infty)(f_i - f_{\theta(i)})$	$K_J^B = \bigoplus_{n \geq 0} K_J(\mathcal{H}_n^B(p_0, p_1))$

FIGURE 2. Conjectural correspondence in type B

Part I. Review on Lascoux-Leclerc-Thibon-Ariki Theory

2. REPRESENTATION THEORY OF $U_q(\mathfrak{gl}_\infty)$

2.1. Quantized universal enveloping algebras and its reduced q -analogues. We shall recall the quantized universal enveloping algebra $U_q(\mathfrak{g})$. Let I be an index set (for simple roots), and Q the free \mathbb{Z} -module with a basis $\{\alpha_i\}_{i \in I}$. Let $(\cdot, \cdot): Q \times Q \rightarrow \mathbb{Z}$ be a symmetric bilinear form such that $(\alpha_i, \alpha_i)/2 \in \mathbb{Z}_{>0}$ for any i and $(\alpha_i^\vee, \alpha_j) \in \mathbb{Z}_{\leq 0}$ for $i \neq j$ where $\alpha_i^\vee := 2\alpha_i/(\alpha_i, \alpha_i)$. Let q be an indeterminate and set $\mathbb{K} := \mathbb{Q}(q)$. We define its subrings $\mathbb{A}_0, \mathbb{A}_\infty$ and \mathbb{A} as follows.

$$\begin{aligned} \mathbb{A}_0 &= \{f \in \mathbb{K} \mid f \text{ is regular at } q = 0\}, \\ \mathbb{A}_\infty &= \{f \in \mathbb{K} \mid f \text{ is regular at } q = \infty\}, \\ \mathbb{A} &= \mathbb{Q}[q, q^{-1}]. \end{aligned}$$

Definition 2.1. *The quantized universal enveloping algebra $U_q(\mathfrak{g})$ is the \mathbb{K} -algebra generated by elements e_i, f_i and invertible elements t_i ($i \in I$) with the following defining relations.*

- (1) The t_i 's commute with each other.
- (2) $t_j e_i t_j^{-1} = q^{(\alpha_j, \alpha_i)} e_i$ and $t_j f_i t_j^{-1} = q^{-(\alpha_j, \alpha_i)} f_i$ for any $i, j \in I$.
- (3) $[e_i, f_j] = \delta_{ij} \frac{t_i - t_i^{-1}}{q_i - q_i^{-1}}$ for $i, j \in I$. Here $q_i := q^{(\alpha_i, \alpha_i)/2}$.
- (4) (Serre relation) For $i \neq j$,

$$\sum_{k=0}^b (-1)^k e_i^{(k)} e_j e_i^{(b-k)} = 0, \quad \sum_{k=0}^b (-1)^k f_i^{(k)} f_j f_i^{(b-k)} = 0.$$

Here $b = 1 - (\alpha_i^\vee, \alpha_j)$ and

$$e_i^{(k)} = e_i^k / [k]_i!, \quad f_i^{(k)} = f_i^k / [k]_i!, \quad [k]_i = (q_i^k - q_i^{-k}) / (q_i - q_i^{-1}), \quad [k]_i! = [1]_i \cdots [k]_i.$$

Let us denote by $U_q^-(\mathfrak{g})$ the subalgebra of $U_q(\mathfrak{g})$ generated by the f_i 's.

Let e'_i and e_i^* be the operators on $U_q^-(\mathfrak{g})$ defined by

$$[e_i, a] = \frac{(e_i^* a) t_i - t_i^{-1} e'_i a}{q_i - q_i^{-1}} \quad (a \in U_q^-(\mathfrak{g})).$$

These operators satisfy the following formulas similar to derivations:

$$(2.1) \quad \begin{aligned} e'_i(ab) &= e'_i(a)b + (\text{Ad}(t_i)a)e'_i b, \\ e_i^*(ab) &= a e_i^* b + (e_i^* a)(\text{Ad}(t_i)b). \end{aligned}$$

The algebra $U_q^-(\mathfrak{g})$ has a unique symmetric bilinear form (\cdot, \cdot) such that $(1, 1) = 1$ and

$$(e'_i a, b) = (a, f_i b) \quad \text{for any } a, b \in U_q^-(\mathfrak{g}).$$

It is non-degenerate and satisfies $(e_i^* a, b) = (a, b f_i)$. Let $\mathcal{B}(\mathfrak{g})$ be the algebra generated by the e'_i 's and the f_i 's. The left multiplication of f_j , e'_i and e_i^* have the commutation relations

$$e'_i f_j = q^{-(\alpha_i, \alpha_j)} f_j e'_i + \delta_{ij}, \quad e_i^* f_j = f_j e_i^* + \delta_{ij} \text{Ad}(t_i),$$

and both the e'_i 's and the e_i^* 's satisfy the Serre relations.

Definition 2.2. *The reduced q -analogue $\mathcal{B}(\mathfrak{g})$ of \mathfrak{g} is the $\mathbb{Q}(q)$ -algebra generated by e'_i and f_i .*

2.2. Review on crystal bases and global bases. Since e'_i and f_i satisfy the q -boson relation, any element $a \in U_q^-(\mathfrak{g})$ can be written uniquely as

$$a = \sum_{n \geq 0} f_i^{(n)} a_n \quad \text{with } e'_i a_n = 0.$$

Here $f_i^{(n)} = \frac{f_i^n}{[n]_i!}$.

Definition 2.3. *We define the modified root operators \tilde{e}_i and \tilde{f}_i on $U_q^-(\mathfrak{g})$ by*

$$\tilde{e}_i a = \sum_{n \geq 1} f_i^{(n-1)} a_n, \quad \tilde{f}_i a = \sum_{n \geq 0} f_i^{(n+1)} a_n.$$

Theorem 2.4 ([Kas]). *We define*

$$\begin{aligned} L(\infty) &= \sum_{\ell \geq 0, i_1, \dots, i_\ell \in I} \mathbf{A}_0 \tilde{f}_{i_1} \cdots \tilde{f}_{i_\ell} \cdot 1 \subset U_q^-(\mathfrak{g}), \\ B(\infty) &= \left\{ \tilde{f}_{i_1} \cdots \tilde{f}_{i_\ell} \cdot 1 \bmod qL(\infty) \mid \ell \geq 0, i_1, \dots, i_\ell \in I \right\} \subset L(\infty)/qL(\infty). \end{aligned}$$

Then we have

- (i) $\tilde{e}_i L(\infty) \subset L(\infty)$ and $\tilde{f}_i L(\infty) \subset L(\infty)$,
- (ii) $B(\infty)$ is a basis of $L(\infty)/qL(\infty)$,
- (iii) $\tilde{f}_i B(\infty) \subset B(\infty)$ and $\tilde{e}_i B(\infty) \subset B(\infty) \cup \{0\}$.

We call $(L(\infty), B(\infty))$ the crystal basis of $U_q^-(\mathfrak{g})$.

Let $\bar{}$ be the automorphism of \mathbf{K} sending q to q^{-1} . Then $\overline{\mathbf{A}_0}$ coincides with \mathbf{A}_∞ .

Let V be a vector space over \mathbf{K} , L_0 an \mathbf{A} -submodule of V , L_∞ an \mathbf{A}_∞ -submodule, and $V_{\mathbf{A}}$ an \mathbf{A} -submodule. Set $E := L_0 \cap L_\infty \cap V_{\mathbf{A}}$.

Definition 2.5 ([Kas]). *We say that (L_0, L_∞, V_A) is balanced if each of L_0 , L_∞ and V_A generates V as a \mathbf{K} -vector space, and if one of the following equivalent conditions is satisfied.*

- (i) $E \rightarrow L_0/qL_0$ is an isomorphism,
- (ii) $E \rightarrow L_\infty/q^{-1}L_\infty$ is an isomorphism,
- (iii) $(L_0 \cap V_A) \oplus (q^{-1}L_\infty \cap V_A) \rightarrow V_A$ is an isomorphism.
- (iv) $A_0 \otimes_{\mathbf{Q}} E \rightarrow L_0$, $A_\infty \otimes_{\mathbf{Q}} E \rightarrow L_\infty$, $A \otimes_{\mathbf{Q}} E \rightarrow V_A$ and $\mathbf{K} \otimes_{\mathbf{Q}} E \rightarrow V$ are isomorphisms.

Let $-$ be the ring automorphism of $U_q(\mathfrak{g})$ sending q , t_i , e_i , f_i to q^{-1} , t_i^{-1} , e_i , f_i .

Let $U_q(\mathfrak{g})_A$ be the A -subalgebra of $U_q(\mathfrak{g})$ generated by $e_i^{(n)}$, $f_i^{(n)}$ and t_i . Similarly we define $U_q^-(\mathfrak{g})_A$.

Theorem 2.6. $(L(\infty), \overline{L(\infty)}, U_q^-(\mathfrak{g})_A)$ is balanced.

Let

$$G^{\text{low}}: L(\infty)/qL(\infty) \xrightarrow{\sim} E := L(\infty) \cap \overline{L(\infty)} \cap U_q^-(\mathfrak{g})_A$$

be the inverse of $E \xrightarrow{\sim} L(\infty)/qL(\infty)$. Then $\{G^{\text{low}}(b) \mid b \in B(\infty)\}$ forms a basis of $U_q^-(\mathfrak{g})$. We call it a (lower) *global basis*. It is first introduced by G. Lusztig ([L]) under the name of “canonical basis” for the A, D, E cases.

Definition 2.7. *Let*

$$\{G^{\text{up}}(b) \mid b \in B(\infty)\}$$

be the dual basis of $\{G^{\text{low}}(b) \mid b \in B(\infty)\}$ with respect to the inner product (\cdot, \cdot) . We call it the upper global basis of $U_q^-(\mathfrak{g})$.

2.3. Review on the PBW basis. In the sequel, we set $I = \mathbb{Z}_{\text{odd}}$ and

$$(\alpha_i, \alpha_j) = \begin{cases} 2 & \text{for } i = j, \\ -1 & \text{for } j = i \pm 2, \\ 0 & \text{otherwise,} \end{cases}$$

and we consider the corresponding quantum group $U_q(\mathfrak{gl}_\infty)$. In this case, we can parametrize the crystal basis $B(\infty)$ by the multisegments. We shall recall this parametrization and the PBW basis.

Definition 2.8. *For $i, j \in I$ such that $i \leq j$, we define a segment $\langle i, j \rangle$ as the interval $[i, j] \subset \mathbb{Z}_{\text{odd}}$. A multisegment is a formal finite sum of segments:*

$$\mathbf{m} = \sum_{i \leq j} m_{ij} \langle i, j \rangle$$

with $m_{i,j} \in \mathbb{Z}_{\geq 0}$. If $m_{i,j} > 0$, we sometimes say that $\langle i, j \rangle$ appears in \mathbf{m} . We denote sometimes $\langle i \rangle$ for $\langle i, i \rangle$. We denote by \mathcal{M} the set of multisegments. We denote by \emptyset the zero element (or the empty multisegment) of \mathcal{M} .

Definition 2.9. *For two segments $\langle i_1, j_1 \rangle$ and $\langle i_2, j_2 \rangle$, we define the ordering \geq_{PBW} by the following:*

$$\langle i_1, j_1 \rangle \geq_{\text{PBW}} \langle i_2, j_2 \rangle \iff \begin{cases} j_1 > j_2 \\ \text{or} \\ j_1 = j_2 \text{ and } i_1 \geq i_2. \end{cases}$$

We call this ordering the PBW ordering.

Example 2.10. *We have $\langle 1, 1 \rangle >_{\text{PBW}} \langle -1, 1 \rangle >_{\text{PBW}} \langle -1, -1 \rangle$.*

Definition 2.11. We define the element $P(\mathbf{m}) \in U_q^-(\mathfrak{gl}_\infty)$ indexed by a multisegment \mathbf{m} as follows:

(1) for a segment $\langle i, j \rangle$, we define the element $\langle i, j \rangle \in U_q^-(\mathfrak{gl}_\infty)$ inductively by

$$\begin{aligned} \langle i, i \rangle &= f_i, \\ \langle i, j \rangle &= \langle i, j-2 \rangle \langle j, j \rangle - q \langle j, j \rangle \langle i, j-2 \rangle, \end{aligned}$$

(2) for a multisegment $\mathbf{m} = \sum_{i \leq j} m_{ij} \langle i, j \rangle$, we define

$$P(\mathbf{m}) = \overrightarrow{\prod} \langle i, j \rangle^{(m_{ij})}.$$

Here the product $\overrightarrow{\prod}$ is taken over segments appearing in \mathbf{m} from large to small with respect to the PBW ordering. The element $\langle i, j \rangle^{(m_{ij})}$ is the divided power of $\langle i, j \rangle$ i.e.

$$\langle i, j \rangle^{(m_{ij})} = \frac{1}{[m_{ij}]!} \langle i, j \rangle^{m_{ij}}.$$

Set $\text{wt } P(\mathbf{m}) = - \sum_{i \leq j} m_{ij} \alpha_{ij}$.

Theorem 2.12 ([L]). The set of elements $\{P(\mathbf{m}) \mid \mathbf{m} \in \mathcal{M}\}$ is a basis of the \mathbf{K} -vector space $U_q^-(\mathfrak{gl}_\infty)$. Moreover this is a basis of the \mathbf{A} -module $U_q^-(\mathfrak{gl}_\infty)_{\mathbf{A}}$. We call this basis the PBW basis of $U_q^-(\mathfrak{gl}_\infty)$.

Definition 2.13. For two segments $\langle i_1, j_1 \rangle$ and $\langle i_2, j_2 \rangle$, we define the ordering \geq_{cry} by the following:

$$\langle i_1, j_1 \rangle \geq_{\text{cry}} \langle i_2, j_2 \rangle \Leftrightarrow \begin{cases} j_1 > j_2 \\ \text{or} \\ j_1 = j_2 \text{ and } i_1 \leq i_2. \end{cases}$$

We call this ordering the crystal ordering. For $\mathbf{m} = \sum_{i \leq j} m_{i,j} \langle i, j \rangle \in \mathcal{M}$ and $\mathbf{m}' = \sum_{i \leq j} m'_{i,j} \langle i, j \rangle \in \mathcal{M}$, we define $\mathbf{m}' <_{\text{cry}} \mathbf{m}$ if there exists a segment $\langle i_0, j_0 \rangle$ such that $m'_{i_0, j_0} < m_{i_0, j_0}$ and $m'_{i,j} = m_{i,j}$ for any $\langle i, j \rangle >_{\text{cry}} \langle i_0, j_0 \rangle$.

Example 2.14. The crystal ordering is different from the PBW ordering. For example, we have $\langle -1, 1 \rangle >_{\text{cry}} \langle 1, 1 \rangle >_{\text{cry}} \langle -1, -1 \rangle$, while we have $\langle 1, 1 \rangle >_{\text{PBW}} \langle -1, 1 \rangle >_{\text{PBW}} \langle -1, -1 \rangle$.

Definition 2.15. We define the crystal structure on \mathcal{M} as follows: for $\mathbf{m} = \sum m_{i,j} \langle i, j \rangle \in \mathcal{M}$ and $i \in I$, set $A_k^{(i)}(\mathbf{m}) = \sum_{k' \geq k} (m_{i,k'} - m_{i+2,k'+2})$ for $k \geq i$. Define $\varepsilon_i(\mathbf{m})$ as $\max \{A_k^{(i)}(\mathbf{m}) \mid k \geq i\} \geq 0$.

- (i) If $\varepsilon_i(\mathbf{m}) = 0$, then define $\tilde{e}_i(\mathbf{m}) = 0$. If $\varepsilon_i(\mathbf{m}) > 0$, let k_e be the largest $k \geq i$ such that $\varepsilon_i(\mathbf{m}) = A_k^{(i)}(\mathbf{m})$ and define $\tilde{e}_i(\mathbf{m}) = \mathbf{m} - \langle i, k_e \rangle + \delta_{k_e \neq i} \langle i+2, k_e \rangle$.
- (ii) Let k_f be the smallest $k \geq i$ such that $\varepsilon_i(\mathbf{m}) = A_k^{(i)}(\mathbf{m})$ and define $\tilde{f}_i(\mathbf{m}) = \mathbf{m} - \delta_{k_f \neq i} \langle i+2, k_f \rangle + \langle i, k_f \rangle$.

Remark 2.16. For $i \in I$, the actions of the operators \tilde{e}_i and \tilde{f}_i on $\mathbf{m} \in \mathcal{M}$ are also described by the following algorithm:

- Step 1. Arrange the segments in \mathbf{m} in the crystal ordering.
- Step 2. For each segment $\langle i, j \rangle$, write $-$, and for each segment $\langle i+2, j \rangle$, write $+$.
- Step 3. In the resulting sequence of $+$ and $-$, delete a subsequence of the form $+-$ and keep on deleting until no such subsequence remains.

Then we obtain a sequence of the form $-\dots-++\dots+$.

- (1) $\varepsilon_i(\mathbf{m})$ is the total number of $-$ in the resulting sequence.
- (2) $\tilde{f}_i(\mathbf{m})$ is given as follows:
 - (a) If the leftmost $+$ corresponds to a segment $\langle i+2, j \rangle$, then replace it with $\langle i, j \rangle$.
 - (b) If no $+$ exists, add a segment $\langle i, i \rangle$ to \mathbf{m} .
- (3) $\tilde{e}_i(\mathbf{m})$ is given as follows:
 - (a) If the rightmost $-$ corresponds to a segment $\langle i, j \rangle$, then replace it with $\langle i+2, j \rangle$.
 - (b) If no $-$ exists, then $\tilde{e}_i(\mathbf{m}) = 0$.

Theorem 2.17. (i) $L(\infty) = \bigoplus_{\mathbf{m} \in \mathcal{M}} A_0 P(\mathbf{m})$.

(ii) $B(\infty) = \{P(\mathbf{m}) \bmod qL(\infty) \mid \mathbf{m} \in \mathcal{M}\}$.

(iii) We have

$$\begin{aligned}\tilde{e}_i P(\mathbf{m}) &\equiv P(\tilde{e}_i(\mathbf{m})) \bmod qL(\infty), \\ \tilde{f}_i P(\mathbf{m}) &\equiv P(\tilde{f}_i(\mathbf{m})) \bmod qL(\infty).\end{aligned}$$

Note that \tilde{e}_i and \tilde{f}_i in the left-hand-side is the modified root operators.

(iv) We have the expansion

$$\overline{P(\mathbf{m})} \in P(\mathbf{m}) + \sum_{\substack{\mathbf{m}' < \mathbf{m} \\ \text{cry}}} AP(\mathbf{m}').$$

Therefore we can index the crystal basis by multisegments. By this theorem we can easily see by a standard argument that $(L(\infty), \overline{L(\infty)}, U_q^-(\mathfrak{g})_{\mathbf{A}})$ is balanced, and there exists a unique $G^{\text{low}}(\mathbf{m}) \in L(\infty) \cap U_q^-(\mathfrak{g})_{\mathbf{A}}$ such that $\overline{G^{\text{low}}(\mathbf{m})} = G^{\text{low}}(\mathbf{m})$ and $G^{\text{low}}(\mathbf{m}) \equiv P(\mathbf{m}) \bmod qL(\infty)$. The basis $\{G^{\text{low}}(\mathbf{m})\}_{\mathbf{m} \in \mathcal{M}}$ is a lower global basis.

3. REPRESENTATION THEORY OF \mathcal{H}_n^A AND THE LASCoux-LECLERC-THIBON-ARIKI THEORY

3.1. The affine Hecke algebra of type A .

Definition 3.1. For $p \in \mathbb{C}^*$, the affine Hecke algebra \mathcal{H}_n^A of type A is a \mathbb{C} -algebra generated by

$$T_1, \dots, T_{n-1}, X_1^{\pm 1}, \dots, X_n^{\pm 1}$$

satisfying the following defining relations:

- (1) $X_i X_j = X_j X_i$ for any $1 \leq i, j \leq n$.
- (2) [The braid relations of type A]

$$\begin{aligned}T_i T_{i+1} T_i &= T_{i+1} T_i T_{i+1} & (1 \leq i \leq n-2), \\ T_i T_j &= T_j T_i & (|i-j| > 1).\end{aligned}$$

- (3) [The Hecke relations]

$$(T_i - p)(T_i + p^{-1}) = 0 \quad (1 \leq i \leq n-1).$$

- (4) [The Bernstein-Lusztig relations]

$$\begin{aligned}T_i X_i T_i &= X_{i+1} & (1 \leq i \leq n-1), \\ T_i X_j &= X_j T_i & (j \neq i, i+1).\end{aligned}$$

Since we can embed \mathcal{H}_n^A into \mathcal{H}_{n+m}^A by $T_i \mapsto T_{i+m}$ ($1 \leq i \leq n-1$), $X_j \mapsto X_{m+j}$ ($1 \leq j \leq m$), we consider $\mathcal{H}_m^A \otimes \mathcal{H}_n^A$ as a subalgebra of \mathcal{H}_{n+m}^A .

Definition 3.2. For a finite-dimensional \mathcal{H}_n^A -module M , let

$$M = \bigoplus_{a \in (\mathbb{C}^*)^n} M_a$$

be the generalized eigenspace decomposition with respect to X_1, \dots, X_n . Here

$$M_a := \{u \in M \mid (X_i - a_i)^N u = 0 \text{ for any } 1 \leq i \leq n \text{ and } N \gg 0\}$$

for $a = (a_1, \dots, a_n) \in (\mathbb{C}^*)^n$.

- (1) We say that M is of type J if all the eigenvalues of X_1, \dots, X_n belong to $J \subset \mathbb{C}^*$.
- (2) Put

$$K_J^A := \bigoplus_{n \geq 0} K_{J,n}^A.$$

Here $K_{J,n}^A$ is the Grothendieck group of the abelian category of finite-dimensional \mathcal{H}_n^A -modules of type J .

- (3) The group \mathbb{Z} acts on \mathbb{C}^* by $\mathbb{Z} \ni n: a \mapsto ap^{2n}$.

Lemma 3.3. Let J_1 and J_2 be \mathbb{Z} -invariant subsets in \mathbb{C}^* such that $J_1 \cap J_2 = \emptyset$.

- (1) If M is an irreducible \mathcal{H}_m^A -module of type J_1 and N is an irreducible \mathcal{H}_n^A -module of type J_2 , then $\text{Ind}_{\mathcal{H}_m^A \otimes \mathcal{H}_n^A}^{\mathcal{H}_{m+n}^A}(M \otimes N)$ is irreducible of type $J_1 \cup J_2$.
- (2) Conversely, if L is an irreducible \mathcal{H}_n^A -module of type $J_1 \cup J_2$, then there exist m ($0 \leq m \leq n$), an irreducible \mathcal{H}_m^A -module M of type J_1 and an irreducible \mathcal{H}_{n-m}^A -module N of type J_2 such that L is isomorphic to $\text{Ind}_{\mathcal{H}_m^A \otimes \mathcal{H}_{n-m}^A}^{\mathcal{H}_n^A}(M \otimes N)$.

Hence in order to study the irreducible modules over the affine Hecke algebras of type A, it is enough to treat the irreducible modules of type J for an orbit J with respect to the \mathbb{Z} -action on \mathbb{C}^* .

3.2. The a -restriction and the a -induction. For a \mathbb{C} -algebra A , let us denote by $A\text{-mod}^{\text{fd}}$ the abelian category of finite-dimensional A -modules.

Definition 3.4. For $a \in \mathbb{C}^*$, let us define the functors

$$e_a: \mathcal{H}_n^A\text{-mod}^{\text{fd}} \rightarrow \mathcal{H}_{n-1}^A\text{-mod}^{\text{fd}}, \quad f_a: \mathcal{H}_n^A\text{-mod}^{\text{fd}} \rightarrow \mathcal{H}_{n+1}^A\text{-mod}^{\text{fd}}$$

by: $e_a M$ is the generalized a -eigenspace of M with respect to the action of X_n , and

$$f_a M := \text{Ind}_{\mathcal{H}_n^A \otimes \mathbb{C}[X_{n+1}^{\pm 1}]}^{\mathcal{H}_{n+1}^A} M \otimes \langle a \rangle,$$

where $\langle a \rangle$ is the 1-dimensional representation of $\mathbb{C}[X_{n+1}^{\pm 1}]$ defined by $X_{n+1} \mapsto a$.

Moreover, put

$$\tilde{e}_a M := \text{soc } e_a M, \quad \tilde{f}_a M := \text{cosoc } f_a M$$

for $a \in \mathbb{C}^*$. Here the socle is the maximal semisimple submodule and the cosocle is the maximal semisimple quotient module.

Theorem 3.5 (Grojnowski-Vazirani [GV]). Suppose M is irreducible. Then $\tilde{f}_a M$ is irreducible, and $\tilde{e}_a M$ is irreducible or 0 for any $a \in \mathbb{C}^*$.

3.3. LLTA type theorems for the affine Hecke algebra of type A . In this subsection, we consider the case

$$J = \{p^k \mid k \in \mathbb{Z}_{\text{odd}}\},$$

and suppose p is not a root of unity. For short, we shall write e_i, \tilde{e}_i, f_i and \tilde{f}_i for $e_{p^i}, \tilde{e}_{p^i}, f_{p^i}$ and \tilde{f}_{p^i} , respectively.

The LLTA type theorem for the affine Hecke algebra of type A consists of two parts. First is a labeling of finite-dimensional irreducible \mathcal{H}^A -modules by the crystal $B(\infty)$. Second is a description of some composition multiplicities by using the upper global basis.

Theorem 3.6 (Vazirani [V]). *There are complete representatives*

$$\{L_b \mid b \in B(\infty)\}$$

of the finite-dimensional irreducible \mathcal{H}^A -modules of type J such that

$$\tilde{e}_i L_b = L_{\tilde{e}_i b}, \quad \tilde{f}_i L_b = L_{\tilde{f}_i b}$$

for any $i \in I$.

Theorem 3.7 (Ariki [A]). *For $i \in I = \mathbb{Z}_{\text{odd}}$, let us define $e'_{i,b,b'}, f_{i,b,b'} \in \mathbb{C}[q, q^{-1}]$ by the coefficients of the expansions:*

$$e'_i G^{up}(b) = \sum_{b' \in B(\infty)} e'_{i,b,b'} G^{up}(b'), \quad f_i G^{up}(b) = \sum_{b' \in B(\infty)} f_{i,b,b'} G^{up}(b').$$

Then

$$[e_i L_b : L_{b'}] = e'_{i,b,b'}|_{q=1}, \quad [f_i L_b : L_{b'}] = f_{i,b,b'}|_{q=1}.$$

Here $[M : N]$ is the composition multiplicity of N in M on K_f^A .

Part II. The Symmetric Crystals and some LLTA Type Conjectures for Affine Hecke Algebra of Type B

4. GENERAL DEFINITIONS AND CONJECTURES FOR SYMMETRIC CRYSTALS

We follow the notations in subsection 2.1. Let θ be an automorphism of I such that $\theta^2 = \text{id}$ and $(\alpha_{\theta(i)}, \alpha_{\theta(j)}) = (\alpha_i, \alpha_j)$. Hence it extends to an automorphism of the root lattice Q by $\theta(\alpha_i) = \alpha_{\theta(i)}$, and induces an automorphism of $U_q(\mathfrak{g})$.

Definition 4.1. *Let $\mathcal{B}_\theta(\mathfrak{g})$ be the \mathbb{K} -algebra generated by E_i, F_i , and invertible elements T_i ($i \in I$) satisfying the following defining relations:*

- (i) *the T_i 's commute with each other,*
- (ii) *$T_{\theta(i)} = T_i$ for any i ,*
- (iii) *$T_i E_j T_i^{-1} = q^{(\alpha_i + \alpha_{\theta(i)}, \alpha_j)} E_j$ and $T_i F_j T_i^{-1} = q^{(\alpha_i + \alpha_{\theta(i)}, -\alpha_j)} F_j$ for $i, j \in I$,*
- (iv) *$E_i F_j = q^{-(\alpha_i, \alpha_j)} F_j E_i + (\delta_{i,j} + \delta_{\theta(i),j} T_i)$ for $i, j \in I$,*
- (v) *the E_i 's and the F_i 's satisfy the q -Serre relations.*

We set $E_i^{(n)} = E_i^n / [n]_i!$ and $F_i^{(n)} = F_i^n / [n]_i!$.

Proposition 4.2. *Let $\lambda \in P_+ := \{\lambda \in \text{Hom}(Q, \mathbb{Q}) \mid \langle \alpha_i^\vee, \lambda \rangle \in \mathbb{Z}_{\geq 0} \text{ for any } i \in I\}$ be a dominant integral weight such that $\theta(\lambda) = \lambda$.*

- (i) *There exists a $\mathcal{B}_\theta(\mathfrak{g})$ -module $V_\theta(\lambda)$ generated by a non-zero vector ϕ_λ such that*
 - (a) *$E_i \phi_\lambda = 0$ for any $i \in I$,*
 - (b) *$T_i \phi_\lambda = q^{(\alpha_i, \lambda)} \phi_\lambda$ for any $i \in I$,*
 - (c) *$\{u \in V_\theta(\lambda) \mid E_i u = 0 \text{ for any } i \in I\} = \mathbb{K} \phi_\lambda$.*

Moreover such a $V_\theta(\lambda)$ is irreducible and unique up to an isomorphism.

- (ii) there exists a unique symmetric bilinear form (\cdot, \cdot) on $V_\theta(\lambda)$ such that $(\phi_\lambda, \phi_\lambda) = 1$ and $(E_i u, v) = (u, F_i v)$ for any $i \in I$ and $u, v \in V_\theta(\lambda)$, and it is non-degenerate.
- (iii) There exists an endomorphism $-$ of $V_\theta(\lambda)$ such that $\overline{\phi_\lambda} = \phi_\lambda$ and $\overline{a\bar{v}} = \overline{a}v$, $\overline{F_i v} = F_i \bar{v}$ for any $a \in \mathbb{K}$ and $v \in V_\theta(\lambda)$.

The pair $(B_\theta(\mathfrak{g}), V_\theta(\lambda))$ is an analogue of $(\mathcal{B}(\mathfrak{g}), U_q^-(\mathfrak{g}))$. Such a $V_\theta(\lambda)$ is constructed as follows. Let $U_q^-(\mathfrak{g})\phi'_\lambda$ and $U_q^-(\mathfrak{g})\phi''_\lambda$ be a copy of a free $U_q^-(\mathfrak{g})$ -module. We give the structure of a $B_\theta(\mathfrak{g})$ -module on them as follows: for any $i \in I$ and $a \in U_q^-(\mathfrak{g})$

$$(4.1) \quad \begin{cases} T_i(a\phi'_\lambda) &= q^{(\alpha_i, \lambda)}(\text{Ad}(t_i t_{\theta(i)})a)\phi'_\lambda, \\ E_i(a\phi'_\lambda) &= (e'_i a + q^{(\alpha_i, \lambda)} \text{Ad}(t_i)(e_{\theta(i)}^* a))\phi'_\lambda, \\ F_i(a\phi'_\lambda) &= (f_i a)\phi'_\lambda \end{cases}$$

and

$$(4.2) \quad \begin{cases} T_i(a\phi''_\lambda) &= q^{(\alpha_i, \lambda)}(\text{Ad}(t_i t_{\theta(i)})a)\phi''_\lambda, \\ E_i(a\phi''_\lambda) &= (e'_i a)\phi''_\lambda, \\ F_i(a\phi''_\lambda) &= (f_i a + q^{(\alpha_i, \lambda)}(\text{Ad}(t_i)a)f_{\theta(i)})\phi''_\lambda. \end{cases}$$

Then there exists a unique $B_\theta(\mathfrak{g})$ -linear morphism $\psi: U_q^-(\mathfrak{g})\phi'_\lambda \rightarrow U_q^-(\mathfrak{g})\phi''_\lambda$ sending ϕ'_λ to ϕ''_λ . Its image $\psi(U_q^-(\mathfrak{g})\phi'_\lambda)$ is $V_\theta(\lambda)$.

Hereafter we assume further that

there is no $i \in I$ such that $\theta(i) = i$.

We conjecture that $V_\theta(\lambda)$ has a crystal basis. This means the following. Since E_i and F_i satisfy the q -boson relation $E_i F_i = q^{-(\alpha_i, \alpha_i)} F_i E_i + 1$, we define the modified root operators:

$$\tilde{E}_i(u) = \sum_{n \geq 1} F_i^{(n-1)} u_n \quad \text{and} \quad \tilde{F}_i(u) = \sum_{n \geq 0} F_i^{(n+1)} u_n,$$

when writing $u = \sum_{n \geq 0} F_i^{(n)} u_n$ with $E_i u_n = 0$. Let $L_\theta(\lambda)$ be the \mathbb{A}_0 -submodule of $V_\theta(\lambda)$ generated by $\tilde{F}_{i_1} \cdots \tilde{F}_{i_\ell} \phi_\lambda$ ($\ell \geq 0$ and $i_1, \dots, i_\ell \in I$), and let $B_\theta(\lambda)$ be the subset

$$\left\{ \tilde{F}_{i_1} \cdots \tilde{F}_{i_\ell} \phi_\lambda \bmod qL_\theta(\lambda) \mid \ell \geq 0, i_1, \dots, i_\ell \in I \right\}$$

of $L_\theta(\lambda)/qL_\theta(\lambda)$.

Conjecture 4.3. Let λ be a dominant integral weight such that $\theta(\lambda) = \lambda$.

- (1) $\tilde{F}_i L_\theta(\lambda) \subset L_\theta(\lambda)$ and $\tilde{E}_i L_\theta(\lambda) \subset L_\theta(\lambda)$,
- (2) $B_\theta(\lambda)$ is a basis of $L_\theta(\lambda)/qL_\theta(\lambda)$,
- (3) $\tilde{F}_i B_\theta(\lambda) \subset B_\theta(\lambda)$, and $\tilde{E}_i B_\theta(\lambda) \subset B_\theta(\lambda) \sqcup \{0\}$,
- (4) $\tilde{F}_i \tilde{E}_i(b) = b$ for any $b \in B_\theta(\lambda)$ such that $\tilde{E}_i b \neq 0$, and $\tilde{E}_i \tilde{F}_i(b) = b$ for any $b \in B_\theta(\lambda)$.

Moreover we conjecture that $V_\theta(\lambda)$ has a global crystal basis. Namely we have

Conjecture 4.4. $(L_\theta(\lambda), \overline{L_\theta(\lambda)}, V_\theta(\lambda)_\mathbb{A}^{\text{low}})$ is balanced. Here $V_\theta(\lambda)_\mathbb{A}^{\text{low}} := U_q^-(\mathfrak{g})_\mathbb{A} \phi_\lambda$.

The dual version is as follows. As in [Kas], we have

Lemma 4.5. Assume Conjecture 4.3. Then we have

- (i) $L_\theta(\lambda) = \{v \in V_\theta(\lambda) \mid (L_\theta(\lambda), v) \subset \mathbb{A}_0\}$,
- (ii) Let $(\cdot, \cdot)_0$ be the \mathbb{C} -valued symmetric bilinear form on $L_\theta(\lambda)/qL_\theta(\lambda)$ induced by (\cdot, \cdot) . Then $B_\theta(\lambda)$ is an orthonormal basis with respect to $(\cdot, \cdot)_0$.

Let us denote by $V_\theta(\lambda)_\mathbf{A}^{\text{up}}$ the dual space $\{v \in V_\theta(\lambda) \mid (V_\theta(\lambda)_\mathbf{A}^{\text{low}}, v) \in \mathbf{A}\}$. Then Conjecture 4.4 is equivalent to the following conjecture.

Conjecture 4.6. $(L_\theta(\lambda), c(L_\theta(\lambda)), V_\theta(\lambda)_\mathbf{A}^{\text{up}})$ is balanced.

Here c is a unique endomorphism of $V_\theta(\lambda)$ such that $c(\phi_\lambda) = \phi_\lambda$ and $c(av) = \bar{a}c(v)$, $c(E_i v) = E_i c(v)$ for any $a \in \mathbf{K}$ and $v \in V_\theta(\lambda)$. We have $(c(v'), v) = \overline{(v', \bar{v})}$ for any $v, v' \in V_\theta(\lambda)$.

Note that $V_\theta(\lambda)_\mathbf{A}^{\text{up}}$ is the largest \mathbf{A} -submodule M of $V_\theta(\lambda)$ such that M is invariant by the $E_i^{(n)}$'s and $M \cap \mathbf{K}\phi_\lambda = \mathbf{A}\phi_\lambda$.

By Conjecture 4.6, $L_\theta(\lambda) \cap c(L_\theta(\lambda)) \cap V_\theta(0)^{\text{up}} \rightarrow L_\theta(\lambda)/qL_\theta(\lambda)$ is an isomorphism. Let G_θ^{up} be its inverse. Then $\{G_\theta^{\text{up}}(b)\}_{b \in B_\theta(\lambda)}$ is a basis of $V_\theta(\lambda)$, which we call the *upper global basis* of $V_\theta(\lambda)$. Note that $\{G_\theta^{\text{up}}(b)\}_{b \in B_\theta(\lambda)}$ is the dual basis to $\{G_\theta^{\text{low}}(b)\}_{b \in B_\theta(\lambda)}$ with respect to the inner product of $V_\theta(\lambda)$.

5. SYMMETRIC CRYSTALS FOR \mathfrak{gl}_∞

In this section, we consider the case $\mathfrak{g} = \mathfrak{gl}_\infty$ and the Dynkin involution θ of I defined by $\theta(i) = -i$ for $i \in I = \mathbb{Z}_{\text{odd}}$.

We shall prove in this case Conjectures 4.3 and 4.4 for $\lambda = 0$.

We set

$$\tilde{V}_\theta(0) := B_\theta(\mathfrak{g}) / (\sum_i B_\theta(\mathfrak{g})E_i + \sum_i B_\theta(\mathfrak{g})(F_i - F_{\theta(i)})) \simeq U_q^-(\mathfrak{gl}_\infty) / \sum_i U_q^-(\mathfrak{gl}_\infty)(f_i - f_{\theta(i)}).$$

Since $F_i \phi_0'' = (f_i + f_{\theta(i)}) \phi_0'' = F_{\theta(i)} \phi_0''$, we have an epimorphism

$$(5.1) \quad \tilde{V}_\theta(0) \twoheadrightarrow V_\theta(0).$$

It is in fact an isomorphism (see Theorem 5.9).

5.1. θ -restricted multisegments.

Definition 5.1. If a multisegment \mathbf{m} has the form

$$\mathbf{m} = \sum_{-j \leq i \leq j} m_{ij} \langle i, j \rangle,$$

we call \mathbf{m} a θ -restricted multisegment. We denote by \mathcal{M}_θ the set of θ -restricted multisegments.

Definition 5.2. For a θ -restricted segment $\langle i, j \rangle$, we define its modified divided power by

$$\langle i, j \rangle^{[m]} = \begin{cases} \langle i, j \rangle^{(m)} = \frac{1}{[m]!} \langle i, j \rangle^m & (i \neq -j), \\ \frac{1}{\prod_{\nu=1}^m [2\nu]} \langle -j, j \rangle^m & (i = -j). \end{cases}$$

Definition 5.3. For $\mathbf{m} \in \mathcal{M}_\theta$, we define the elements $P_\theta(\mathbf{m}) \in U_q^-(\mathfrak{g}) \subset B_\theta(\mathfrak{g})$ by

$$P_\theta(\mathbf{m}) = \prod_{\langle i, j \rangle \in \mathbf{m}} \langle i, j \rangle^{[m_{ij}]}.$$

Here the product \prod is taken over the segments appearing in \mathbf{m} from large to small with respect to the PBW-ordering.

5.2. Crystal structure on \mathcal{M}_θ .

Definition 5.4. Suppose $k > 0$. For a θ -restricted multisegment $\mathbf{m} = \sum_{-j \leq i \leq j} m_{i,j} \langle i, j \rangle$, we set

$$\varepsilon_{-k}(\mathbf{m}) = \max \left\{ A_\ell^{(-k)}(\mathbf{m}) \mid \ell \geq -k \right\},$$

where

$$A_\ell^{(-k)}(\mathbf{m}) = \sum_{\ell' \geq \ell} (m_{-k, \ell'} - m_{-k+2, \ell'+2}) \quad \text{for } \ell > k,$$

$$A_k^{(-k)}(\mathbf{m}) = \sum_{\ell > k} (m_{-k, \ell} - m_{-k+2, \ell}) + 2m_{-k, k} + \delta(m_{-k+2, k} \text{ is odd}),$$

$$A_j^{(-k)}(\mathbf{m}) = \sum_{\ell > k} (m_{-k, \ell} - m_{-k+2, \ell}) + 2m_{-k, k} - 2m_{-k+2, k-2} + \sum_{-k+2 < i \leq j+2} m_{i, k} - \sum_{-k+2 < i \leq j} m_{i, k-2} \\ \text{for } -k+2 \leq j \leq k-2.$$

(i) Let n_f be the smallest $\ell \geq -k+2$, with respect to the ordering $\dots > k+2 > k > -k+2 > \dots > k-2$, such that $\varepsilon_{-k}(\mathbf{m}) = A_\ell^{(-k)}(\mathbf{m})$. We define

$$\tilde{F}_{-k}(\mathbf{m}) = \begin{cases} \mathbf{m} - \langle -k+2, n_f \rangle + \langle -k, n_f \rangle & \text{if } n_f > k, \\ \mathbf{m} - \langle -k+2, k \rangle + \langle -k, k \rangle & \text{if } n_f = k \text{ and } m_{-k+2, k} \text{ is odd,} \\ \mathbf{m} - \delta_{k \neq 1} \langle -k+2, k-2 \rangle + \langle -k+2, k \rangle & \text{if } n_f = k \text{ and } m_{-k+2, k} \text{ is even,} \\ \mathbf{m} - \delta_{n_f \neq k-2} \langle n_f+2, k-2 \rangle + \langle n_f+2, k \rangle & \text{if } -k+2 \leq n_f \leq k-2. \end{cases}$$

(ii) If $\varepsilon_{-k}(\mathbf{m}) = 0$, then $\tilde{E}_{-k}(\mathbf{m}) = 0$. If $\varepsilon_{-k}(\mathbf{m}) > 0$, then let n_e be the largest $\ell \geq -k+2$, with respect to the above ordering, such that $\varepsilon_{-k}(\mathbf{m}) = A_\ell^{(-k)}(\mathbf{m})$. We define

$$\tilde{E}_{-k}(\mathbf{m}) = \begin{cases} \mathbf{m} - \langle -k, n_e \rangle + \langle -k+2, n_e \rangle & \text{if } n_e > k, \\ \mathbf{m} - \langle -k, k \rangle + \langle -k+2, k \rangle & \text{if } n_e = k \text{ and } m_{-k+2, k} \text{ is even,} \\ \mathbf{m} - \langle -k+2, k \rangle + \delta_{k \neq 1} \langle -k+2, k-2 \rangle & \text{if } n_e = k \text{ and } m_{-k+2, k} \text{ is odd,} \\ \mathbf{m} - \langle n_e+2, k \rangle + \delta_{n_e \neq k-2} \langle n_e+2, k-2 \rangle & \text{if } -k+2 \leq n_e \leq k-2. \end{cases}$$

Remark 5.5. For $0 < k \in I$, the actions of \tilde{E}_{-k} and \tilde{F}_{-k} on $\mathbf{m} \in \mathcal{M}_\theta$ are described by the following algorithm.

Step 1. Arrange segments in \mathbf{m} of the form $\langle -k, j \rangle$ ($j \geq k$), $\langle -k+2, j \rangle$ ($j \geq k-2, 0$), $\langle i, k \rangle$ ($-k \leq i \leq k$), $\langle i, k-2 \rangle$ ($-k+2 \leq i \leq k-2$) in the order

$$\dots, \langle -k, k+2 \rangle, \langle -k+2, k+2 \rangle, \langle -k, k \rangle, \langle -k+2, k \rangle, \langle -k+2, k-2 \rangle, \\ \langle -k+4, k \rangle, \langle -k+4, k-2 \rangle, \dots, \langle k-2, k \rangle, \langle k-2, k-2 \rangle, \langle k \rangle.$$

Step 2. Write signatures for each segment appearing in \mathbf{m} by the following rules.

- (i) If a segment is not $\langle -k+2, k \rangle$, then
- For $\langle -k, k \rangle$, write --,
 - For $\langle -k, j \rangle$ with $j > k$, write -,
 - For $\langle -k+2, k-2 \rangle$ with $k > 1$, write ++,
 - For $\langle -k+2, j \rangle$ with $j > k$, write +,
 - For $\langle j, k \rangle$ if $-k < j \leq k$, write -,
 - For $\langle j, k-2 \rangle$ if $-k+2 < j \leq k-2$, write +,

• If otherwise, write no signature.

- (ii) For segments $m_{-k+2,k}\langle -k+2, k \rangle$, if $m_{-k+2,k}$ is even, then write no signature, and if $m_{-k+2,k}$ is odd, then write a sequence $-+$.

Step 3. In the resulting sequence of $+$ and $-$, delete a subsequence of the form $+--$ and keep on deleting until no such subsequence remains.

Then we obtain a sequence of the form $--\cdots-++\cdots+$.

(1) $\varepsilon_{-k}(\mathbf{m})$ is given as the total number of $-$ in the resulting sequence.

(2) $\tilde{F}_{-k}(\mathbf{m})$ is given as follows:

- (i) if the leftmost $+$ corresponds to a segment $\langle -k+2, j \rangle$ ($j > k$), then replace the segment with $\langle -k, j \rangle$,
- (ii) if the leftmost $+$ corresponds to a segment $\langle j, k-2 \rangle$, then replace the segment with $\langle j, k \rangle$,
- (iii) if the leftmost $+$ corresponds to segment $\langle -k+2, k \rangle^{m_{-k+2,k}}$, then replace one of the segments with $\langle -k, k \rangle$,
- (iv) if no $+$ exists, add a segment $\langle k, k \rangle$ to \mathbf{m} .

(3) $\tilde{E}_{-k}(\mathbf{m})$ is given as follows:

- (i) if the rightmost $-$ corresponds to a segment $\langle -k, j \rangle$, then replace the segment with $\langle -k+2, j \rangle$,
- (ii) if the rightmost $-$ corresponds to a segment $\langle j, k \rangle$ ($j \neq -k+2$), then replace the segment with $\langle j, k-2 \rangle$,
- (iii) if the rightmost $-$ corresponds to segments $m_{-k+2,k}\langle -k+2, k \rangle$, then replace one of the segment with $\langle -k+2, k-2 \rangle$,
- (iv) if no $-$ exists, then $\tilde{E}_{-k}(\mathbf{m}) = 0$.

Definition 5.6. For $k \in I_{>0}$, we define \tilde{F}_k , \tilde{E}_k and ε_k by the same rule as in Definition 2.15 for \tilde{f}_k and \tilde{e}_k .

Theorem 5.7. By \tilde{F}_k , \tilde{E}_k , ε_k ($k \in I$), \mathcal{M}_θ is a crystal, in the sense that, for any $k \in I$, we have

- (i) $\tilde{F}_k \mathcal{M}_\theta \subset \mathcal{M}_\theta$ and $\tilde{E}_k \mathcal{M}_\theta \subset \mathcal{M}_\theta \sqcup \{0\}$,
- (ii) $\tilde{F}_k \tilde{E}_k(\mathbf{m}) = \mathbf{m}$ if $\tilde{E}_k(\mathbf{m}) \neq 0$, and $\tilde{E}_k \circ \tilde{F}_k = \text{id}$,
- (iii) $\varepsilon_k(\mathbf{m}) = \max \{n \geq 0 \mid \tilde{E}^n(\mathbf{m}) \neq 0\} < \infty$ for any $\mathbf{m} \in \mathcal{M}_\theta$.

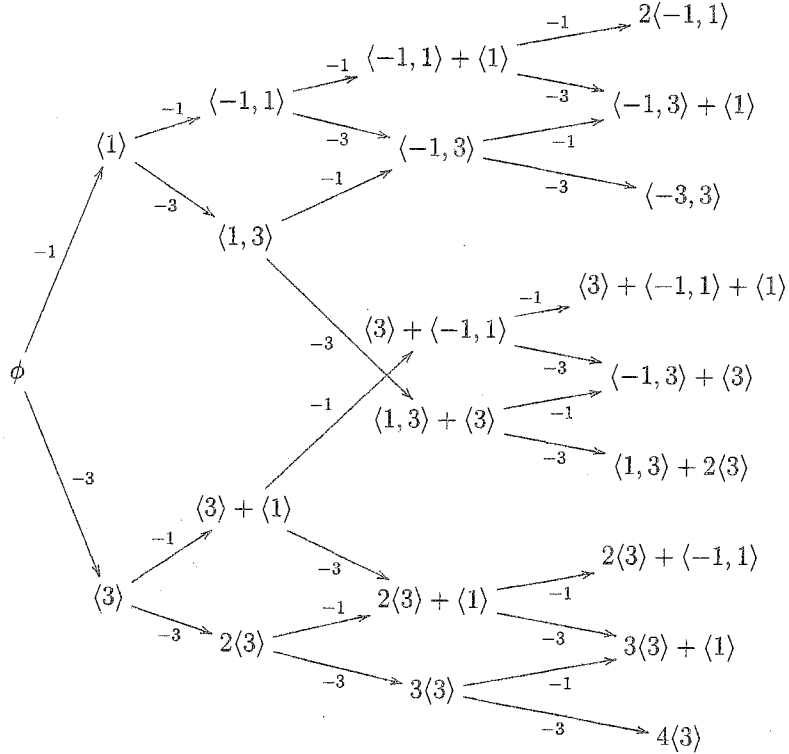

Example 5.8. (1) We shall write $\{a, b\}$ for $a\langle -1, 1 \rangle + b\langle 1 \rangle$. The following diagram is the part of the crystal graph of $B_\theta(0)$ that concerns only the 1-arrows and the (-1) -arrows.

Especially the part of (-1) -arrows is the following diagram.

$$\{0, 2n\} \xrightarrow{-1} \{0, 2n+1\} \xrightarrow{-1} \{1, 2n\} \xrightarrow{-1} \{1, 2n+1\} \xrightarrow{-1} \{2, 2n\} \xrightarrow{-1} \cdots$$

(2) The following diagram is the part of the crystal graph of $B_\theta(0)$ that concerns only the (-1) -arrows and the (-3) -arrows. This diagram is isomorphic as a graph to the crystal graph of A_2 .

(3) Here is the part of the crystal graph of $B_\theta(0)$ that concerns only the n -arrows and the $(-n)$ -arrows for an odd integer $n \geq 3$:

$$\phi \begin{matrix} \xrightarrow{n} \\ \xrightarrow{-n} \end{matrix} \langle n \rangle \begin{matrix} \xrightarrow{n} \\ \xrightarrow{-n} \end{matrix} 2\langle n \rangle \begin{matrix} \xrightarrow{n} \\ \xrightarrow{-n} \end{matrix} 3\langle n \rangle \begin{matrix} \xrightarrow{n} \\ \xrightarrow{-n} \end{matrix} 4\langle n \rangle \dots$$

5.3. Main Theorem. We write ϕ for the generator ϕ_0 of $V_\theta(0)$, for short.

Theorem 5.9. (i) The morphism

$$\tilde{V}_\theta(0) = U_q^-(\mathfrak{g}) / \sum_{k \in I} U_q^-(\mathfrak{g})(f_k - f_{-k}) \rightarrow V_\theta(0)$$

is an isomorphism.

(ii) $\{P_\theta(\mathbf{m})\phi\}_{\mathbf{m} \in \mathcal{M}_\theta}$ is a basis of the \mathbf{K} -vector space $V_\theta(0)$.

(iii) Set

$$L_\theta(0) := \sum_{\ell \geq 0, i_1, \dots, i_\ell \in I} A_0 \tilde{F}_{i_1} \dots \tilde{F}_{i_\ell} \phi \subset V_\theta(0),$$

$$B_\theta(0) = \left\{ \tilde{F}_{i_1} \dots \tilde{F}_{i_\ell} \phi \bmod qL_\theta(0) \mid \ell \geq 0, i_1, \dots, i_\ell \in I \right\}.$$

Then, $B_\theta(0)$ is a basis of $L_\theta(0)/qL_\theta(0)$ and $(L_\theta(0), B_\theta(0))$ is a crystal basis of $V_\theta(0)$, and the crystal structure coincide with the one of \mathcal{M}_θ .

(iv) More precisely, we have

- (a) $L_\theta(0) = \sum_{\mathbf{m} \in \mathcal{M}_\theta} \mathbb{A}_0 P_\theta(\mathbf{m})\phi$,
- (b) $B_\theta(0) = \{P_\theta(\mathbf{m})\phi \bmod qL_\theta(0) \mid \mathbf{m} \in \mathcal{M}_\theta\}$,
- (c) for any $k \in I$ and $\mathbf{m} \in \mathcal{M}_\theta$, we have
 - (1) $\tilde{F}_k P_\theta(\mathbf{m})\phi \equiv P_\theta(\tilde{F}_k \mathbf{m})\phi \bmod qL_\theta(0)$,
 - (2) $\tilde{E}_k P_\theta(\mathbf{m})\phi \equiv P_\theta(\tilde{E}_k \mathbf{m})\phi \bmod qL_\theta(0)$, where we understand $P_\theta(0) = 0$,
 - (3) $\tilde{E}_k^n P_\theta(\mathbf{m})\phi \in qL_\theta(0)$ if and only if $n > \varepsilon_k(\mathbf{m})$.

5.3.1. Global Basis of $V_\theta(0)$. Recall that $\mathbb{A} = \mathbb{Q}[q, q^{-1}]$, and $V_\theta(0)_\mathbb{A} = U_q^-(\mathfrak{gl}_\infty)_\mathbb{A}\phi$.

Lemma 5.10. (i) $V_\theta(0)_\mathbb{A} = \bigoplus_{\mathbf{m} \in \mathcal{M}_\theta} \mathbb{A}P_\theta(\mathbf{m})\phi$.

(ii) For $\mathbf{m} \in \mathcal{M}$,

$$\overline{P_\theta(\mathbf{m})\phi} \in P_\theta(\mathbf{m})\phi + \sum_{\substack{\mathbf{n} < \mathbf{m} \\ \text{cry}}} \mathbb{A}P_\theta(\mathbf{n})\phi.$$

By the above lemma, we obtain the following theorem.

Theorem 5.11. (i) $(L_\theta(0), \overline{L_\theta(0)}, V_\theta(0)_\mathbb{A})$ is balanced.

(ii) For any $\mathbf{m} \in \mathcal{M}_\theta$, there exists a unique $G_\theta^{\text{low}}(\mathbf{m}) \in L_\theta(0) \cap V_\theta(0)_\mathbb{A}$ such that $\overline{G_\theta^{\text{low}}(\mathbf{m})} = G_\theta^{\text{low}}(\mathbf{m})$ and $G_\theta^{\text{low}}(\mathbf{m}) \equiv P_\theta(\mathbf{m})\phi \bmod qL_\theta(0)$.

(iii) $G_\theta^{\text{low}}(\mathbf{m}) \in P_\theta(\mathbf{m})\phi + \sum_{\substack{\mathbf{n} < \mathbf{m} \\ \text{cry}}} q\mathbb{C}[q]P_\theta(\mathbf{n})\phi$ for any $\mathbf{m} \in \mathcal{M}_\theta$.

6. REPRESENTATION THEORY OF \mathcal{H}_n^B AND LLTA TYPE CONJECTURES

6.1. The affine Hecke algebra of type B .

Definition 6.1. For $p_0, p_1 \in \mathbb{C}^*$, the affine Hecke algebra \mathcal{H}_n^B of type B is a \mathbb{C} -algebra generated by

$$T_0, T_1, \dots, T_{n-1}, X_1^{\pm 1}, \dots, X_n^{\pm 1}$$

satisfying the following defining relations:

(i) $X_i X_j = X_j X_i$ for any $1 \leq i, j \leq n$.

(ii) [The braid relations of type B]

$$\begin{aligned} T_0 T_1 T_0 T_1 &= T_1 T_0 T_1 T_0, \\ T_i T_{i+1} T_i &= T_{i+1} T_i T_{i+1} \quad (1 \leq i \leq n-2), \\ T_i T_j &= T_j T_i \quad (|i-j| > 1). \end{aligned}$$

(iii) [The Hecke relations]

$$(T_0 - p_0)(T_0 + p_0^{-1}) = 0, \quad (T_i - p_1)(T_i + p_1^{-1}) = 0 \quad (1 \leq i \leq n-1).$$

(iv) [The Bernstein-Lusztig relations]

$$\begin{aligned} T_0 X_1^{-1} T_0 &= X_1, \\ T_i X_i T_i &= X_{i+1} \quad (1 \leq i \leq n-1), \\ T_i X_j &= X_j T_i \quad (j \neq i, i+1). \end{aligned}$$

Note that the subalgebra generated by T_i ($1 \leq i \leq n-1$) and $X_j^{\pm 1}$ ($1 \leq j \leq n$) is isomorphic to the affine Hecke algebra \mathcal{H}_n^A .

We assume that $p_0, p_1 \in \mathbb{C}^*$ satisfy

$$p_0^2 \neq 1, \quad p_1^2 \neq 1.$$

Let us denote by Pol_n the Laurent polynomial ring $\mathbb{C}[X_1^{\pm 1}, \dots, X_n^{\pm 1}]$, and by $\widetilde{\text{Pol}}_n$ its quotient field $\mathbb{C}(X_1, \dots, X_n)$. Then \mathcal{H}_n^B is isomorphic to the tensor product of Pol_n and

the subalgebra generated by the T_i 's that is isomorphic to the Hecke algebra of type B_n . We have

$$T_i a = (s_i a) T_i + (p_i - p_i^{-1}) \frac{a - s_i a}{1 - X^{-\alpha_i}} \quad \text{for } a \in \text{Pol}_n.$$

Here $p_i = p_1$ ($1 < i < n$), and $X^{-\alpha_i} = X_1^{-2}$ ($i = 0$) and $X^{-\alpha_i} = X_i X_{i+1}^{-1}$ ($1 \leq i < n$). The s_i 's are the Weyl group action on Pol_n : $(s_i a)(X_1, \dots, X_n) = a(X_1^{-1}, X_2, \dots, X_n)$ for $i = 0$ and $(s_i a)(X_1, \dots, X_n) = a(X_1, \dots, X_{i+1}, X_i, \dots, X_n)$ for $1 \leq i < n$.

Note that $\mathcal{H}_n^B = \mathbb{C}$ for $n = 0$.

The algebra \mathcal{H}_n^B acts faithfully on $\mathcal{H}_n^B / \sum_{i=0}^{n-1} \mathcal{H}_n^B (T_i - p_i) \simeq \text{Pol}_n$. Set

$$\varphi_i = (1 - X^{-\alpha_i}) T_i - (p_i - p_i^{-1}) \in \mathcal{H}_n^B$$

and

$$\tilde{\varphi}_i = (p_i^{-1} - p_i X^{-\alpha_i})^{-1} \varphi_i \in \widetilde{\text{Pol}}_n \otimes_{\text{Pol}_n} \mathcal{H}_n^B.$$

Then the action of $\tilde{\varphi}_i$ on Pol_n coincides with s_i . They are called *intertwiners*.

6.2. Block decomposition of \mathcal{H}_n^B -mod^{fd}. For $n, m \geq 0$, set

$$\mathbb{F}_{n,m} := \mathbb{C}[X_1^{\pm 1}, \dots, X_{n+m}^{\pm 1}, D^{-1}],$$

where

$$D := \prod_{1 \leq i \leq n < j \leq n+m} (X_i - p_1^2 X_j)(X_i - p_1^{-2} X_j)(X_i - p_1^2 X_j^{-1})(X_i - p_1^{-2} X_j^{-1})(X_i - X_j)(X_i - X_j^{-1}).$$

Then we can embed \mathcal{H}_n^B into $\mathcal{H}_{n+m}^B \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$ by

$$T_0 \mapsto \tilde{\varphi}_n \cdots \tilde{\varphi}_1 T_0 \tilde{\varphi}_1 \cdots \tilde{\varphi}_n, \quad T_i \mapsto T_{i+n} \quad (1 \leq i < m), \quad X_i \mapsto X_{i+n} \quad (1 \leq i \leq m).$$

Its image commute with $\mathcal{H}_n^B \subset \mathcal{H}_{n+m}^B$. Hence $\mathcal{H}_{n+m}^B \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$ is a right $\mathcal{H}_n^B \otimes \mathcal{H}_m^B$ -module. Note that $(\mathcal{H}_n^B \otimes \mathcal{H}_m^B) \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m} = \mathbb{F}_{n,m} \otimes_{\text{Pol}_{n+m}} (\mathcal{H}_n^B \otimes \mathcal{H}_m^B)$ is an algebra.

Lemma 6.2. $\mathcal{H}_{n+m}^A \otimes_{\mathcal{H}_n^A \otimes \mathcal{H}_m^A} (\mathcal{H}_n^B \otimes \mathcal{H}_m^B) \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m} \xrightarrow{\sim} \mathcal{H}_{n+m}^B \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$.

Proof. Let W_n^A and W_n^B be the finite Weyl group of type A and B . Note that $|W_{n+m}^A| \cdot |W_n^B| \cdot |W_m^B| / (|W_n^A| \cdot |W_m^A|) = |W_{n+m}^B|$. Hence the both sides are free modules of rank $|W_{n+m}^B|$ over $\mathbb{F}_{n,m}$. We prove that the map is surjective.

For short, we denote the image of $\mathcal{H}_{n+m}^A \otimes_{\mathcal{H}_n^A \otimes \mathcal{H}_m^A} (\mathcal{H}_n^B \otimes \mathcal{H}_m^B) \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$ by $\mathcal{H}_{n,m}^{\text{loc}} \subset$

$\mathcal{H}_{n+m}^B \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$. Note that $\tilde{\varphi}_i \cdots \tilde{\varphi}_n \in \mathcal{H}_{n+m}^A \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}$ for $1 \leq i \leq n$.

First, we have $\tilde{\varphi}_n \cdots \tilde{\varphi}_1 T_0 \tilde{\varphi}_1 \cdots \tilde{\varphi}_n \in \mathcal{H}_n^B \otimes_{\text{Pol}_n} \mathbb{F}_{n,m}$. Since $(\tilde{\varphi}_n \cdots \tilde{\varphi}_1)^{-1} = \tilde{\varphi}_1 \cdots \tilde{\varphi}_n \in \mathcal{H}_{n+m}^A \otimes_{\text{Pol}_n} \mathbb{F}_{n,m}$, we have $T_0 \tilde{\varphi}_1 \cdots \tilde{\varphi}_n \in \mathcal{H}_{n,m}^{\text{loc}}$.

Second, note that

$$T_i = (\tilde{\varphi}_i (p_i^{-1} - p_i X_i^{-1} X_{i+1}) - (p_i - p_i^{-1}) X_i^{-1} X_{i+1}) (1 - X_i^{-1} X_{i+1})^{-1} \quad (1 \leq i < n).$$

If $T_0 T_1 \cdots T_{i-1} \tilde{\varphi}_i \cdots \tilde{\varphi}_n \in \mathcal{H}_{n,m}^{\text{loc}}$, then $T_0 T_1 \cdots T_i \tilde{\varphi}_{i+1} \cdots \tilde{\varphi}_n \in \mathcal{H}_{n,m}^{\text{loc}}$ for $1 \leq i < n$. Indeed, we have

$$\begin{aligned} T_0 \cdots T_i \tilde{\varphi}_{i+1} \cdots \tilde{\varphi}_n &= T_0 \cdots T_{i-1} \tilde{\varphi}_i \cdots \tilde{\varphi}_n (p_i^{-1} - p_i X_i^{-1} X_{i+1}) (1 - X_i^{-1} X_{i+1})^{-1} \\ &\quad - (p_i - p_i^{-1}) T_0 \cdots T_{i-1} \tilde{\varphi}_{i+1} \cdots \tilde{\varphi}_n X_i^{-1} X_{i+1} (1 - X_i^{-1} X_{i+1})^{-1} \end{aligned}$$

and

$$T_0 \cdots T_{i-1} \tilde{\varphi}_{i+1} \cdots \tilde{\varphi}_n = \tilde{\varphi}_{i+1} \cdots \tilde{\varphi}_n T_0 \cdots T_{i-1} \in \mathcal{H}_{n+m}^A \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m} \mathcal{H}_n^B.$$

Therefore $T_0 T_1 \cdots T_n \in \mathcal{H}_{n,m}^{\text{loc}}$. Hence $T_0 T_1 \cdots T_i \in \mathcal{H}_{n,m}^{\text{loc}}$ ($1 \leq i < n+m$). Indeed, if $i < n$, then $T_0 T_1 \cdots T_i \in \mathcal{H}_n^B$. If $n \leq i$, then $T_0 T_1 \cdots T_n \in \mathcal{H}_{n,m}^{\text{loc}}$ and $T_{n+1} \cdots T_i \in \mathcal{H}_m^B$.

Finally, we prove the surjectivity by the induction on m . Note that

$$\mathcal{H}_{n+m}^B = \sum_{i=1}^{n+m} T_i T_{i+1} \cdots T_{n+m-1} \mathcal{H}_{n+m-1}^B + \sum_{i=0}^{n+m-1} T_i \cdots T_1 T_0 T_1 \cdots T_{n+m-1} \mathcal{H}_{n+m-1}^B$$

and $T_i T_{i+1} \cdots T_{n+m-1} \in \mathcal{H}_{n+m-1}^A$. Furthermore, $\mathcal{H}_{n+m-1}^B \subset \mathcal{H}_{n,m-1}^{\text{loc}}$ by the induction hypothesis. Thus it is sufficient to prove that $T_0 \mathcal{H}_{n+m}^{A,\text{fin}} \subset \mathcal{H}_{n,m}^{\text{loc}}$. Here, $\mathcal{H}_{n+m}^{A,\text{fin}}$ is the subalgebra of \mathcal{H}_{n+m}^A generated by T_1, \dots, T_{n+m-1} . This follows from

$$\mathcal{H}_{n+m}^{A,\text{fin}} = \sum_{i=0}^{n+m-1} \langle T_2, \dots, T_{n+m-1} \rangle T_1 T_2 \cdots T_i$$

and $T_0 T_1 \cdots T_i \in \mathcal{H}_{n,m}^{\text{loc}}$. □

Definition 6.3. For a finite-dimensional \mathcal{H}_n^B -module M , let

$$M = \bigoplus_{a \in (\mathbb{C}^*)^n} M_a$$

be the generalized eigenspace decomposition with respect to X_1, \dots, X_n :

$$M_a := \{u \in M \mid (X_i - a_i)^N u = 0 \text{ for any } 1 \leq i \leq n \text{ and } N \gg 0\}$$

for $a = (a_1, \dots, a_n) \in (\mathbb{C}^*)^n$.

(1) We say that M is of type J if all the eigenvalues of X_1, \dots, X_n belong to $J \subset \mathbb{C}^*$. Put

$$K_J^B := \bigoplus_{n \geq 0} K_{J,n}^B.$$

Here $K_{J,n}^B$ is the Grothendieck group of the abelian category of finite-dimensional \mathcal{H}_n^B -modules of type J .

- (2) The semi-direct product group $\mathbb{Z} \rtimes \mathbb{Z}_2 = \mathbb{Z} \times \{1, -1\}$ acts on \mathbb{C}^* by $(n, \epsilon): a \mapsto a^\epsilon p_1^{2n}$.
(3) Let J_1 and J_2 be $\mathbb{Z} \rtimes \mathbb{Z}_2$ -invariant subsets of \mathbb{C}^* such that $J_1 \cap J_2 = \emptyset$. Then for an \mathcal{H}_n^B -module N of type J_1 and an \mathcal{H}_m^B -module M of type J_2 , the action of Pol_{n+m} on $N \otimes M$ extends to an action of $\mathbb{F}_{n,m}$. We set

$$N \diamond M := (\mathcal{H}_{n+m}^B \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}) \otimes_{(\mathcal{H}_n^B \otimes \mathcal{H}_m^B) \otimes_{\text{Pol}_{n+m}} \mathbb{F}_{n,m}} (N \otimes M).$$

By the lemma above, $N \diamond M$ is isomorphic to $\text{Ind}_{\mathcal{H}_n^A \otimes \mathcal{H}_m^A}^{\mathcal{H}_{n+m}^A} (N \otimes M)$ as an \mathcal{H}_{n+m}^A -module.

Proposition 6.4. Let J_1 and J_2 be $\mathbb{Z} \rtimes \mathbb{Z}_2$ -invariant subsets of \mathbb{C}^* such that $J_1 \cap J_2 = \emptyset$.

- (1) Let N be an irreducible \mathcal{H}_n^B -module of type J_1 and M an irreducible \mathcal{H}_m^B -module of type J_2 . Then $N \diamond M$ is an irreducible \mathcal{H}_{n+m}^B -module of type $J_1 \cup J_2$.
(2) Conversely if L is an irreducible \mathcal{H}_n^B -module of type $J_1 \cup J_2$, then there exist an integer m ($0 \leq m \leq n$), an irreducible \mathcal{H}_m^B -module N of type J_1 and an irreducible \mathcal{H}_{n-m}^B -module M of type J_2 such that $L \simeq N \diamond M$.
(3) Assume that a $\mathbb{Z} \rtimes \mathbb{Z}_2$ -orbit J decomposes into $J = J_+ \sqcup J_-$ where J_\pm are \mathbb{Z} -orbits and $J_- = (J_+)^{-1}$. Assume that $\pm 1, \pm p_0 \notin J$. Then for any irreducible \mathcal{H}_n^B -module L of type J , there exists an irreducible \mathcal{H}_n^A -module M such that $L \simeq \text{Ind}_{\mathcal{H}_n^A}^{\mathcal{H}_n^B} M$.

Proof. (1) Let $(N \diamond M)_{J_1, J_2}$ be the generalized eigenspace, where the eigenvalues of X_i ($1 \leq i \leq n$) are in J_1 and the eigenvalues of X_j ($n < j \leq n+m$) are in J_2 . Then $(N \diamond M)_{J_1, J_2} = N \otimes M$ by $J_1 \cap J_2 = \emptyset$ by the above lemma and the shuffle lemma (e.g. [G, Lemma 5.5]). Suppose there exists non-zero \mathcal{H}_{n+m}^B -submodule S in $N \diamond M$. Then $S_{J_1, J_2} \neq 0$

as an $\mathcal{H}_n^B \otimes \mathcal{H}_m^B$ -module. Hence $S_{J_1, J_2} = N \otimes M$ by the irreducibility of $N \otimes M$ as an $\mathcal{H}_n^B \otimes \mathcal{H}_m^B$ -module. We obtain $S = N \diamond M$.

(2) For an irreducible \mathcal{H}_m^B -module L , the $\mathcal{H}_m^B \otimes \mathcal{H}_{n-m}^B$ -module L_{J_1, J_2} does not vanish for some m . Take an irreducible $\mathcal{H}_m^B \otimes \mathcal{H}_{n-m}^B$ -submodule S in L . Then there exist an irreducible \mathcal{H}_m^B -module N of type J_1 and an irreducible \mathcal{H}_{n-m}^B -module M of type J_2 such that $S = N \otimes M$. Hence there exists a surjective homomorphism $\text{Ind}(N \otimes M) = N \diamond M \rightarrow L$. Since $N \diamond M$ is irreducible, this is an isomorphism.

(3) See [M, Section 6]. □

Hence in order to study \mathcal{H}^B -modules, it is enough to study irreducible modules of type J for a $\mathbb{Z} \rtimes \mathbb{Z}_2$ -orbit J in \mathbb{C}^* such that J is a \mathbb{Z} -orbit or J contains one of $\pm 1, \pm p_0$.

6.3. The a -restriction and a -induction.

Definition 6.5. For $a \in \mathbb{C}^*$ and a finite-dimensional \mathcal{H}_n^B -module M , let us define the functors

$$E_a : \mathcal{H}_n^B\text{-mod}^{\text{fd}} \rightarrow \mathcal{H}_{n-1}^B\text{-mod}^{\text{fd}}, \quad F_a : \mathcal{H}_n^B\text{-mod}^{\text{fd}} \rightarrow \mathcal{H}_n^B\text{-mod}^{\text{fd}}$$

by: $E_a M$ is the generalized a -eigenspace of M with respect to the action of X_n , and

$$F_a M := \text{Ind}_{\mathcal{H}_n^B \otimes \mathbb{C}[X_{n+1}^{\pm 1}]}^{\mathcal{H}_{n+1}^B} M \otimes \langle a \rangle,$$

where $\langle a \rangle$ is the 1-dimensional representation of $\mathbb{C}[X_{n+1}^{\pm 1}]$ defined by $X_{n+1} \mapsto a$.

Define

$$\tilde{E}_a M := \text{soc } E_a M, \quad \tilde{F}_a M := \text{cosoc } F_a M$$

for $a \in \mathbb{C}^*$.

Theorem 6.6 (Miemietz [M]). *Suppose M is irreducible. Then $\tilde{F}_a M$ is irreducible and $\tilde{E}_a M$ is irreducible or 0 for any $a \in \mathbb{C}^* \setminus \{\pm 1\}$.*

6.4. LLTA type conjectures for type B. Now we take the case

$$J = \{p_1^k \mid k \in \mathbb{Z}_{\text{odd}}\}.$$

Assume that any of ± 1 and $\pm p_0$ is not contained in J . For short, we shall write E_i, \tilde{E}_i, F_i and \tilde{F}_i for $E_{p_1^i}, \tilde{E}_{p_1^i}, F_{p_1^i}$ and $\tilde{F}_{p_1^i}$, respectively.

Conjecture 6.7. (1) There are complete representatives

$$\{L_b \mid b \in B_\theta(0)\}$$

of the finite-dimensional irreducible \mathcal{H}^B -modules of type J such that

$$\tilde{E}_i L_b = L_{\tilde{E}_i b}, \quad \tilde{F}_i L_b = L_{\tilde{F}_i b}$$

for any $i \in I := \mathbb{Z}_{\text{odd}}$.

(2) For any $i \in \mathbb{Z}_{\text{odd}}$, let us define $E_{i,b,b'}, F_{i,b,b'} \in \mathbb{C}[q, q^{-1}]$ by the coefficients of the following expansions:

$$E_i G_\theta^{\text{up}}(b) = \sum_{b' \in B_\theta(0)} E_{i,b,b'} G_\theta^{\text{up}}(b'), \quad F_i G_\theta^{\text{up}}(b) = \sum_{b' \in B_\theta(0)} F_{i,b,b'} G_\theta^{\text{up}}(b').$$

Then

$$[E_i L_b : L_{b'}] = E_{i,b,b'}|_{q=1}, \quad [F_i L_b : L_{b'}] = F_{i,b,b'}|_{q=1}.$$

Here $[M : N]$ is the composition multiplicity of N in M on K_J^B .

Remark 6.8. There is a one-to-one correspondence between the above index set $B_\theta(0)$ and Syu Kato's parametrization ([Kat]) of irreducible representations of \mathcal{H}_n^B of type J .

Remark 6.9. (i) For conjectures for other $\mathbb{Z} \rtimes \mathbb{Z}_2$ -orbits J , see [EK1].

(ii) Similar conjectures for type D are presented by the second author and Vanessa Miemietz ([KM]).

Errata to "Symmetric crystals and affine Hecke algebras of type B, Proc. Japan Acad., 82, no. 8, 2006, 131–136" :

- (i) In Conjecture 3.8, $\lambda = \Lambda_{p_0} + \Lambda_{p_0^{-1}}$ should be read as $\lambda = \sum_{a \in A} \Lambda_a$, where $A = I \cap \{p_0, p_0^{-1}, -p_0, -p_0^{-1}\}$. We thank S. Ariki who informed us that the original conjecture is false.
- (ii) In the two diagrams of $B_\theta(\lambda)$ at the end of §2, λ should be 0.
- (iii) Throughout the paper, $A_\ell^{(1)}$ should be read as $A_{\ell-1}^{(1)}$.
