A High-Performance Inversion Framework for Brain Tumor Growth Models in Personalized Medicine

Shashank Subramanian
Klaudius Scheufele
Naveen Himthani
George Biros

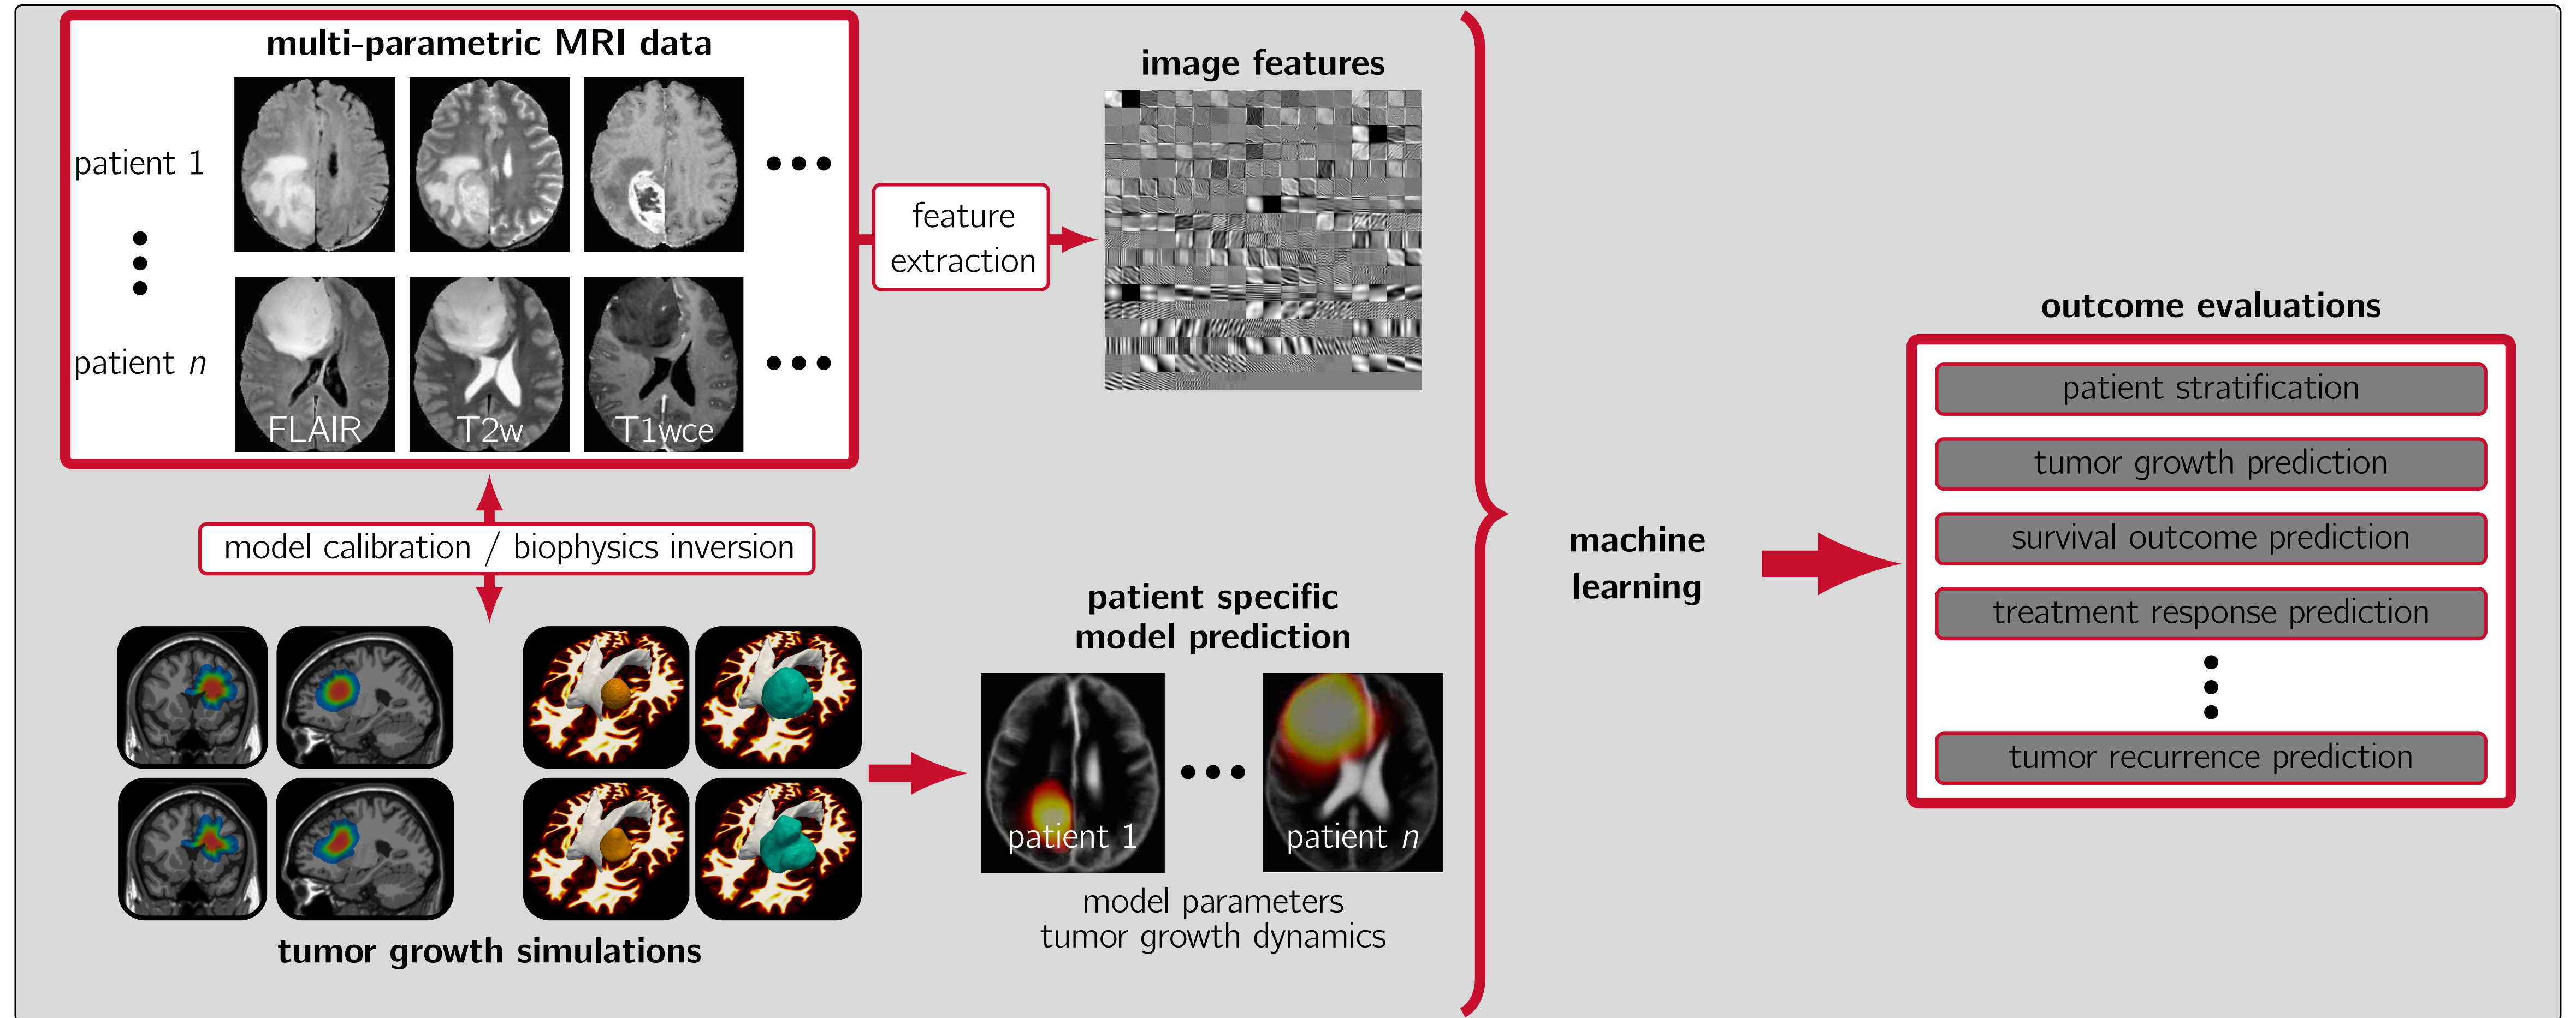

BIG PICTURE

- Brain cancer — aggressive tumors, poor prognosis, challenging to characterize
- *Data-informed* mathematical models of cancer growth hold an enormous promise
 - Explainable models that connect biophysics to clinical observables
 - Can assist in diagnosis and treatment planning
 - Provide a complete understanding of this complex dynamical system
- Our goal: an *end-to-end computational framework* to integrate cancer models with medical imaging data

AN END-TO-END FRAMEWORK

ALGORITHMS

- Multistage convolutional neural nets for semantic segmentation of MRIs
- Medical imaging data is sparse = a formidable large-scale non-convex inverse problem
 - Biophysically-inspired regularization strategies with sophisticated non-linear optimization algorithms
- Tumor growth models are complex PDEs = 3D non-linear forward problems
 - Fast spectral algorithms with efficient preconditioners

SOFTWARE

- Very expensive calculations — optimized software which exploits distributed memory parallelism and GPU-acceleration
 - Strong scaling efficiency $> 95\%$ up to 4000 CPU cores on the Frontera system
 - GPU-optimized computational kernels
- Inversion on clinical medical image data sizes can be done within 2 hours using the V100 GPUs on the Longhorn system; 5x faster than single node (48 cores) CPU performance.
