# State-of-the-art on Current Formalisms used in Cyber-Physical Systems Development

Rima Al-Ali, Moussa Amrani, Ankica Barisic, Fernando Barros,  
Dominique Blouin, Holger Giese, Miguel Goulão, Mauro Iacono, Eva  
Navarro, Hans Vangheluwe, Ken Vanherpen, Manuel Wimmer

Deliverable: WG1.1

## Core Team

University of Antwerp  
New University of Lisbon  
University of Malaga  
Hasso-Plattner Inst., Potsdam  
University of Twente  
fortiss GmbH, München  
University of Lisbon

## Document Info

Deliverable	WG1.1
Dissemination	Restricted
Status	Final
Doc's Lead Partner	Hasso-Plattner Inst.
Date	January 8, 2017
Version	2.0
Pages	61

# Contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
<b>2</b>	<b>Structured Catalog of Modeling Languages and Tools</b>	<b>3</b>
2.1	Introduction . . . . .	3
2.2	Formalisms . . . . .	4
2.2.1	AbstractStateMachines . . . . .	4
2.2.1.1	Implementing Languages . . . . .	4
2.2.1.2	References . . . . .	4
2.2.2	BayesianNetworks . . . . .	4
2.2.2.1	Implementing Languages . . . . .	4
2.2.2.2	References . . . . .	4
2.2.3	CTLSpecification . . . . .	4
2.2.3.1	Implementing Languages . . . . .	4
2.2.3.2	References . . . . .	5
2.2.4	CausalBlockDiagrams . . . . .	5
2.2.4.1	Implementing Languages . . . . .	5
2.2.4.2	References . . . . .	5
2.2.5	CellularAutomata . . . . .	5
2.2.5.1	Implementing Languages . . . . .	5
2.2.5.2	References . . . . .	5
2.2.6	DEECo . . . . .	5
2.2.6.1	Implementing Languages . . . . .	5
2.2.6.2	References . . . . .	5
2.2.7	DEECoSpecification . . . . .	5
2.2.7.1	Implementing Languages . . . . .	5
2.2.7.2	References . . . . .	6
2.2.8	DataFlow . . . . .	6
2.2.8.1	Implementing Languages . . . . .	6
2.2.8.2	References . . . . .	6
2.2.9	DataFlowTimed . . . . .	6
2.2.9.1	Implementing Languages . . . . .	7
2.2.9.2	References . . . . .	7
2.2.10	DifferentialEquations . . . . .	7
2.2.10.1	Implementing Languages . . . . .	7
2.2.10.2	References . . . . .	7
2.2.11	DiscreteEvent . . . . .	7

2.2.11.1 Implementing Languages . . . . .	7
2.2.11.2 References . . . . .	7
2.2.12 ElectricalLinearNetworks . . . . .	7
2.2.12.1 Implementing Languages . . . . .	7
2.2.12.2 References . . . . .	7
2.2.13 EntityRelationship . . . . .	8
2.2.13.1 Implementing Languages . . . . .	8
2.2.13.2 References . . . . .	8
2.2.14 Fault Trees . . . . .	8
2.2.14.1 Implementing Languages . . . . .	8
2.2.14.2 References . . . . .	8
2.2.15 FiniteStateProcess . . . . .	8
2.2.15.1 Implementing Languages . . . . .	8
2.2.15.2 References . . . . .	8
2.2.16 First Order Logic . . . . .	8
2.2.16.1 Implementing Languages . . . . .	8
2.2.16.2 References . . . . .	8
2.2.17 HyFlow (Hybrid Flow System Specification) . . . . .	8
2.2.17.1 Implementing Languages . . . . .	9
2.2.17.2 References . . . . .	9
2.2.18 DiscontinuousSystems . . . . .	9
2.2.18.1 Implementing Languages . . . . .	9
2.2.18.2 References . . . . .	9
2.2.19 HybridAutomata . . . . .	9
2.2.19.1 LinearHybridAutomata . . . . .	9
2.2.19.2 NonLinearHybridAutomata . . . . .	10
2.2.19.3 StochasticHybridAutomata . . . . .	10
2.2.19.4 TimedAutomata . . . . .	10
2.2.19.5 TimeAutomataPriced (Priced/Probabilistic Timed Automata (PTAs)) . . . . .	10
2.2.19.6 TimedAutomataStochastic . . . . .	10
2.2.19.7 I/O_Automata . . . . .	11
2.2.19.8 Implementing Languages . . . . .	11
2.2.19.9 References . . . . .	11
2.2.20 LabelledTransitionSystem . . . . .	11
2.2.20.1 Implementing Languages . . . . .	11
2.2.20.2 References . . . . .	11
2.2.21 LinearSignalFlow . . . . .	11
2.2.21.1 Implementing Languages . . . . .	11

2.2.21.2	References . . . . .	11
2.2.22	MarkovChains . . . . .	11
2.2.22.1	Implementing Languages . . . . .	12
2.2.22.2	References . . . . .	12
2.2.23	MessageDescriptionSpecification . . . . .	12
2.2.23.1	Implementing Languages . . . . .	12
2.2.23.2	References . . . . .	12
2.2.24	PetriNet . . . . .	12
2.2.24.1	Supported Extended Formalisms . . . . .	12
2.2.24.2	Supporting Tools . . . . .	13
2.2.24.3	References . . . . .	13
2.2.24.4	Implementing Languages . . . . .	13
2.2.24.5	References . . . . .	13
2.2.25	PetriNetColoured . . . . .	13
2.2.25.1	Implementing Languages . . . . .	13
2.2.25.2	References . . . . .	14
2.2.26	PetriNetDualistic . . . . .	14
2.2.26.1	Implementing Languages . . . . .	14
2.2.26.2	References . . . . .	14
2.2.27	PetriNetPrioritised . . . . .	14
2.2.27.1	Implementing Languages . . . . .	14
2.2.27.2	References . . . . .	14
2.2.28	PetriNetStochastic . . . . .	14
2.2.28.1	Implementing Languages . . . . .	14
2.2.28.2	References . . . . .	14
2.2.29	PetriNetTimed . . . . .	14
2.2.29.1	Implementing Languages . . . . .	14
2.2.29.2	References . . . . .	14
2.2.30	ProcessAlgebras . . . . .	14
2.2.30.1	Implementing Languages . . . . .	14
2.2.30.2	References . . . . .	15
2.2.31	TFPG (Timed Failure Propagation Graph) . . . . .	15
2.2.31.1	Implementing Languages . . . . .	15
2.2.31.2	References . . . . .	15
2.2.31.3	Implementing Languages . . . . .	15
2.2.31.4	References . . . . .	15
2.2.32	Complex Networks . . . . .	15
2.2.32.1	Implementing Languages . . . . .	15

2.2.32.2	References . . . . .	15
2.3	Languages . . . . .	15
2.3.1	AADL (Architecture Analysis and Design Language) . . . . .	15
2.3.1.1	Supported Formalisms . . . . .	16
2.3.1.2	Supporting Tools . . . . .	16
2.3.1.3	References . . . . .	16
2.3.2	ACME (Architecture Description Interchange Language) . . . . .	16
2.3.2.1	Supported Formalisms . . . . .	16
2.3.2.2	Supporting Tools . . . . .	16
2.3.2.3	References . . . . .	16
2.3.3	AML . . . . .	16
2.3.3.1	Supported Formalisms . . . . .	17
2.3.3.2	Supporting Tools . . . . .	17
2.3.3.3	References . . . . .	17
2.3.4	ATL . . . . .	17
2.3.4.1	Supported Formalisms . . . . .	17
2.3.4.2	Supporting Tools . . . . .	17
2.3.4.3	References . . . . .	17
2.3.5	AUTOSARLanguage (AUTomotive Open System ARchitecture) . . . . .	17
2.3.5.1	Supported Formalisms . . . . .	17
2.3.5.2	Supporting Tools . . . . .	17
2.3.5.3	References . . . . .	17
2.3.6	Alloy . . . . .	17
2.3.6.1	Supported Formalisms . . . . .	17
2.3.6.2	Supporting Tools . . . . .	17
2.3.6.3	References . . . . .	17
2.3.7	Artisan . . . . .	17
2.3.7.1	Supported Formalisms . . . . .	17
2.3.7.2	Supporting Tools . . . . .	18
2.3.7.3	References . . . . .	18
2.3.8	AsmL (Abstract State Machine Language) . . . . .	18
2.3.8.1	Supported Formalisms . . . . .	18
2.3.8.2	Supporting Tools . . . . .	18
2.3.8.3	References . . . . .	18
2.3.9	AsmetaL . . . . .	18
2.3.9.1	Supported Formalisms . . . . .	18
2.3.9.2	Supporting Tools . . . . .	18
2.3.9.3	References . . . . .	18

2.3.10 BlockDiagram . . . . .	18
2.3.10.1 Supported Formalisms . . . . .	18
2.3.10.2 Supporting Tools . . . . .	18
2.3.10.3 References . . . . .	19
2.3.11 BondGraph . . . . .	19
2.3.11.1 Supported Formalisms . . . . .	19
2.3.11.2 Supporting Tools . . . . .	19
2.3.11.3 References . . . . .	19
2.3.12 C . . . . .	19
2.3.12.1 Supported Formalisms . . . . .	19
2.3.12.2 Supporting Tools . . . . .	19
2.3.12.3 References . . . . .	19
2.3.13 C++ . . . . .	19
2.3.13.1 Supported Formalisms . . . . .	19
2.3.13.2 Supporting Tools . . . . .	19
2.3.13.3 References . . . . .	19
2.3.14 CCSL (Clock Constraint Specification Language) . . . . .	19
2.3.14.1 Supported Formalisms . . . . .	19
2.3.14.2 Supporting Tools . . . . .	19
2.3.14.3 References . . . . .	20
2.3.15 CDL (Context Description Language) . . . . .	20
2.3.15.1 Supported Formalisms . . . . .	20
2.3.15.2 Supporting Tools . . . . .	20
2.3.15.3 References . . . . .	20
2.3.16 CTL (Computation Tree Logic) . . . . .	20
2.3.16.1 Supported Formalisms . . . . .	20
2.3.16.2 Supporting Tools . . . . .	20
2.3.16.3 References . . . . .	20
2.3.17 Clafer . . . . .	20
2.3.17.1 Supported Formalisms . . . . .	20
2.3.17.2 Supporting Tools . . . . .	20
2.3.17.3 References . . . . .	21
2.3.18 CoCoME . . . . .	21
2.3.18.1 Supported Formalisms . . . . .	21
2.3.18.2 Supporting Tools . . . . .	21
2.3.18.3 References . . . . .	21
2.3.19 DEEC DSL (Dependable Emergent Ensembles of Component-Domain Specific Language) . . . . .	21
2.3.19.1 Supported Formalisms . . . . .	21

2.3.19.2 Supporting Tools . . . . .	21
2.3.19.3 References . . . . .	21
2.3.20 DSLTrans . . . . .	21
2.3.20.1 Supported Formalisms . . . . .	21
2.3.20.2 Supporting Tools . . . . .	21
2.3.20.3 References . . . . .	21
2.3.21 EAST-ADL . . . . .	21
2.3.21.1 Supported Formalisms . . . . .	22
2.3.21.2 Supporting Tools . . . . .	22
2.3.21.3 References . . . . .	22
2.3.22 ECL (Epsilon Comparison Language) . . . . .	22
2.3.22.1 Supported Formalisms . . . . .	22
2.3.22.2 Supporting Tools . . . . .	22
2.3.22.3 References . . . . .	22
2.3.23 EGL (Epsilon Generation Language) . . . . .	22
2.3.23.1 Supported Formalisms . . . . .	22
2.3.23.2 Supporting Tools . . . . .	22
2.3.23.3 References . . . . .	22
2.3.24 EML (Epsilon Merging Language) . . . . .	22
2.3.24.1 Supported Formalisms . . . . .	22
2.3.24.2 Supporting Tools . . . . .	22
2.3.24.3 References . . . . .	23
2.3.25 EOL (Epsilon Object Language) . . . . .	23
2.3.25.1 Supported Formalisms . . . . .	23
2.3.25.2 Supporting Tools . . . . .	23
2.3.25.3 References . . . . .	23
2.3.26 ERD (Entity Relationship Diagram) . . . . .	23
2.3.26.1 Supported Formalisms . . . . .	23
2.3.26.2 Supporting Tools . . . . .	23
2.3.26.3 References . . . . .	23
2.3.27 ETL (Epsilon Transformation Language) . . . . .	23
2.3.27.1 Supported Formalisms . . . . .	23
2.3.27.2 Supporting Tools . . . . .	23
2.3.27.3 References . . . . .	23
2.3.28 EVL (Epsilon Validation Language) . . . . .	23
2.3.28.1 Supported Formalisms . . . . .	23
2.3.28.2 Supporting Tools . . . . .	23
2.3.28.3 References . . . . .	24

2.3.29 EWL (Epsilon Wizard Language) . . . . .	24
2.3.29.1 Supported Formalisms . . . . .	24
2.3.29.2 Supporting Tools . . . . .	24
2.3.29.3 References . . . . .	24

<b>3 Glossary of Terms for Cyber Physical Systems</b>	<b>58</b>
<b>4 Summary and Future Work</b>	<b>60</b>
<b>Bibliography</b>	<b>61</b>

# 1 Introduction

This report on the State-of-the-art on Current Formalisms used in Cyber-Physical Systems Development of Working Group1 (WG1) on Foundations of the ICT COST Action IC1404 Multi-Paradigm Modelling for Cyber-Physical Systems (MPM4CPS) first presents a catalog of modeling languages and tools in chapter 2. Then a Glossary of Terms for Cyber Physical Systems is presented in chapter 3.

The work of WG1 revealed that the dependencies between the framework targeted in deliverable D1.2 Giese and Blouin (2016) and this report was much more tight than initially expected. To avoid capturing some content of this report in a redundant form in the ontologies of the framework, it was decided instead to include relevant information in the ontologies and extract it automatically from the ontologies for this report .

**Figure 1.1:** Overview of the structure of the MPM4CPS ontology

In figure 2.1 the structure of the framework and its elements in form of the different ontologies and their dependencies are presented. The figure also includes the data for the next two chapters of this report.

The first column depicts the framework and its ontologies as presented in the report on the Framework to Relate / Combine Modeling Languages and Techniques covered by deliverable D1.2 Giese and Blouin (2016). The Glossary of Terms for Cyber Physical Systems presented in chapter 3 of this report is extracted automatically from these ontologies and its contained concepts defining the framework.

In the second column the catalog of modeling languages and tools that consists of individuals of the MPM4CPS ontology as covered later in chapter 2 is presented. It is automatically derived from these individuals such that the ontology and its instances can be kept consistent with minimal coordination efforts.

In the third column, some examples for CPS development employing MPM in form of mega models are depicted. Those are presented in details in the report on the Framework to Relate / Combine Modeling Languages and Techniques covered by deliverable D1.2 Giese and Blouin

(2016). As depicted, these examples employ individuals of the catalog of languages and tools listed in this report in chapter 2 and instantiate the classes of the MPM4CPS ontology.

## 2 Structured Catalog of Modeling Languages and Tools

### 2.1 Introduction

A number of different tools is available that support multiparadigm modeling and/or CPS modeling, at different maturity level, designed by academia or industry. This richness is quite natural, for different reasons.

As first, CPS is a recent field, with no established standards and with different actors, each of which adopts a slightly different definition and a different approach for the topic: while multiparadigm modeling embraces a very wide spectrum of different topics, and actually has a very elastic and generic (informal) definition: the result is that tools were generated under different needs and from different directions, as the field spans from very theoretical, foundational approaches to very practical, application oriented approaches.

As second, this chaotic richness of tools is easily explained by the heterogeneity of users and backgrounds that are involved in the processes that are in the scope of interest of MPM4CPS that mirrors the intrinsic complexity of the systems that are in the scope of interest of MPM4CPS. They come from and work in different domains, each bringing the specialistic point of view, heritage and methods of their domain, they belong to different phases of the design, development and assessment cycle, or from different research fields, with different perspectives on the same problems and different views on the same systems. As a result, specifications of tools are often divergent, even if not contrasting, as they are driven by different purposes, towards different goals, and on different methodological foundations.

In this chapter a catalogue of tools is presented, with a classification that is derived from the ontology. Some of the tools are released as commercial software in support of different applications, others are pure experimental tools devoted to support research in language engineering or model engineering. For each tool the main points have been resumed and classified, in order to provide a comprehensive support for candidate users and to guide them in exploring the offer to find the best match to their needs.

The structure of the catalog is inspired from the framework proposed by Broman et al. (2012) (see figure 1) where modeling languages and tools may be based on / support a set of formalisms and conversely, formalisms may be implemented by languages and tools. Therefore, the catalog proposed three top level lists for languages, tools and formalisms with subsections for referencing the related elements via the aforementioned relations. In addition, for each element of the catalog a set of references is provided.

**Figure 2.1:** Framework for Viewpoints, Formalisms, Languages and Tools (from Broman et al. (2012))

### 2.2 Formalisms

The following subsections present the most commonly used formalisms for CPS development.

#### 2.2.1 AbstractStateMachines

*Reviewer(s): Soumy* The method built around the notion of Abstract State Machine (ASM) has been proved to be a scientifically well founded and an industrially viable method for the design and analysis of complex systems, which has been applied successfully to programming languages, protocols, embedded systems, architectures, requirements engineering, etc. The analysis covers both verification and validation, using mathematical reasoning (possibly theorem-prover-verified or model-checked) or experimental simulation (by running the executable models).

##### 2.2.1.1 Implementing Languages

AbstractStateMachines is a formalism for the following languages:

- AsmL (see section 2.3.8)

##### 2.2.1.2 References

<http://web.eecs.umich.edu/gasm/intro.html>

Borger (2005)

#### 2.2.2 BayesianNetworks

*Reviewer(s): Florin Leon*

Bayesian networks (BNs), also known as belief networks (or Bayes nets for short), belong to the family of probabilistic graphical models (GMs). These graphical structures are used to represent knowledge about an uncertain domain. In particular, each node in the graph represents a random variable, while the edges between the nodes represent probabilistic dependencies among the corresponding random variables. These conditional dependencies in the graph are often estimated by using known statistical and computational methods. Hence, BNs combine principles from graph theory, probability theory, computer science, and statistics.

##### 2.2.2.1 Implementing Languages

None

##### 2.2.2.2 References

Fuzzy Bayesian Networks: <http://perso.telecom-paristech.fr/~chollet/Biblio/Articles/Domaines/BayesianNet/fuzzy-bayesian-networks-a.pdf>

<http://www.cs.ubc.ca/~murphyk/Bayes/bnintro.html>

#### 2.2.3 CTLSpecification

*Reviewer(s): Didier Buchs, Soumy*

e.g. A CTL specification is given as a formula in the temporal logic CTL.

##### 2.2.3.1 Implementing Languages

CTLSpecification is a formalism for the following languages:

- CTL (see section 2.3.16)

### 2.2.3.2 References

### 2.2.4 CausalBlockDiagrams

*Reviewer(s): Hans?*

A Causal Block Diagram model is a graph made up of connected operation blocks. The connections stand for signals. Blocks can be purely algebraic such as Adder and Product, or may involve some notion of time such as Delay, Integrator and Derivative. Furthermore, Input and Output blocks are often used to model the system's connection to its environment.

#### 2.2.4.1 Implementing Languages

None

#### 2.2.4.2 References

### 2.2.5 CellularAutomata

*Reviewer(s): Florin Leon*

Cellular automata (CA) are an idealization of physical system in which space and time are discrete, and the physical quantities take into a finite set of values.

#### 2.2.5.1 Implementing Languages

None

#### 2.2.5.2 References

<http://plato.stanford.edu/entries/cellular-automata/>

### 2.2.6 DEEC

*Reviewer(s): Rima?* In scope of the ASCENS project have developed the DEEC component model (stands for Dependable Emergent Ensembles of Components) targeting design of systems consisting of autonomous, self-aware, and adaptable components. The components, implicitly organized in groups called ensembles, live in a very dynamic environment where a component can enter/exit an ensemble at any time. The goal of DEEC is to support development of applications in such a dynamic environment.

#### 2.2.6.1 Implementing Languages

DEEC is a formalism for the following languages:

- DEECDSL (see section 2.3.19)

#### 2.2.6.2 References

### 2.2.7 DEECSpecification

The main concepts of DEEC are heavily inspired by the concepts of the SCEL specification language. The main idea is to manage all the dynamism of the environment by externalizing the distributed communication between components to a component framework. The components access only local information and the distributed communication is performed implicitly by the framework. This way, the components have to be programmed as autonomous units, without relying on whether/how the distributed communication is performed, which makes them very robust and suitable for rapidly-changing environments.

#### 2.2.8 DataFlow

*Reviewer(s): Stefan, Etienne?* Synchronous Dataflow: Synchronous Dataflow (SDF) is a model of computation first proposed by Edward A. Lee in 1986. It describes an application as a graph where a node represents a function (usually called actor) and an arc represents a communication channel between two functions. All the inputs of a function must be present to start its execution, and the synchronous hypothesis states that the computation of each function and the communication between two functions is infinitely fast (or instantaneous).

Given this hypothesis, SDF provides a sound model of computation with predictable performance, properties verification methods (liveness, deadlock freedom), and predictable buffering.

The practical approach relies on the fact that the computation of a node starts only when the execution of all its predecessors is finished. This requires that the graph topology is loop-free. Since SDF are usually executed in periodic tasks, the synchronous hypothesis is usually considered to be verified as the worst case response time of the graph is smaller than the task's period.

This type of model is well-suited to digital signal processing and communications systems which often process an endless supply of data. It has been successfully applied in the domain of safety critical embedded systems. It has also been characterized or extended into homogeneous data flow graphs, cyclo-static data flow graphs, scenario-aware data flow graphs, affine data flow graphs.

#### 2.2.9 DataFlowTimed

*Reviewer(s): Stefan*

It's a Model of computation, not a formalism... perhaps we should move it to SystemC, but we don't have SystemC-AMS as language, so I'm not sure if we need this at all, if we don't describe SystemC-AMS

The Timed Data Flow (TDF) model of computation defined in the SystemC AMS 1.0 standard has already shown its value for signal-processing-oriented applications, such as RF communication and digital signal processing (DSP) systems, where the complex envelope of the modulated RF signal can be described as an equivalent baseband signal and where baseband algorithms are described naturally using data flow semantics. Because TDF is derived from the well-known Synchronous Data Flow (SDF) model of computation, high simulation performance can be obtained due to the calculation of a static schedule prior to simulation.

### 2.2.16 First Order Logic

*Author(s): Moussa Amrani Reviewer(s): Florin Leon*

First-Order Logic (abbreviated as FOL, and often referred to as First-Order Predicate Calculus) is a logical formalism constituted of terms and formulas. A term is either a variable, a function symbol or a predicate symbol. A formula is constituted of formulas built over terms combined with the usual Boolean operators (negation, conjunction and so on) and both existential and universal quantifiers. First-Order Logic formulas are interpreted on a (finite) domain, and possess a sound and complete calculus, making it automatable for reasoning Kleene (2002).

#### 2.2.16.1 Implementing Languages

FOL serves as the core formalisms for many tools, including:

### 2.2.17 HyFlow (Hybrid Flow System Specification)

*Reviewer(s): Fernando Barros, Eva Navaro*

The Hybrid Flow Systems Specification (HyFlow) provides a formal description of dynamic topology hybrid systems Barros (2003). This formalism can model systems that exhibit both

continuous and discrete behaviors while relying on a digital computer representation. HyFlow supports multisampling as a first order operator, enabling both time and component varying sampling, making it suitable for representing sampled-based systems, like digital controllers and filters. HyFlow provides also an extrapolation operator that enables an error free representation of continuous signals. Multisampling can be used for achieving an explicit representation of asynchronous adaptive stepsize differential equations solvers. HyFlow provides an integrative framework for combining models expressed in different modeling paradigms. In particular, fluid stochastic Petri-nets and geometric solvers, for example, can be represented in the HyFlow formalism, enabling its seamless integration with other HyFlow models. HyFlow sampling provides an expressive operator for making the connection of computer-based systems with real-time systems, since sampling is, in many cases, the most convenient operator to interact with continuous signals. HyFlow supports modular and hierarchical models providing deterministic semantics for model composition and co-simulation Barros (2008).

#### 2.2.18 DiscontinuousSystems

*Author(s): Eva Navarro*

Discontinuous or non-smooth systems are a subclass of hybrid systems. They are several types depending on the type of discontinuity in the model representing the system. We have two main classes: switching or variable structure systems, and jump or reset systems. Switching or variable structure systems are typically studied through the formalism of sliding motions (dynamics on the discontinuity surface) or sliding-mode-based control systems.

#### 2.2.19 HybridAutomata

*Reviewer(s): Eva Navarro*

A finite state automaton is a computational abstraction of the transitions of a system between discrete states or locations (on and off, for instance). A hybrid automaton, additionally, considers dynamical evolution over time in each location. This dynamical evolution is represented by a dynamical system. Depending on the nature of the dynamics of this system, different types of hybrid automata are defined; the main ones are explained as follows. Hybrid automata is one of the many existing representations of hybrid systems.

### 2.2.19.4 TimedAutomata

*Reviewer(s): Eva Navaro, Moussa Amrani*

In automata theory, a timed automaton is a finite automaton extended with a finite set of real-valued clocks. During a run of a timed automaton, clock values increase all with the same speed. Along the transitions of the automaton, clock values can be compared to integers. These comparisons form guards that may enable or disable transitions and by doing so constrain the possible behaviors of the automaton. Further, clocks can be reset. Timed automata are a subclass of a type hybrid automata.

Implementing Languages

References

### 2.2.19.5 TimeAutomataPriced (Priced/Probabilistic Timed Automata (PTAs))

*Reviewer(s): Eva Navaro, Moussa Amrani*

A priced timed automaton over  $X$  is an annotated directed graph with a distinguished vertex called the initial location. In the tradition of timed automata, we call vertices locations. An edge is decorated with a guard, an action and a reset set. We say that an edge is enabled if the guard evaluates to true and the source location is active. A reset set is a set of clocks. The intuition is that the clocks in the reset set are set to zero whenever the edge is taken.

### 2.2.24 PetriNet

Didier Buchs, Mauro Iacono, Soumy

A Petri net (also known as a place/transition net or P/T net) is one of several mathematical modeling languages for the description of distributed systems. Systems that are considered as discrete dynamic systems. A Petri net is a directed bipartite graph, in which the nodes represent transitions (i.e. events that may occur, represented by bars or black rectangles) and places (i.e. conditions, represented by circles). The directed arcs describe which places are pre- and/or postconditions for which transitions (signified by arrows). Some sources state that Petri nets were invented in August 1939 by Carl Adam Petri at the age of 13 for the purpose of describing chemical processes.

Like industry standards such as UML activity diagrams, Business Process Model and Notation and EPCs, Petri nets offer a graphical notation for stepwise processes that include choice, iteration, and concurrent execution. There are attempts for all these formalisms to have semantics in term of translation into Petri nets. Petri nets have an exact mathematical definition of their execution semantics, with a well-developed mathematical theory for process analysis.

It has been observed that in practice Petri Nets lack of modeling power for some modeling dimensions such as: timing aspects, data structures, stochastic processes and event priority. In general the formal analysis tool need different techniques if new modeling dimensions are introduced. So tools are generally different and adapted to the specific extensions.

### 2.2.24.1 Supported Extended Formalisms

Petri Nets have several extensions which are concretised in the following formalisms, it must be noted that the computing power can change according to these notations and then the analysability of the models:

- PetriNetPrioritised (Petri Net with priority) This simple extension bring new semantics to the transition firing in order to solve conflict. Depending on the variant it can lead to more powerful models which are Turing complete. (see section 2.2.27)

- PetriNetStochastic (Stochastic Petri Nets)(see section 2.2.28)
- PetriNetColoured (High level Petri nets) This large class rely on another modeling framework devoted to the description of the data attached to the tokens, and the expression that must be assigned to arcs describing the computation that must be done for satisfying the pre and post conditions. Among several dialect of these class we can cite algebraic Petri Nets and coloured Petri Nets (see section 2.2.25)
- PetriNetTimed (Time Petri Net or Timed Petri Net)(see section 2.2.29) These formalisms introduce time as a modeling dimension as transition duration or possible interval for firing transitions , generally these classes bring new problems for analysing them in particular the time line which has no limit in the future and the density of the time.
- PetriNetDualistic (see section 2.2.26)

#### 2.2.24.2 Supporting Tools

PetriNetLanguage and its variants is implemented by various tools, we can cite among the the following tools:

- Lola,
- TAPALL,
- GreatSPN,
- ORIS,
- Alpina, StrataGEM (see section 2.4.62)
- TINA\_SELT (see section 2.4.65)

In order to evaluate the power of these tools benchmarks have been proposed and are annually evaluated in a competition called the modeling contest. ?

#### 2.2.31 TFPG (Timed Failure Propagation Graph)

*Reviewer(s): Etienne Borde, Dominique Blouin, Rima Al Ali*

A Timed Failure Propagation Graph (TFPG) model is a relatively simple directed graph structure which identifies the paths along which failures are expected to propagate in the system. Nodes of a TFPG represent failure modes or discrepancies, and arcs represent failure propagation paths with a time interval representing the lower and upper bound of the failure propagation time. Logical operators AND and OR are used to represent logical combinations of failures to reach a mode and/or a discrepancy. TFPG can be used at design time to analyze faults propagation and their consequences. It can also be used at runtime to provide potential explanations to a fault signature that is observed during the system execution since consistency checking can be used to eliminate path on which timing constraints are not verified.

#### 2.2.32 Complex Networks

A complex network is a large number of interdependent systems connected in a nontrivial and non-regular manner. The interconnection of these systems produces emergent properties or behaviours which are not present in the isolated systems: this is called self-organisation, collective behaviour. There are different representations for complex networks. These models are typically based on graph theory (noded connected with links). The main models for complex networks are: random-graph networks, small-world networks, scale-free networks. Each of these models have different topological (structural) features, analysed with tools from statistical physics.

## 2.3.2 ACME (Architecture Description Interchange Language)

*Reviewer(s): Miguel Goulão*

There are several examples of Architectural Description Languages (ADLs), such as Aesop, Adage, C2, Darwin, Rapide, SADL, Unicon, MetaH, or Wright. While such ADLs considerably overlap on the core, each ADL focuses on different aspects of the software architecture and solving different categories of problems. This diversity raises difficulties in interchanging information among different ADLs. Providing an ADL which would support the features of all those ADLs would be impractical, and developing mappings among each pair of languages would require an excessive amount of effort. Acme was proposed as a generic language which can be used for expressing architectural concepts which are core to ADLs. The rationale was that rather than providing transformations between the different pairs of languages, Acme could be used as a common representation of architectural concepts to support the interchange of information reducing the number of required transformations to those to and from Acme.

Language Features:

- an architectural ontology consisting of seven basic architectural design elements;
- a flexible annotation mechanism supporting association of non-structural information using externally defined sublanguages;
- a type mechanism for abstracting common, reusable architectural idioms and styles; and
- an open semantic framework for reasoning about architectural descriptions.

### 2.3.2.1 Supported Formalisms

Acme's elements are formally defined in a relational representation in a constraint logic language (see Wile (1996)).

### 2.3.2.2 Supporting Tools

ACME is implemented by the following tools:

- AcmeStudio (see section 2.4.9)

### 2.3.2.3 References

### 2.3.16 CTL (Computation Tree Logic)

Computation tree logic (CTL) is a branching-time logic, meaning that its model of time is a tree-like structure in which the future is not determined; there are different paths in the future, any one of which might be an actual path that is realized. It is used in formal verification of software or hardware artifacts, typically by software applications known as model checkers which determine if a given artifact possesses safety or liveness properties. For example, CTL can specify that when some initial condition is satisfied (e.g., all program variables are positive or no cars on a highway straddle two lanes), then all possible executions of a program avoid some undesirable condition (e.g., dividing a number by zero or two cars colliding on a highway).

#### 2.3.16.1 Supported Formalisms

CTL is based on the following formalisms:

- CTLSpecification (see section 2.2.3)

### 2.3.18 CoCoME

The Common Component Modelling Example" Component-based software development (CBSD) has changed the current paradigm of software development. As systems become more and more complex, CBSD is to a greater extent applied in industry and plays a more and more important role in research. In order to leverage CBSD to build correct and dependable component-based systems, research has developed various formal and semi-formal component models. However, many of these component models like DisCComp, Fractal, Focus, or UML Extensions concentrate on different yet related aspects of component modelling. These are for instance communication issues or performance aspects. This hinders their validation for practical usage. Therefore, the main goal of the research seminar is to evaluate and compare the practical appliance of existing component models using a common component-based system as modelling example.

### 2.3.21 EAST-ADL

It is an Architecture Description Language (ADL) for automotive embedded systems, developed in several European research projects.

### 2.3.21.1 Supported Formalisms

None

### 2.3.21.2 Supporting Tools

None

### 2.3.21.3 References

### 2.3.22 ECL (Epsilon Comparison Language)

A rule-based language for discovering correspondences (matches) between elements of models of diverse metamodels.

#### 2.3.22.1 Supported Formalisms

None

#### 2.3.22.2 Supporting Tools

ECL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

#### 2.3.22.3 References

### 2.3.23 EGL (Epsilon Generation Language)

A template-based model-to-text language for generating code, documentation and other textual artefacts from models.

#### 2.3.23.1 Supported Formalisms

None

#### 2.3.23.2 Supporting Tools

EGL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

#### 2.3.23.3 References

### 2.3.24 EML (Epsilon Merging Language)

EML is a hybrid, rule-based language for merging homogeneous or heterogeneous models. As a merging language requires all the features of a transformation language (merging model A with an empty model into model B is equivalent to transforming  $A \rightarrow B$ ), EML reuses the syntax and semantics of ETL and extends it with concepts specific to model merging.

#### 2.3.24.1 Supported Formalisms

None

#### 2.3.24.2 Supporting Tools

EML is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

### 2.3.24.3 References

### 2.3.25 EOL (Epsilon Object Language)

An imperative model-oriented scripting language that combines the procedural style of Javascript with the powerful model querying capabilities of OCL.

#### 2.3.25.1 Supported Formalisms

None

#### 2.3.25.2 Supporting Tools

EOL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

#### 2.3.25.3 References

### 2.3.26 ERD (Entity Relationship Diagram)

An entity relationship diagram (ERD) shows the relationships of entity sets stored in a database. An entity in this context is a component of data. In other words, ER diagrams illustrate the logical structure of databases.

#### 2.3.26.1 Supported Formalisms

None

#### 2.3.26.2 Supporting Tools

ERD is implemented by the following tools:

- EclipseERD (see section 2.4.25)

#### 2.3.26.3 References

### 2.3.27 ETL (Epsilon Transformation Language)

A rule-based model-to-model transformation language that supports transforming many input to many output models, rule inheritance, lazy and greedy rules.

#### 2.3.27.1 Supported Formalisms

None

#### 2.3.27.2 Supporting Tools

ETL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

#### 2.3.27.3 References

### 2.3.28 EVL (Epsilon Validation Language)

A model validation language that supports both intra and inter-model consistency checking, and provides out-of-the-box integration with EMF & GMF editors.

#### 2.3.28.1 Supported Formalisms

None

#### 2.3.28.2 Supporting Tools

EVL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

### 2.3.28.3 References

### 2.3.29 EWL (Epsilon Wizard Language)

A language tailored for interactive in-place transformations on model elements selected by the user. EWL provides out-of-the-box integration with EMF & GMF editors

#### 2.3.29.1 Supported Formalisms

None

#### 2.3.29.2 Supporting Tools

EWL is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

### 2.3.29.3 References

### 2.3.30 EclipseEGL

EGL is a programming language conceptually similar to many common languages that have come before it. The language borrows concepts familiar to anyone using statically typed languages like Java, COBOL, C, etc. However, it borrows a concept from UML (Universal Modeling Language) that is not typically found in statically typed programming language ? the concept of Stereotype. In UML, stereotypes are used to tag UML elements with metadata (in this case, metadata refers to information about the UML element, for example, information about a UML element called a "class"). Constraints can be defined by stereotype definitions such that elements stereotyped by the given stereotype must adhere to the defined constraints of that stereotype. Stereotypes in UML are used as a lightweight mechanism to extend the standard modeling concepts. Stereotypes in EGL are essentially the same idea and are used to extend the basic EGL core language concepts.

#### 2.3.30.1 Supported Formalisms

None

#### 2.3.30.2 Supporting Tools

None

### 2.3.30.3 References

### 2.3.31 EpsilonFlock

Epsilon Flock is a model migration language built atop EOL, for updating models in response to metamodel changes. Flock provides a rule-based transformation language for specifying model migration strategies. A conservative copying algorithm automatically migrates model values and elements that are not affected by the metamodel changes.

#### 2.3.31.1 Supported Formalisms

None

#### 2.3.31.2 Supporting Tools

EpsilonFlock is implemented by the following tools:

- EclipseEpsilon (see section 2.4.26)

### 2.3.31.3 References

### 2.3.32 FIACRE

Fiacre stands for "Format Intermédiaire pour les Architectures de Composants Répartis Embarqués", french for "Intermediate Format for the Embedded Distributed Component Architectures". Fiacre is a formally defined language for representing compositionally both the behavioural and timing aspects of embedded and distributed systems for formal verification and simulation purposes.

#### 2.3.32.1 Supported Formalisms

FIACRE is based on the following formalisms:

- PetriNet (see section 2.2.24)
- PetriNetTimed (see section 2.2.29)
- TimedTransitionSystems (see section ??)

#### 2.3.32.2 Supporting Tools

FIACRE is implemented by the following tools:

- OBPEXplorer (see section 2.4.39)
- TINA\_SELT (see section 2.4.65)

### 2.3.32.3 References

### 2.3.33 FUMML (Foundational Subset for Executable UML Models)

This specification defines a subset of UML 2 and specifies foundational execution semantics for it. This subset will be referred to as Foundational UML or fUML. Conformance to this specification has two aspects: - Syntactic Conformance: A conforming model must be restricted to the abstract syntax subset defined for fUML. - Semantic Conformance: A conforming execution tool must provide execution semantics for a conforming model consistent with the semantics specified for fUML.

#### 2.3.33.1 Supported Formalisms

FUMML is based on the following formalisms:

- EntityRelationship (see section 2.2.13)

#### 2.3.33.2 Supporting Tools

None

### 2.3.33.3 References

### 2.3.34 IRM

IRM is a method and a corresponding model that allows for designing software-intensive Cyber-Physical Systems (siCPS) with a focus on dependability aspects. IRM is tailored for systems consisting of ensembles of components (e.g. DEECo-based systems), and provides a way to refine high-level system invariants into low-level system obligations, or equivalently to trace low-level system obligations to their rationale at the requirements space.

#### 2.3.34.1 Supported Formalisms

### 2.3.38 LTL (Linear Temporal Logic)

In logic, linear temporal logic or linear-time temporal logic (LTL) is a modal temporal logic with modalities referring to time. In LTL, one can encode formulae about the future of paths, e.g., a condition will eventually be true, a condition will be true until another fact becomes true,

etc. It is a fragment of the more complex CTL\*, which additionally allows branching time and quantifiers. Subsequently LTL is sometimes called propositional temporal logic, abbreviated PTL. Linear temporal logic (LTL) is a fragment of S1S.

### **2.3.39 MARTE (Modeling and Analysis of Real-Time and Embedded systems)**

This specification of a UML profile adds capabilities to UML for model-driven development of Real Time and Embedded Systems (RTES). This extension, called the UML profile for MARTE (in short MARTE for Modeling and Analysis of Real-Time and Embedded systems), provides support for specification, design, and verification/validation stages. This new profile is intended to replace the existing UML Profile for Schedulability, Performance and Time (formal/03-09-01).

#### **2.3.39.1 Supported Formalisms**

MARTE is based on the following formalisms:

- EntityRelationship (see section 2.2.13)

#### **2.3.39.2 Supporting Tools**

None

#### **2.3.39.3 References**

### **2.3.40 MTL (Model to Text Language)**

«TODO: Provide rdfs:comment annotation assertion»

#### **2.3.40.1 Supported Formalisms**

None

#### **2.3.40.2 Supporting Tools**

MTL is implemented by the following tools:

- Accelele (see section 2.4.8)

#### **2.3.40.3 References**

### **2.3.41 MessagesDescriptionLanguage**

ROS uses a simplified messages description language for describing the data values (aka messages) that ROS nodes publish. This description makes it easy for ROS tools to automatically generate source code for the message type in several target languages. Message descriptions are stored in .msg files in the msg/ subdirectory of a ROS package.

#### **2.3.41.1 Supported Formalisms**

MessagesDescriptionLanguage is based on the following formalisms:

- MessageDescriptionSpecification (see section 2.2.23)

### 2.3.41.2 Supporting Tools

MessagesDescriptionLanguage is implemented by the following tools:

- ROS (see section 2.4.51)

### 2.3.41.3 References

### 2.3.42 MetaH

Model tasks, subprograms, processes, and non-functional properties

### 2.3.48 OCL

Miguel Goulão

The Object Constraint Language (OCL) is a declarative language for describing rules that apply to Unified Modeling Language (UML) models developed at IBM and now part of the UML standard. Initially, OCL was only a formal specification language extension to UML. OCL may now be used with any Meta-Object Facility (MOF) Object Management Group (OMG) meta-model, including UML. The Object Constraint Language is a precise text language that provides constraint and object query expressions on any MOF model or meta-model that cannot otherwise be expressed by diagrammatic notation. OCL is a key component of the new OMG standard recommendation for transforming models, the Queries/Views/Transformations (QVT) specification.

#### 2.3.48.1 Supported Formalisms

None

### 2.3.48.2 Supporting Tools

The following tools support OCL:

- Eclipse OCL <https://projects.eclipse.org/projects/modeling.mdt.ocl>
- Papyrus <http://www.eclipse.org/papyrus/>

None

### 2.3.48.3 References

### 2.3.51 PRISMLanguage

In order to construct and analyse a model with PRISM, it must be specified in the PRISM language, a simple, state-based language, based on the Reactive Modules formalism of Alur and Henzinger. This is used for all of the types of model that PRISM supports: discrete-time Markov chains (DTMCs), continuous-time Markov chains (CTMCs), Markov decision processes (MDPs) and probabilistic timed automata (PTAs). For background material on these models, look at the pointers to resources on the PRISM web site.

#### 2.3.51.1 Supported Formalisms

PRISMLanguage is based on the following formalisms:

- MarkovChains (see section 2.2.22)
- TimeAutomataPriced (see section ??)

#### 2.3.51.2 Supporting Tools

PRISMLanguage is implemented by the following tools:

- PRISM (see section 2.4.46)

### 2.3.51.3 References

### 2.3.52 ParallelAssignmentLanguage

The input language of NuSMV is designed to allow the description of finite state systems that range from completely synchronous to completely asynchronous. The NuSMV language (like the language of SMV) provides for modular hierarchical descriptions and for the definition of reusable components. The basic purpose of the NuSMV language is to describe (using expressions in propositional calculus) the transition relation of a finite Kripke structure. This provides a great deal of flexibility, but at the same time it can introduce danger of inconsistency.

#### 2.3.52.1 Supported Formalisms

None

#### 2.3.52.2 Supporting Tools

ParallelAssignmentLanguage is implemented by the following tools:

- NuSMV (see section 2.4.38)

### 2.3.52.3 References

### 2.3.53 PetriNetLanguage

A Petri net (also known as a place/transition net or P/T net) is one of several mathematical modeling languages for the description of distributed systems. A Petri net is a directed bipartite graph, in which the nodes represent transitions (i.e. events that may occur, represented by bars) and places (i.e. conditions, represented by circles). The directed arcs describe which places are pre- and/or postconditions for which transitions (signified by arrows). Some sources state that Petri nets were invented in August 1939 by Carl Adam Petri at the age of 13 for the purpose of describing chemical processes.

Like industry standards such as UML activity diagrams, Business Process Model and Notation and EPCs, Petri nets offer a graphical notation for stepwise processes that include choice, iteration, and concurrent execution. Unlike these standards, Petri nets have an exact mathematical definition of their execution semantics, with a well-developed mathematical theory for process analysis.

#### 2.3.53.1 Supported Formalisms

PetriNetLanguage is based on the following formalisms:

- PetriNetPrioritised (see section 2.2.27)
- PetriNet (see section 2.2.24)
- PetriNetStochastic (see section 2.2.28)
- PetriNetColoured (see section 2.2.25)
- PetriNetTimed (see section 2.2.29)
- PetriNetDualistic (see section 2.2.26)

#### 2.3.53.2 Supporting Tools

PetriNetLanguage is implemented by the following tools:

- StrataGEM (see section 2.4.62)

### 2.3.55 Promela

PROMELA (Process or Protocol Meta Language) is a verification modeling language introduced by Gerard J. Holzmann. The language allows for the dynamic creation of concurrent processes to model, for example, distributed systems. In PROMELA models, communication via message channels can be defined to be synchronous (i.e., rendezvous), or asynchronous (i.e., buffered). PROMELA models can be analyzed with the SPIN model checker, to verify that the modeled system produces the desired behavior.

#### 2.3.55.1 Supported Formalisms

None

#### 2.3.55.2 Supporting Tools

Promela is implemented by the following tools:

- Spin (see section 2.4.60)

### 2.3.65 SystemCSpecification

*Reviewer(s): Stefan Klikovits, Dominique Blouin*

SystemC, an IEEE standardised Hardware Description Language (HDL)language Contrary to other HDLs (e.g. VHDL, Verilog), SystemC is not a complete language by itself, but rather a set of C++classes and macros, that allow the representation of HDL-concepts. SystemC includes built-in support for embedded concepts (e.g. mutex, semaphores, four-valued logic) and measures time in sub-second granularity (e.g. picosecond).

add to  
glossary

add nice  
style for  
the ++ in  
C++

The use of as a basis provides SystemC with flexibility and adaptability and models are written just as any other C++ code, specifying ports, signals and channels. Functionality is modelled using methods, which execute at predefined events and threads, which run continuously until they finish or temporarily seize execution (SystemC provides a simulation kernel that prescribes cooperative multi-threading).

Most functional tooling and verification support focuses on the generation and verification of Transaction-Level Modelling and Register-Transfer Level designs, which is too low-level for large CPS purposes that focus on the combination of many components.

SystemC's pragmatic approach as internal dsl is reflected in the absence of a formal semantics. However, several proposals have been made such as  $\lambda$  and  $\lambda$ , and there exist several approaches to formally verify SystemC, as discussed in  $\lambda$ .

### 2.3.65.1 Implementing Languages

SystemCSpecification is a formalism for the following languages:

- SystemC (see section 2.3.66)

### 2.3.66 SystemC

SystemC is a set of C++ classes and macros which provide an event-driven simulation interface (see also discrete event simulation). These facilities enable a designer to simulate concurrent processes, each described using plain C++ syntax. SystemC processes can communicate in a simulated real-time environment, using signals of all the datatypes offered by C++, some additional ones offered by the SystemC library, as well as user defined. In certain respects, SystemC deliberately mimics the hardware description languages VHDL and Verilog, but is more aptly described as a system-level modeling language.

### 2.3.66.1 Supported Formalisms

SystemC is based on the following formalisms:

- ElectricalLinearNetworks (see section 2.2.12)
- LinearSignalFlow (see section 2.2.21)
- DataFlowTimed (see section 2.2.9)
- SystemCSpecification (see section 2.3.65)

### 2.3.66.2 Supporting Tools

SystemC is implemented by the following tools:

- DIPLODOCUS (see section 2.4.19)

### 2.3.66.3 References

### 2.3.67 TCTL (Timed Computation Tree Logic)

Tt has Timed-constrained until

- TimedAutomataStochastic (see section ??)

#### 2.3.76.2 Supporting Tools

UPPAALSMCSpecificationLanguage is implemented by the following tools:

- UppaalSMC (see section 2.4.72)

#### 2.3.76.3 References

### 2.3.77 VDM-SL

VDM models are expressed in a specification language (VDM-SL) that supports the description of data and functionality. Data are defined by means of types built using constructors that

define structured data and collections such as sets, sequences and mappings from basic values such as Booleans and numbers. These types are very abstract, allowing the user to add any relevant constraints as data type invariants. Functionality is defined in terms of operations over these data types. Operations can be defined implicitly by preconditions and postconditions that characterize their behavior, or explicitly by means of specific algorithms. An extension of VDM-SL, called VDM++, supports object-oriented structuring of models and permits direct modeling of concurrency.

### 2.3.77.1 Supported Formalisms

None

### 2.3.77.2 Supporting Tools

VDM-SL is implemented by the following tools:

- Overture (see section 2.4.44)
- Crescendo (see section 2.4.17)

## 2.4 Tools

The following subsections present the most commonly used tools for CPS development.

### 2.4.1 20Sim

20-sim is a modeling and simulation program for mechatronic systems. With 20-sim you can enter model graphically, similar to drawing an engineering scheme. With these models you can simulate and analyze the behavior of multi-domain dynamic systems and create control systems. You can even generate C-code and run this code on hardware for rapid prototyping and HIL-simulation.

### 2.4.1.1 Supported Languages

None

### 2.4.1.2 References

### 2.4.2 AADLInspector

AADL Inspector is a model processing framework for AADL. Its aim is to provide an easy to use and extensible tool to perform static and dynamic analysis of AADL architectures, and to easily connect any AADL compliant verification tool or code generator.

#### 2.4.2.1 Supported Languages

None

#### 2.4.2.2 References

### 2.4.3 AF3

AF3 is a powerful open-source (Apache License) tool to develop embedded systems using models from the requirements to the hardware architecture, passing by the design of the logical architecture, the deployment and the scheduling. AF3 provides advanced features to support the user ensuring the quality of his/her system: formal analyses, synthesis methods, space exploration visualization...

#### 2.4.3.1 Supported Languages

None

#### 2.4.3.2 References

### 2.4.4 AMESim (AMESim (Advanced Modeling Environment for Simulations))

AMESim stands for Advanced Modeling Environment for performing Simulations of engineering systems. It is based on an intuitive graphical interface in which the system is displayed throughout the simulation process.

#### 2.4.4.1 Supported Languages

None

#### 2.4.4.2 References

### 2.4.5 AToM3

AToM3 is a tool for multi-paradigm modelling under development at the Modelling, Simulation and Design Lab (MSDL) in the School of Computer Science of McGill University. It is developed in close collaboration with Prof. Juan de Lara of the School of Computer Science, Universidad Aut noma de Madrid (UAM), Spain. AToM3 stands for "A Tool for Multi-formalism and Meta-Modelling".

#### 2.4.5.1 Supported Languages

None

#### 2.4.5.2 References

### 2.4.6 AToMPM

AToMPM stands for "A Tool for Multi-Paradigm Modeling". It is a research framework from which you can generate domain-specific modeling web-based tools that run on the cloud. AToMPM is an open-source framework for designing DSML environments, performing model

transformations, and manipulating and managing models. It runs completely over the web, making it independent from any operating system, platform, or device it may execute on. AToMPM follows the philosophy of modeling everything explicitly, at the right level of abstraction(s), using the most appropriate formalism(s) and process(es), being completely modeled by itself.

### 2.4.6.1 Supported Languages

None

### 2.4.6.2 References

### 2.4.7 AVATAR (AVATAR stands for Automated Verification of reAl Time softwARe.)

AVATAR stands for Automated Verification of reAl Time softwARe.

AVATAR targets the modeling and formal verification of real-time embedded systems.

The AVATAR profile reuses eight of the SysML diagrams (Package diagrams are not supported). AVATAR supports the following methodological phases:

**Requirement capture.** Requirements and properties are structured using AVATAR Requirement Diagrams. At this step, properties are just defined with a specific label.

**Assumption modeling.** Assumptions of system may be captured with an assumption modeling diagram, based on a SysML requirement diagram.

**System analysis.** A system may be analyzed using usual UML diagrams, such as Use Case Diagrams, Interaction Overview Diagrams (Supported by UML2, not by SysML) and Sequence Diagrams.

**System design.** The system is designed in terms of communicating SysML blocks described in an AVATAR Block Diagram, and in terms of behaviors described with AVATAR State Machines.

**Property modeling.** The formal semantics of properties is defined within TEPE Parametric Diagrams (PDs). Since TEPE PDs involve elements defined in system design (e.g, a given integer attribute of a block), TEPE PDs may be defined only after a first system design has been performed.

**Formal verification** can be conducted over the system design, and for each testcase defined in the Requirement Diagram.

**Code generation** can finally be used to generate a fully executable code. The latter can be compiled and executed on the SoCLib prototyping platform directly from TTool, or executed on your local host if the latter supports gcc and POSIX.

### 2.4.7.1 Supported Languages

None

### 2.4.7.2 References

### 2.4.8 Acceleo

Acceleo is a pragmatic implementation of the Object Management Group (OMG) MOF Model to Text Language (MTL) standard.

### 2.4.8.1 Supported Languages

None

### 2.4.8.2 References

### 2.4.9 AcmeStudio

*Reviewer(s): Miguel Goul  o*

AcmeStudio is a customizable editing environment and visualization tool for software architectural designs based on the Acme architectural description language (ADL). With AcmeStudio, you can define new Acme families and customize the environment to work with those families by defining diagram styles. AcmeStudio is an adaptable front-end that may be used in a variety of modeling and analysis applications. AcmeStudio is implemented as a plugin for Eclipse environment, an open source Java Integrated Development Environment. Eclipse provides a plugin-environment allowing easy extensions of AcmeStudio with new analyses and functionality, and customization of new architectural environments tailored to a particular organization.

#### 2.4.9.1 Supported Languages

AcmeStudio supports the following languages:

- Acme (see section 2.3.2)

#### 2.4.9.2 References

<http://acme.able.cs.cmu.edu/AcmeStudio/>

### 2.4.10 AlloyTool

Alloy's tool, the Alloy Analyzer, is a solver that takes the constraints of a model and finds structures that satisfy them. It can be used both to explore the model by generating sample structures, and to check properties of the model by generating counterexamples. Structures are displayed graphically, and their appearance can be customized for the domain at hand.

#### 2.4.10.1 Supported Languages

None

#### 2.4.10.2 References

### 2.4.11 AnyLogic

AnyLogic is the only simulation tool that supports all the most common simulation methodologies in place today: System Dynamics, Process-centric (AKA Discrete Event), and Agent Based modeling. The unique flexibility of the modeling language enables the user to capture the complexity and heterogeneity of business, economic and social systems to any desired level of detail. AnyLogic's graphical interface, tools, and library objects allow you to quickly model diverse areas such as manufacturing and logistics, business processes, human resources, consumer and patient behavior. The object-oriented model design paradigm supported by AnyLogic provides for modular, hierarchical, and incremental construction of large models. AnyLogic is a simulation software for the entire business lifecycle.

### 2.4.13 Asmeta

This site is dedicated to the Abstract State Machine Metamodel (AsmM, in brief), a metamodel for the Abstract State Machines (ASMs) formal method developed by following the guidelines of the Model-Driven Engineering (MDE).

#### 2.4.13.1 Supported Languages

None

#### 2.4.13.2 References

### 2.4.14 CHESS

Distributed dependable real-time embedded software systems, like Satellite on board software, are becoming increasingly complex due to the demand for extended functionalities or the reuse of legacy code and components. Model-Driven Engineering (MDE) approaches are good solutions to help build such complex systems. Addressing domain specific modeling (like component description and interaction, real-time constraints, ...) while keeping the flexibility and generality offered by languages like UML is a challenge in a context where software must be qualified according to safety and reliability standards.

#### 2.4.18.2 References

### 2.4.19 DIPLODOCUS

DIPLODOCUS stands for DesIgn sPace exLoration based on fOrmal Description teChniques, Uml and SystemC.

Basically, DIPLODOCUS targets the partitioning of Systems-on-Chip. Partitioning a system means finding the best candidate software and hardware architecture for executing a set of functions. This selection of architecture is thus made according to given criteria, e.g., cost, power consumption, performance, etc..

DIPLODOCUS supports the Y-Chart approach, i.e., the partitioning is done as follows:

Application modeling: functions of the system are first modeled. Functions might later be software or hardware implemented.

Architecture modeling: candidate hardware architectures are modeled in terms of parametrized nodes: execution nodes (CPU, hardware accelerators), communication nodes (buses, bridges) and storage nodes (memories).

Mapping modeling: functions are mapped onto a given candidate architecture, i.e. functions are allocated to either CPUs or hardware accelerators, and communication between functions are allocated to communication and storage nodes.

Moreover, DIPLODOCUS works at a high level of abstraction, and offers non-deterministic operators: this is thus very fast to model a first system, and evaluate different mappings for these functions. Moreover, all is graphical (UML). Last but not least, formal proofs and performance evaluation by simulation can be done at the push of a button, directly from UML diagrams.

#### 2.4.19.1 Supported Languages

None

#### 2.4.19.2 References

### 2.4.20 Dymola

Dymola is a physical modelling and simulation tool, used for model based design of complex engineering systems.

#### 2.4.22 ESMoL

Is a design language that includes the discrete-time subset of Simulink and Stateflow as sub-modeling languages, but it extends those with modeling constructs for componentization, platform modeling, and deployment modeling.

#### 2.4.22.1 Supported Languages

None

#### 2.4.22.2 References

#### 2.4.23 EclipseEDT

It is tool for EGL EGL, originally developed by IBM, is a programming technology designed to meet the challenges of modern, multi-platform application development by providing a common language and programming model across languages, frameworks, and runtime platforms. The language borrows concepts familiar to anyone using statically typed languages like Java, COBOL, C, etc. However, it borrows the concept of Stereotype from UML (Universal Modeling Language) that is not typically found in statically typed programming languages.

In a nutshell, EGL is a higher-level, universal application development language.

#### 2.4.23.1 Supported Languages

None

#### 2.4.23.2 References

#### 2.4.24 EclipseEMF

The EMF project is a modeling framework and code generation facility for building tools and other applications based on a structured data model. From a model specification described in XMI, EMF provides tools and runtime support to produce a set of Java classes for the model, along with a set of adapter classes that enable viewing and command-based editing of the model, and a basic editor.

#### 2.4.24.1 Supported Languages

None

#### 2.4.24.2 References

#### 2.4.25 EclipseERD

a database design tool that provides graphical representation of database tables, their columns and inter-relationships.

### 2.4.25.1 Supported Languages

### 2.4.38 NuSMV

NuSMV is a symbolic model checker developed as a joint project between: -The Embedded Systems Unit in the Center for Information Technology at FBK-IRST -The Model Checking group at Carnegie Mellon University, the Mechanized Reasoning Group at University of Genova -The Mechanized Reasoning Group at University of Trento. NuSMV is a reimplementation and extension of SMV, the first model checker based on BDDs. NuSMV has been designed to be an open architecture for model checking, which can be reliably used for the verification of industrial designs, as a core for custom verification tools, as a testbed for formal verification techniques, and applied to other research areas. NuSMV2, combines BDD-based model checking component that exploits the CUDD library developed by Fabio Somenzi at Colorado University and SAT-based model checking component that includes an RBC-based Bounded Model Checker, which can be connected to the Minisat SAT Solver and/or to the ZChaff SAT Solver. The University of Genova has contributed SIM, a state-of-the-art SAT solver used until version 2.5.0, and the RBC package use in the Bounded Model Checking algorithms.

None

##### 2.4.42.2 References

#### 2.4.43 OpenModelica

OPENMODELICA is an open-source Modelica-based modeling and simulation environment intended for industrial and academic usage. Its long-term development is supported by a non-profit organization i.e. the Open Source Modelica Consortium (OSMC).

##### 2.4.43.1 Supported Languages

None

##### 2.4.43.2 References

#### 2.4.44 Overture

The Overture tool ([www.overturetool.org](http://www.overturetool.org)) represents the opening of these tools. This tool is build on top of the Eclipse platform and it support all the VDM dialects: VDM-SL, VDM++ and VDM Real-Time (VDM-RT). Many different features are included but the emphasis is on validation of VDM models by interpretation of executable subsets. This also includes support for DE notation VDM-RT used inside the Crescendo tool. Users who are only interested in Discrete Event (DE) modelling using one or more of the VDM dialects should use this Overture tool.

##### 2.4.44.1 Supported Languages

None

### 2.4.44.2 References

#### 2.4.45 PHAVer

Polyhedral Hybrid Automaton Verifier: PHAVer is a tool for verifying safety properties of hybrid systems. It stands out from other tools with the following features: -exact and robust arithmetic with unlimited precision, -on-the-fly over-approximation of piecewise affine dynamics -improved algorithms and termination heuristics -support for compositional and assume-guarantee reasoning.

##### 2.4.45.1 Supported Languages

None

### 2.4.45.2 References

#### 2.4.46 PRISM

PRISM is a probabilistic model checker, a tool for formal modelling and analysis of systems that exhibit random or probabilistic behaviour. It has been used to analyse systems from many different application domains, including communication and multimedia protocols, randomised distributed algorithms, security protocols, biological systems and many others.

##### 2.4.46.1 Supported Languages

None

### 2.4.46.2 References

#### 2.4.47 Palladio

Palladio is a software architecture simulation approach which analyses your software at the model level for performance bottlenecks, scalability issues, reliability threats, and allows for a subsequent optimisation. Palladio requires neither buying expensive executions environments (servers, networks, or storage) nor fully implementing a software product. Construction rules are automatically checked by Palladio and thus allow optimal software architectures without costly trial-and-error-cycles. Like in other engineering disciplines, Palladio enables software engineers to construct software straight and in the right way.

#### **2.4.50 Ptolemy**

The Ptolemy project studies modeling, simulation, and design of concurrent, real-time, embedded systems. The focus is on assembly of concurrent components. The key underlying principle in the project is the use of well-defined models of computation that govern the interaction between components. A major problem area being addressed is the use of heterogeneous mixtures of models of computation. A software system called Ptolemy II is being constructed in Java. The work is conducted in the Center for Hybrid and Embedded Software Systems (CHESS) in the Department of Electrical Engineering and Computer Sciences of the University of California at Berkeley. The project is directed by Prof. Edward Lee. The project is named after Claudius Ptolemaeus, the second century Greek astronomer, mathematician, and geographer.

#### **2.4.50.1 Supported Languages**

None

#### **2.4.50.2 References**

#### **2.4.51 ROS**

ROS (Robot Operating System) provides libraries and tools to help software developers create robot applications. It provides hardware abstraction, device drivers, libraries, visualizers, message-passing, package management, and more. ROS is licensed under an open source, BSD license.

#### 2.4.54 Remes

Remes is a tool for formal modeling of embedded resources such as storage, energy, communication, and computation. The model is a state-machine based behavioral language with support for hierarchical modeling, resource annotations, continuous time, and notions of explicit entry and exit points that make it suitable for component-based modeling of embedded systems. The analysis of RE ME S-based systems is centered around a weighted sum in which the variables represent the amounts of consumed resources.

#### 2.4.55 SCADE

SCADE Suite is a product line of the ANSYS Embedded software family of products and solutions that empowers users with a Model-Based Development Environment for critical embedded software. With native integration of the formally-defined Scade language, SCADE Suite is the integrated design environment for critical applications spanning requirements management, model-based design, simulation, verification, qualifiable/certified code generation, and interoperability with other development tools and platforms.

#### 2.4.56 SOFA-HI

SOFA HI is an extension of the SOFA 2 component model, targeted at high-integrity real-time embedded systems.

The key additions and differences of SOFA HI comparing to SOFA 2 include various restrictions of the component model in order to make it more predictable and lightweight. For instance, SOFA HI restricts dynamic architecture reconfigurations to dynamic component updates at runtime only, while SOFA 2 supports more types of dynamic architecture reconfigurations). In addition, while SOFA 2 does not consider any restricted computational model, SOFA HI considers the Ravenscar Computational Model for local deployments, with an extension for distributed deployments.

#### 2.4.57 SPL

Stochastic Performance Logic Compared to functional unit testing, performance unit testing is more difficult, partially because correctness criteria are more difficult to express for performance than for functionality. Using the Stochastic Performance Logic (SPL), we aim to express assertions on code performance in relative, hardware-independent terms. Using the performance unit testing tools, these assertions can be automatically validated. Besides performance

unit testing, we experiment with using the performance unit tests to generate data for software documentation extended with performance information. Other research includes incorporating performance awareness into adaptive applications.

#### 2.4.62 StrataGEM (Strategy Generic Extensible Modelchecker)

Strategy Generic Extensible Modelchecker (StrataGEM), a tool aimed at the analysis of Petri nets and other models of concurrency by means of symbolic model-checking techniques. StrataGEM marries the well know concepts of Term Rewriting (TR) to the efficiency of Decision Diagrams (DDs). TR systems are a great way to describe the semantics of a system, being readable and compact, but their direct implementation tends to be rather slow on large sets of terms. On the other hand, DDs have demonstrated their efficiency for model-checking, but translating a system semantics into efficient DDs operations is an expert's matter. StrataGEM describes the semantics of a system in terms of strategies over a TR system, and automatically translates these rules into operations on DD to handle the model-checking. The ultimate goal of StrataGEM is to become a verification framework for the different variants of Petri nets by separating the semantics of the model from the computation that performs model-checking.

#### 2.4.65 TINA\_SELt (Time petri Net Analyzer - State/Event LTL model checker)

Tina (TIme Petri Net Analyser)<sup>1</sup> is a software environment for the editing and analysis of Petri net and Time Petri net (Merlin and Farber 1976). In addition to the usual editing and analysis facilities of such environments (computation of marking reachability sets, coverability trees, semi-flows), Tina offers various abstract state space constructions that preserve specific classes of properties of the concrete state spaces of the nets. These classes of properties may be general properties (reachability properties, deadlock freeness, liveness), specific properties relying on the linear structure of the concrete space state (linear time temporal logic properties, test

equivalence), or properties relying on its branching structure (branching time temporal logic properties, bisimulation).

#### **2.4.70 UMLMAST**

UML-MAST is a methodology and a set of tools for modeling and analyzing object oriented real-time systems expressed in UML. It is based on the concept of the "Mast RT View" of the system, which describes in a qualitative and quantitative way the timing behavior, the real-time performance constraints and relevant implementation parameters from the real-time perspective.

The use of a real-time view allows the designer building the real-time system model gradually according to the evolution of the development process, feeding the analysis tools, and bringing back into the model the relevant timing responses. Therefore UML-MAST follows the model processing paradigm.

#### 2.4.72 UppaalSMC (Statistical Model Checking Extension for the UPPAAL Toolset.)

Statistical Model Checking (SMC) refers to a series of techniques that monitor several runs of the system with respect to some property, and then use results from the statistics to get an overall estimate of the correctness of the design. The approach has been applied to problems that are far beyond the scope of existing model checkers. In fact, SMC gets widely accepted in various research areas such as systems biology or software engineering, in particular for industrial applications. There are several reasons for this success. First, it is very simple to implement, understand and use (especially by industry, software engineers, and generally all people that are not pure researchers but customers for our results and tools). Second, it requires little or no extra modeling or specification effort, but simply an operational model of the system that can be simulated and checked against properties. Third, the use of Statistics allows to approximate undecidable problems. Finally, it is possible to easily distribute SMC.

### 3 Glossary of Terms for Cyber Physical Systems

For the glossary we were able to identify a list of terms presented in the two following Tables 3.1 and 3.2 that are important for MPM4CPS. As many terms are related or even included in the ontology already, we plan to integrate them into the ontology model in the long run rather than maintaining a separate source/representation, and generate this part of the document automatically.

term	subterm	class	area of origin
			dynamical systems theory
	Heterogeneous systems	types of systems	
	Multi-modal systems		
	Multi-controller systems		
	Logic-based switching systems		
	Discrete-event systems		
	Transition systems		
	Variable structure systems		
	Discontinuous/switched/non-smooth systems		
	Complementarity systems		
	Reset systems		
	Jump systems		
	Piecewise-affine systems		
	Mixed logical dynamical systems		
	Impulsive systems		
	Cyber-physical systems of systems		
	Cyber-physical networked embedded systems	modelling	
	Large-scale smart systems		
	Hybrid automata		
	Bond graphs		
	Petri nets		
	Complementarity models		
	Event-flow formulae		
	Bisimulations		
	Symbolic dynamics		
	Sliding motions	analysis	
	abstraction of energy in the system:		
	passivity		
	dissipativity		
	Stability		
	State space	verification properties	Verification
	State partition		
	Safety properties		
	Liveness properties		
	Deadness properties		
	Reachability	verification techniques	
	Correctness/consistency		
	Model checking		
	Theorem proving (deductive approach)		
	Falsification		
	Constraint satisfaction	Validation	
	Boolean satisfiability		
	Satisfiability modulo theories		
	Symbolic methods		
	Dynamically-aware verification		
	automated reasoning	control properties	Control
	Testing		
	Debugging		
	Controllability		
	Observability		
	Robustness	control strategies	
	Practical stability		
	Operation modes		
	Adaptive control		
	Decentralized/hierarchical control		
	Optimal control	control concepts	
	Feedback/feedforward		
	Closed loops		
	Environment		
	Sensors/actuators		
	Set points/control goals		
	Disturbances/perturbations		
	Parameter identification		
	Signal processing		
	Contingency/risk analysis		

**Table 3.1:** Terms for the glossary (1/2)

term	subterm	class	area of origin
		dynamical behaviours	Behavior
	Chattering		
	Zeno behaviour		
	Sliding behaviour		
	Discontinuous/sliding bifurcations (border collision, corner bifurcations)		
	Oscillations/limit cycles		
	Strange/complex behaviours (chaos)		
	Robustness		
	Resilience		
	Stability (different types)		
	Emergent behaviour		
	Phase transitions		
	Collective/group behaviour		
	Self-organization		
	Adaptive networks		
	Collaboration:		
	Cooperation		
	Competition		
	Swarming		
	Flocking		
	Consensus		
	Synchronization		
	Pinning control		
	Coupling		
	Agent-based systems		
	Swarm intelligence		
	Graph theory		
	Statistical physics		
	systems biology		
	financial markets		
	social systems		
	etc.		
	Observability/Visibility (black/grey/white box)		
	Syntax vs. Semantics		
	Visual vs. textual (or mixture) syntax		
	System vs. Environment (vs. controller)		
	Cognitive gap to the domain		
	Suitability		
	Intent (general): ilities		
	Intent (of building models):		
	Intent -> Objectives		
	Validation vs. verification		
	Tolerance		
	Generality (general / domain-specific)		
	Domain		
	Properties that can be modeled (~ requirements)		
	requirements vs. design languages		
	Abstraction levels		
	Abstraction: available info vs. questions		
	Heterogeneity of ...		
	Megamodel		
	Autonomy		
	Emerging Properties		
	Unification		
	Non-function usability)		
	User in a CPS		
	Consistency		
	Composability		
	Semantic adaptation		
	System of Systems		
	Inductive		
	planning process of modeling		
	Variability		
	Sensitivity		
	Architecture		
	Deployment		
	X-in-the-loop		
	Ontological vs. Linguistic (and consistency between them)		
	Consistency (wrt. set of properties)		
	System of Systems		
	Smart objects		
	Planning at system level		
	governance		
	technical control		
	choreography		
	orchestration		
		Other behaviors

## 4 Summary and Future Work

In this report on the State-of-the-art on Current Formalisms used in Cyber-Physical Systems Development of Working Group1 (WG1) on Foundations of the ICT COST Action IC1404 Multi-Paradigm Modelling for Cyber-Physical Systems (MPM4CPS), we first presented a catalog of languages, formalisms, and tools in chapter 2. Then a glossary of terms for Cyber Physical Systems has been presented in chapter 3.

Both the catalog and glossary still need to be improved as future work. For the catalog, the documentation of each entry and the completeness of the catalog still have to be improved. In addition, the three main categories of languages, formalisms and tools of the catalog better populated, reviewed, and updated to reflect the finer classification provided by the ontology from which they are generated. Finally, the presented glossary of terms for Cyber-Physical Systems is currently still incomplete and has to be reworked to cover all relevant terms and be better linked to the ontologies.
