

**STRUCTURAL DYNAMICS AND MEMBRANE
INTERACTIONS OF THE CHLORIDE
INTRACELLULAR CHANNEL PROTEIN, CLIC1**

Christos Nathaniel

**A thesis submitted to the Faculty of Science, University of the Witwatersrand, in
fulfilment of the requirements for the degree of Doctor of Philosophy.**

Johannesburg, 2007

DECLARATION

I declare that this thesis is my own, unaided work. It is being submitted for the degree of Doctor of Philosophy in the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination in any other University.

Christos Nathaniel

day of 2007.

**This thesis is dedicated to my loving family: Omiros, Anna and Andreas
Nathaniel**

ABSTRACT

The Chloride Intracellular Channel (CLIC) proteins are a family of amphitropic proteins that can convert from soluble to integral membrane forms. CLIC1 is a member of this family that functions as a chloride channel in the plasma and nuclear membranes of cells. Although high-resolution structural data exists for the soluble form of monomeric CLIC1, not much is known about the integral membrane forms' structure. The exact mechanism and signals involved in the conversion of the soluble form to membrane-inserted form are also not clear.

Studies were undertaken in the absence and presence of membrane models. Analysis of the structure and stability of CLIC1 in the absence of membrane investigated the effect of possible signals or triggers that may play a crucial role in the conversion of the soluble form to integral membrane form. Exposing CLIC1 to oxidizing conditions results in the formation of a dimeric form. The CLIC1 dimer was found to be less stable than the monomeric form based on unfolding kinetic studies. The stability of the dimer was also less influenced by salt concentration, compared with the monomer. The effect of pH on the structure of CLIC1 is of physiological relevance since the movement of soluble CLIC1 in the cytoplasm or nucleoplasm toward the membrane will involve the protein being exposed to a lower pH micro-environment. Hydrogen exchange mass spectrometry was used to study the structural dynamics of CLIC1 at pH 7.0 and pH 5.5. At neutral pH, domain II is more stable than the more flexible thioredoxin domain I. The thioredoxin-fold therefore is more likely to unfold and rearrange to insert into membranes. Because of the high stability of domain II this region is probably where the folding nucleus of the protein is. At pH 5.5 it was found that the $\alpha 1$, $\alpha 3$ and $\alpha 6$ helices, which are spatially adjacent to one another across the domain interface, were destabilized. This destabilization may be the trigger for CLIC1 to unfold and rearrange into a membrane insertion-competent form. The role of the primary sequence and unique three-dimensional structure of CLIC1 in membrane insertion was investigated in a bioinformatics-based study that looked at conserved residue features such as hydrophathy and charge. Hidden helical propensities and N-capping motifs in the $\alpha 1$ - $\beta 2$ region were found, which may have important implications for locating putative transmembrane regions.

Analysis of the structure and thermodynamics of CLIC1 interacting with membranes investigated changes in secondary structure, tertiary structure, hydrodynamic volume and thermodynamics when CLIC1 is exposed to membrane-mimicking models. The effect of a variety of conditions such as pH and redox, cysteine-modifying agents (NEM), ligands (GSH), and inhibitors (IAA) on CLIC1 membrane interaction were studied. It was found that CLIC1 interacted with membranes more favourably at lower pH and that NEM completely inhibited CLIC1 interaction with micelles.

ACKNOWLEDGEMENTS

I would like to acknowledge and thank:

My supervisor, Professor Heini Dirr, for all his guidance, support and the privilege of working in his lab.

Dr. Yasien Sayed for all his assistance with isothermal titration calorimetry.

Mrs. Sylvia McIntyre for all her assistance with the protein purification and helpful discussions.

Mr. Stoyan Stoychev for informative discussions regarding CLIC1.

All the members of the Protein Structure-Function Unit for their encouragement, support and interesting discussions.

Dr. Virgil Woods at the University of California San Diego, USA for hosting and training me on the use of hydrogen exchange mass spectrometry.

Ms. Melissa Brock and Mrs. Krissi Hewitt for assistance with the hydrogen exchange mass spectrometry sample preparation, data reduction and analysis.

The National Research Foundation of South Africa for their financial support.

The University of the Witwatersrand for their financial assistance with the postgraduate merit award.

DECLARATION	ii
DEDICATION	iii
ABSTRACT	iv
ACKNOWLEDGEMENTS	vi
ABBREVIATIONS	x
LIST OF FIGURES	xii
LIST OF TABLES	xvii
CHAPTER 1: INTRODUCTION	
1.1 Biological membranes	
1.1.1 Structure and properties	1
1.1.2 Channels and pores	5
1.2 Amphitropic proteins	
1.2.1 Overview	6
1.2.2 Pore-forming toxins	7
1.2.3 Other dual-form (amphitropic) proteins	13
1.2.4 Membrane insertion	15
1.3 GST family and the thioredoxin fold: New roles in membrane interaction	17
1.4 Chloride Intracellular Channel protein(CLIC) family	19
1.5 CLIC1 overview	
1.5.1 Distribution and functional role	23
1.5.2 Structure of soluble CLIC1	25
1.5.3 Conversion of soluble CLIC1 to integral-membrane form	29
1.6 Objectives	36
CHAPTER 2: EXPERIMENTAL PROCEDURES	
2.1 Materials	37
2.2 Methods	
2.2.1 Plasmid verification	37
2.2.2 Over-expression and purification	38

2.2.3	SDS-PAGE	39
2.2.4	Concentration determination	40
2.2.5	SEC-HPLC	40
2.2.6	Preparation and purification of dimeric CLIC1	41
2.2.7	pH adjustment	41
2.2.8	Liposome and micelle preparation	42
2.2.9	Fluorescence studies	43
2.2.10	Far-UV circular dichroism spectroscopy studies	44
2.2.11	Unfolding and refolding kinetics by manual mixing	45
2.2.12	Dynamic light scattering	45
2.2.13	Isothermal titration calorimetry	46
2.2.14	Deuterium exchange mass spectrometry	48
CHAPTER 3: RESULTS		
3.1	Plasmid verification	55
3.2	Protein over-expression and purification	55
3.3	REDOX effects on CLIC1	
3.3.1	REDOX effects on CLIC1 structure	61
3.3.2	REDOX effects on CLIC1 stability	66
3.4	Effect of pH on CLIC1	
3.4.1	Effect of pH on CLIC1 structure	73
3.4.2	Effect of pH on CLIC1 structural dynamics using hydrogen-deuterium exchange mass spectrometry	
3.4.2.1	Optimisation of CLIC1 proteolytic fragmentation	76
3.4.2.2	Deuterium on-exchange of CLIC1 at pH 7.0	76
3.4.2.3	HXMS of CLIC1 at pH 5.5	87
3.5	Thermodynamics of ligand binding	95
3.6	CLIC1 interaction with membrane model systems	
3.6.1	Effects of membrane-mimetic trifluoroethanol	96
3.6.2	Cholesterol-containing liposomes	99
3.6.2.1	Structural effects	99
3.6.2.2	Isothermal titration calorimetry	101
3.6.3	Asolectin liposomes	
3.6.3.1	Structural effects	104

3.6.3.2 Thermodynamic effects	109
3.6.4 Detergent micelles	
3.6.4.1 Structural effects	109
3.6.4.2 Thermodynamic effects	113
3.7 Bioinformatics	
3.7.1 Transmembrane region prediction and hydropathy plots	127
3.7.2 Sequence alignments showing charge conservation	130
3.7.3 Helix propensities using AGADIR	130
3.7.4 Phosphorylation sites and signalling motifs	135
3.7.5 Surface area determination	135
CHAPTER 4: DISCUSSION	
4.1 Structure and stability of CLIC1 in absence of membrane	
4.1.1 REDOX effect on CLIC1	138
4.1.2 pH effects on CLIC1	140
4.1.3 CLIC1 sequence and structure analysis	149
4.2 Interaction of CLIC1 with membrane models	
4.2.1 TFE	153
4.2.2 Liposomes	154
4.2.3 Sarkosyl micelles	158
4.2.4 Model for membrane insertion and channel orientation	166
CHAPTER 5: REFERENCES	169
