Crystal structure of 12-(2-hydroxybenzoyl)benzo[f]pyrido[1,2-a]indole-6,11-dione, C₂₃H₁₃NO₄

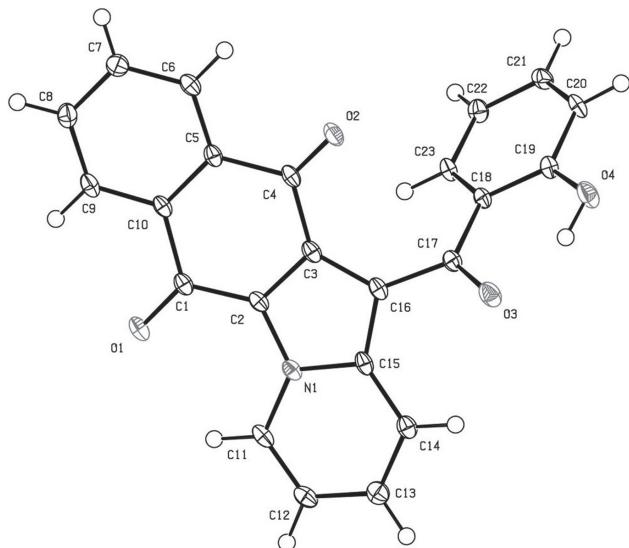

Table 1: Data collection and handling.

Crystal:	Orange lath
Size:	0.31 × 0.17 × 0.03 mm
Wavelength:	Mo K α radiation (0.71073 Å)
μ :	0.11 mm $^{-1}$
Diffractometer, scan mode:	Bruker Kappa APEX-II, φ and ω
θ_{max} , completeness:	30.5°, >99%
$N(hkl)$ _{measured} , $N(hkl)$ _{unique} , R_{int} :	14398, 4810, 0.049
Criterion for I_{obs} , $N(hkl)$ _{gt} :	$I_{\text{obs}} > 2 \sigma(I_{\text{obs}})$, 3317
$N(\text{param})$ _{refined} :	256
Programs:	Bruker [1], SHELX [2, 3]

Source of material

To a solution of 2,3-dichloronaphthalene-1,4-dione (0.5 g, 2.2 mmol) in anhydrous pyridine (50 mL), (*E*)-1-(2-hydroxyphenyl)-3-phenylprop-2-en-1-one (0.49 g, 2.2 mmol) was added and heated to 85 °C. After 24 h, the mixture was cooled to room temperature and diluted with water (250 mL) and the resulting precipitate was collected *via* filtration, dried and purified by preparative TLC (silica gel thickness = 1000 microns, 20 cm × 20 cm) using chloroform and methanol as mobile phase (20:1 v/v) to yield an orange solid. The solid was crystallized with a few drops of methanol in chloroform to furnish orange colored crystals. The melting point was determined as 537–538 K using a XT-4 melting point instrument (Beijing Taike Instrument Co., Ltd, China). NMR spectra were performed on a DRX-500 Bruker NMR spectrometer (Bruker, Germany). **¹H-NMR** (500 MHz, CDCl₃) δ : [ppm] 12.22 (1H, s), 9.82 (1H, d, J = 7.0 Hz), 8.30 (1H, d, J = 75 Hz), 8.13 (1H, d, J = 7.6 Hz), 7.79~7.76 (2H, m), 7.70 (1H, t, J = 7.5 Hz), 7.55~7.50 (2H, m), 7.39 (1H, t, J = 7.5 Hz), 7.21 (1H, t, J = 6.7 Hz), 7.13 (1H, d, J = 8.3 Hz), 6.79 (1H, t, J = 7.6 Hz); **¹³C-NMR** (125 MHz, CDCl₃) δ : [ppm] 196.3, 180.9, 174.9, 162.8, 138.1, 136.7, 134.4, 133.9, 133.5, 133.2, 133.2, 128.2, 128.0, 127.4, 127.2, 126.4, 121.4, 120.8, 119.9, 118.8, 118.4, 117.6, 112.5. **IR** (ν_{max} , cm $^{-1}$): 2953, 2920, 2851; 1662, 1638, 1619; 1578, 1496, 1466, 1430; 1388, 1366, 1312, 1289, 1254, 1220, 1189, 1146, 1108, 1062, 877, 844, 747. **ESI-MS**: 368.0 [M + 1] $^{+}$; **ACPI-MS**: 368.0 [M + 1] $^{+}$, 366.8 [M – 1] $^{-}$.

Experimental details

H atoms were positioned geometrically with d (O–H) = 0.90 Å, d(C–H) = 0.95 Å (aromatic CH), and treated

as riding atoms. For all H atoms, isotropic displacement parameters were calculated as $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ and $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$.

Comment

The naphthofuranquinone core which is integral part of various anticancer natural products such as Balsaminone A [4] was achieved via simple base-catalyzed condensation reaction between 1,4-naphthoquinone and the corresponding phenol. Intermolecular O-alkylation followed by intramolecular C–C-bond formation are believed to be essential steps for the formation of naphthofuranquinone scaffold [5]. In an attempt to synthesize the naphthofuranquinones

derived from coupling of 1,4-naphthoquinone with *trans*-2'-hydroxychalcone resulted an unusual compound instead of naphthofuranquinone. Crystal structure analysis confirmed the formation of benzpyrido[1,2-*a*]indoledione as the product. This intermolecular cyclization mechanism was very interesting and formation of such product with 2'-hydroxy acetophenone is reported. In order to form such fused compounds, it appears that the building block *o*-hydroxy acetophenone was generated *in situ* from *trans*-2'-hydroxychalcone via some kind of *retro*-aldol-like decomposition [6]. A different method of synthesizing the compound directly using substituted acetophenone react with 1,4-naphthoquinone confirmed this mechanism [7]. The title crystal structure is only built up by C₂₃H₁₃NO₄ molecules, in which all geometric parameters are normal. There is an intramolecular hydrogen bond: O4–H4O···O3 ($d(\text{O}4-\text{H}4\text{O}\cdots\text{O}3) = 2.559 \text{ \AA}$; $\alpha(\text{O}4-\text{H}4\text{O}\cdots\text{O}3) = 151^\circ$). During a database search for the molecular core scaffold, three crystal structures were found viz. 12-Benzoyl-2-methylbenzo[1,2-*a*]indole-6,11-dione [8]; 12-(4-Chlorobenzoyl)-2-methylbenzo[*f*] pyrido[1,2-*a*]indole-6,11-dione [7] and 12-(4-Methoxybenzoyl)-2-methylbenzo[*f*] pyrido[1,2-*a*] indole-6,11-dione [9]. With a hydroxy group instead of methyl, methyl/chloro or methyl/methoxy group, the title crystal shows a different hydrogen bonding scheme.
