

WORKSHOP ON STOCK ASSESSMENT OF YELLOWFIN TUNA IN
THE INDIAN OCEAN

(Colombo, Sri Lanka 7-12 October, 1991)

YELLOWFIN LENGTH-WEIGHT RELATIONSHIPS FROM
WESTERN INDIAN OCEAN PURSE SEINE FISHERIES

by J.P. HALLIER*

RESUME : Les derniers résultats sur les relations longueurs-poids pour l'albacore (*Thunnus albacares*) avaient été présentés en 1990 lors du comité d'expert qui s'était tenu à Bangkok en juillet 1990. L'échantillonnage était alors insuffisant pour les petits albacores (poissons inférieurs à 22 cm de LD1). La série de données a été complétée et les analyses ont conduit à plusieurs relations qui sont données ici avec les tableaux correspondants longueurs-poids.

SUMMARY: The last informations on yellowfin length-weight relationships (*Thunnus albacares*) have been issued during the Expert Committee which took place in Bangkok in July 1990. At that time, sampling data on small yellowfin (fish less than 22cm in FLD) were insufficient. Since then, data have been updated and new relationships are given thereafter with the corresponding length-weight tables.

1. DATA AVAILABLE

To data previously collected at the Victoria cannery we added data collected in Port during transhipment operations and a few more made at the cannery. They all were collected on small yellowfin in order to complete the series already in hands.

Altogether the samples reach now 2393 yellowfins for Fork Length (FL) and First Dorsal Length (FDL); 2242 for FL and Weight (WT) and 2228 for FDL and WT.

2. STATISTICAL METHODS

Relationships are calculated using linear regression (least square method), and different models are tested (exponential, logarithmic, power), after having converted data. In order to detect uncertain plots, an analysis of standardized residual was made. If data fit properly with the model, standardized residual values must be approximately between -2 and +2. Every plot beyond these values can be suspected and has to be checked and then be deleted from the sample. Residuals are reported in accordance with independant variable and if they show a particular tendency structure, that means there is a link between residuals and independant variable, therefore, regression equation must be rectified (Sherrer, 1984). Regression lines are compared by using a covariance analysis.

3. RESULTS AND DISCUSSIONS

3.1 Analysis of data collected

Among the different relationships calculated, the best correlation was obtained with an equation of the type $y = ax+b$ after a log to log transformation of the variables. However, as previously noted (de MONTAUDOUIN et al, 1991) relationships are more properly described when samples are separated between small size fish on one side and medium size and large size fish on the other side.

3.2 Relationships FL - FDL

The general relationship, described by figure 1, responds to the equation:

$$y = 1.1477 x + 0.3195 \quad (n = 2393)$$

$y = \text{Log FL in cm}$

$x = \text{Log FDL in cm}$

When data are separated in the two data groups easily recognizable from figure 1, we obtain the two following equations:

$$(1) y_1 = 0.9899 x_1 + 0.5113 \quad (n = 679)$$
$$y_1 = \text{Log FL in cm}$$
$$x_1 = \text{Log FDL for } FDL \leq 17.5 \text{ cm}$$

Figure 2 shows these results.

$$(2) y_2 = 1.1647 x_2 + 0.2942 \quad (n = 1714)$$
$$y_2 = \text{Log FL in cm}$$
$$x_2 = \text{Log FDL for } FDL \geq 17.5 \text{ cm}$$

These results are illustrated in figure 3

FDL of 17.5 cm is the crossing point of the two regression lines.

Fonds Documentaire ORSTOM

Cote: B* 8328 Ex: 1

3.3. Relationship FL-WT

A general relationship taking into account all available data ($n = 2242$) is shown in figure 4 and the equation given below :

$$\begin{aligned}y &= 2.9773 x - 4.6607 \\y &= \text{Log WT in kg.} \\x &= \text{Log FL in cm.}\end{aligned}$$

These data have been divided into two groups on both sides of 64 cm FL, the crossing point of the two regression lines:

$$(1) y_1 = 2.7537 x_1 - 4.2747 \quad (n = 716)$$

$y_1 = \text{Log WT in kg.}$
 $x_1 = \text{Log FL for } \text{FL} \leq 64 \text{ cm}$
Figure 5

$$(2) y_2 = 3.0450 x_2 - 4.8001$$

$y_2 = \text{Log WT in kg.}$
 $x_2 = \text{Log FL for } \text{FL} \geq 64 \text{ cm}$
Figure 6

3.4. Relationship FDL-WT

A general relationship with all data available ($n = 2228$) is shown in figure 7 and the equation is as follows :

$$\begin{aligned}y &= 3.4157 x - 3.7086 \\y &= \text{Log WT in kg.} \\x &= \text{Log FDL in cm.}\end{aligned}$$

As for other relationships, two data groups have been identified on both sides of 19.0cm FDL :

$$(1) y_1 = 2.7641 x_1 - 2.9131 \quad (n = 692)$$

$y_1 = \text{Log WT in kg.}$
 $x_1 = \text{Log FDL for } \text{FDL} \leq 19.0 \text{ cm}$
Figure 8.

$$(2) y_2 = 3.5837 x_2 - 3.9612 \quad (n = 1536)$$

$y_2 = \text{Log WT in kg.}$
 $x_2 = \text{Log FDL for } \text{FDL} \geq 19.0 \text{ cm}$
Figure 9.

4. CONCLUSIONS

All relationships used for Western Indian Ocean purse seine fisheries are listed in tables 1.

Tables 2, 3 and 4 are giving the yellowfin relationships respectively for FDL-FL, FDL-WT and FL-WT.

REFERENCES

MONTAUDOUIN (de) X., J.P. HALLIER and S. HASSANI, 1991. Length-weight relationships for yellowfin (*Thunnus albacares*) and skipjack (*Katsuwonus pelamis*) from Western Indian Ocean. ITPP Collective Volume of Working Documents, Vol 4, TWS/90/48 : pp 47-65.

Table 1 : YELLOWFIN LENGTH-WEIGHT RELATIONSHIPS

$\text{FDL} \leq 17.5 \text{ cm}$	$\text{Log FL} = 0.9899 \text{ Log FDL} + 0.5113$
$\text{FDL} \geq 17.5 \text{ cm}$	$\text{Log FL} = 1.1647 \text{ Log FDL} + 0.2942$
$\text{FDL} \leq 19.0 \text{ cm}$	$\text{Log WT} = 2.7641 \text{ Log FDL} - 2.9131$
$\text{FDL} \geq 19.0 \text{ cm}$	$\text{Log WT} = 3.5837 \text{ Log FDL} - 3.9612$
$\text{FDL} \leq 64.0 \text{ cm}$	$\text{Log WT} = 2.7537 \text{ Log FL} - 4.2747$
$\text{FDL} \geq 64.0 \text{ cm}$	$\text{Log WT} = 3.0450 \text{ Log FL} - 4.8001$

b) in exponential equation

$\text{FDL} \leq 17.5 \text{ cm}$	$\text{FL} = 3.2456 \text{ FDL}^{0.9899}$
$\text{FDL} \geq 17.5 \text{ cm}$	$\text{FL} = 1.9688 \text{ FDL}^{1.1647}$
$\text{FDL} \leq 19.0 \text{ cm}$	$\text{WT} = 1.2215 \times 10^{-3} \text{ FDL}^{2.7641}$
$\text{FDL} \geq 19.0 \text{ cm}$	$\text{WT} = 1.0935 \times 10^{-4} \text{ FDL}^{3.5837}$
$\text{FDL} \leq 64.0 \text{ cm}$	$\text{WT} = 5.3125 \times 10^{-5} \text{ FL}^{2.7537}$
$\text{FDL} \geq 64.0 \text{ cm}$	$\text{WT} = 1.5845 \times 10^{-5} \text{ FL}^{3.0450}$
