

**AN OSTEOLOGICAL COMPARISON BETWEEN BONTEBOK,
Damaliscus pygargus pygargus, AND BLESBOK, *Damaliscus pygargus
phillipsi* AND ITS BEARING ON THE EVOLUTION OF BONTEBOK.**

By

Nonhlanhla Vilakazi

A dissertation submitted to the Faculty of Science, University of the Witwatersrand,
Johannesburg, in fulfilment of the requirements for the degree of Master of Science.

Johannesburg, 2008.

DECLARATION

I declare that this dissertation is my own, unaided work. It is submitted for the Degree of Master of Science at the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination in any other University.

Date: _____

ABSTRACT

The alcelaphine species *Damaliscus pygargus* has two subspecies: the bontebok *Damaliscus pygargus pygargus* and the blesbok *Damaliscus pygargus phillipsi*. On analogy with black wildebeest evolution, it is thought that the two subspecies became biogeographically distinct during the Last Glacial, when lowered sea levels exposed additional plains habitat on the continental platform. This would have caused reproductive isolation between interior and coastal populations with the Cape Fold Mountains acting as biogeographic barrier. The aim of this study was to test the possibility of the osteological discrimination between the two subspecies by using reference specimens from the National Museum, Bloemfontein, and Iziko South African Museum, Cape Town. It was hypothesized that bone morphology and measurements would serve to differentiate between the subspecies, which are adapted to different environments, and thus experience different stresses. However, results showed no significant differences between the two subspecies osteologically.

ACKNOWLEDGEMENTS

I would like to thank my supervisors, Dr James Brink and Dr Lucinda Backwell, for all their guidance, support and contributions to my study.

Thank you very much James Brink for teaching me osteological comparison techniques together with faunal identification, it was very worthy for this particular study, I will forever be grateful for that.

I also thank Lucinda extensively for reading my write-up drafts and helping me out with corrections. I also thank her for awarding me an NRF bursary since she is a grant holder.

The staff at the Florisbad Quaternary Research Station for all their help with the collections.

I acknowledge the many valuable corrections and suggestions made by one of my reviewers that helped improve this work.

Thanks to Sbusiso Mgaga for the support you've shown me throughout my Master of Science study.

Thank you to PAST for awarding me a bursary without which I would not have been able to study and do what I love.

Finally, thank you to my mom, Rebecca, my sister, Nonkululeko, my grandparents, Crown and Adeline, and my uncles, Teboho and Mpho, for moral support. Thank you so much guys for allowing me to follow my passion and study palaeontology. I would also like to thank you for showing interest in what I'm studying.

This is dedicated to my mom and sister:
Rebecca Dube and Nonkululeko Vilakazi

Figure 193: Univariate analysis of the depth of the lateral half of the talus showing outliers.....	164
Figure 194: Univariate plot of the breadth of the distal end of the talus.....	165
Figure 195: Photo showing the plantar view of the calcaneus of bontebok and blesbok.....	166
Figure 196: Photo showing the dorsal view of the calcaneus of bontebok and blesbok.....	166
Figure 197: Bivariate plot of the greatest breadth over the <i>sustenaculum</i> versus the greatest length of the calcaneus showing regression for both groups.....	167
Figure 198: Standard error cell plot of the greatest length of the calcaneus (error bars: ± 1 STD deviation).....	168
Figure 199: Standard error cell plot of the greatest breadth of the calcaneus (error bars: ± 1 STD deviation).....	169
Figure 200: Univariate plot of the greatest breadth of the calcaneus with outliers.....	170
Figure 201: Univariate plot of the greatest breadth split by sex and subspecies.....	171
Figure 202: Univariate plot of the greatest length of the calcaneus.....	172
Figure 203: Univariate analysis of the greatest length of the calcaneus split by subspecies and sex of the specimens.....	173
Figure 204: Photo showing the dorsal view of the first phalanx of bontebok and blesbok.....	174
Figure 205: Bivariate analysis showing the greatest length of the peripheral (abaxial) half versus the smallest breadth of the diaphysis of the first phalanx showing the regression of both groups.....	175
Figure 206: Bivariate analysis of the proximal breadth versus the distal breadth of the first phalanx showing the regression of both groups.....	176
