Abstract. This paper presents an ornithological inventory taken between March and December of 2017 in the Brazilian state of Paraná. Although the surroundings contain one relatively well-known location in regard to ornithology, Iguaçu National Park, several other areas merit exploration, among them the Santa Helena Relevant Ecological Interest Area (ARIE-SH). The 1,479 ha ARIE-SH is essentially a large remnant of the Atlantic Forest located adjacent to the city of Santa Helena, Paraná, which commencing in the 1980s has undergone considerable reforestation with both native and exotic species, including fruit species. Prior to censusing bird species and to better characterize the avian community, we conducted a bibliographic review of earlier ornithological studies carried out at ARIE-SH. In addition, we conducted opportunistic and unsystematic observations in nearby locations. We recorded 311 species of birds. During the current inventory, and others conducted in the area since 2016, we recorded six Atlantic Forest endemic species, five species threatened in Paraná, and two globally threatened species. Common species which showed high Index of Frequency in Lists include (in descending order) *Basileuterus culicivorus*, *Leptotila verreauxi*, *Cnemotriccus fuscatus*, *Corythopis delalandi*, *Turdus leucomelas* and *Arremon flavirostris*. Nine species observed while conducting this census (*Laterallus exilis*, *Amazona vinacea*, *Herpsilochmus longirostris*, *Campylorhamphus trochilirostris*, *Casiornis rufus*, *Campylorhynchus turdinus*, *Myiothlypis flaveola*, *Eucometis penicillata* and *Sporophila palustris*) are the first records for this region.

Keywords. Relevant Ecological Interest Area; Citizen Science; Diamante d'Oeste; Biological Refuge; Santa Helena.

INTRODUCTION

Scherer-Neto & Straube (1995) divided the development of ornithology in the state of Paraná into four phases: The “Natterer period” (encompassing all regional ornithological works from the 19th century), the “Chrostowski period” (beginning of the 20th century to the 1930s), the “Mayer Period” (between the 1940s and 1960s) and the “Current Period” (commencing in the 1970s). The most outstanding investigations of the state’s wild birds occurred during the first three chronological periods.

The first ornithological investigations of Paraná were conducted by the Austrian naturalist Johann Natterer. During his stay in Paraná between September 1820 and May 1821 he visited numerous localities along its coastal plain (Serra do Mar). He also passed through the state’s interior lands west of the Serra do Mar collecting zoological material (Straube, 1993). Between 1921 and 1924, Polish naturalists Tadeusz Chrostowski and Tadeusz Jaczewski, sent by the Polish Museum of Natural History, searched a wide region from the state’s center to its far west, as well as along the

Ivaí, Piquiri, and Paraná rivers. During this expedition, they obtained approximately 260 bird taxa, which resulted in the first great ornithological collection for Paraná in this century (Scherer-Neto & Straube, 1995). In 1930, Emil Kaempfer carried out an extensive ornithological expedition in Paraná. He crossed the state from east to west, collecting material from the coastal plain to the western seasonal forests surrounding Foz do Iguaçu (Straube, 2015, 2016, 2017).

Until the mid-20th century, western Paraná was richly endowed with a variety of bird species, among the most diverse in the Brazilian south and southeast regions (Scherer-Neto *et al.*, 2011). This was largely due to the 180,000 ha of continuous vegetation currently constituting Iguaçu National Park (PNI). This region has been a center of ornithological studies since the 20th century (Scherer-Neto & Straube, 1995), initiated primarily by naturalists and later by ornithologists investigating the local avifauna community (Straube *et al.*, 2004).

Only 28% of the original Atlantic Forest vegetation cover still stands (Rezende *et al.*, 2018) and, in Brazil, the remaining forest is now fragmented

into mostly small (< 50 ha), isolated parcels (Ribeiro *et al.*, 2009). Up to the 1960s, a mosaic of large primary forest fragments remained in Paraná's northeast (Gubert-Filho, 2010); however, the current scenario is quite different.

Prior to the 21st century, the avifauna of western and northwestern Paraná (a region which encompasses distinct biomes and types of soil), and especially areas surrounding the Paraná river, was characterized by Sztolcman (1926), Naumburg (1937, 1939), Pinto & Camargo (1956), Scherer-Neto (1983), Anjos & Seger (1988) and Straube & Bornschein (1989, 1995). In the current century, studies have focused on the PNI (Straube & Urben-Filho, 2004; Straube *et al.*, 2004) and more specific reports have been produced (Bencke *et al.*, 2008; Cândido-Jr. *et al.*, 2008; Von Mitter *et al.*, 2010; Girardi & Carrano, 2014; Lindsey *et al.*, 2019).

Our study is intended to compliment the studies noted above by inventorying birds in a little studied, avifauna rich area in Paraná: ARIE-SH. Prior to conducting the inventory of ARIE-SH avifauna, we reviewed relevant avifauna information based on literature, citizen science online databases, and natural history museum collections. Less rigorous, non-systematic censuses in locations near ARIE-SH where no previous ornithological studies have taken place were also performed and are included.

MATERIAL AND METHODS

Study area

ARIE-SH is the focus of our inventories. ARIE-SH contains 1,479 ha and was once contiguous with the Atlantic Forest semideciduous forests. It is located in the Brazilian state of Paraná's southwest, centered on latitude 24°51'04"S and longitude 54°21'05"W, about 1 km NW of the city of Santa Helena, between Foz do Iguaçu and Ilha Grande National Parks. The entire area of ARIE-SH is surrounded by water, a canal at the southeast margin and a lake at the other mar-

gins. There is a forest opposite ARIE-SH to the west and a reforested strip opposite it to the other compass points, with the water, forest, and reforested strip acting as environmental buffers. Six areas adjacent to ARIE-SH are also non-systematically inventoried (Fig. 1).

Santa Helena County in an area that had experienced rather extreme topographic alteration. Inserted in the hydrographic basins of the Paraná and Iguaçu rivers (western Paraná) located on the left bank (east) of the Paraná river, Santa Helena County (centered at 24°51'37"S, 54°19'58"W) had about one third (260 km²) of its territory flooded in 1982 after damming of the Paraná river with construction of the Itaipu hydroelectric facility (Cavarzere *et al.*, 2020).

In order to shelter and protect regional flora and fauna, as well as to rescue fauna displaced from its habitat due to the formation of this reservoir, the two nation consortia responsible for Itaipu dam (Brazil and Paraguay) officially created seven ecological reserves (Biological Refuges) in the 1980s, two in Brazil (Bela Vista and Santa Helena) and five in Paraguay (Itabó, Limoy, Carapá, Tati Yupí and Yui Rupá); another one, encompassing both countries (Maracaju Binational Reserve) was also created. One of these reserves was initially named Refúgio Biológico Santa Helena (RBSH) and is entirely within Santa Helena County (Fig. 1). The Refuge had an area of 1,479 ha and is isolated from adjacent areas by an excavated channel and a lake, making it an artificial island (Cavarzere *et al.*, 2020).

RBSH was later reclassified as a Relevant Ecological Interest Area, thereby becoming the Santa Helena Relevant Ecological Interest Area (ARIE-SH), a protected area designated for sustainable use within the legal scope of the National System for Protected Areas (SNUC). As such, it is also a government defined Integral Protected Area designed to preserve water and mineral resources, fauna and flora, with sustainable tourism and scientific research being the only permitted human activities (Brasil, 2002). ARIE-SH is also integrated into the

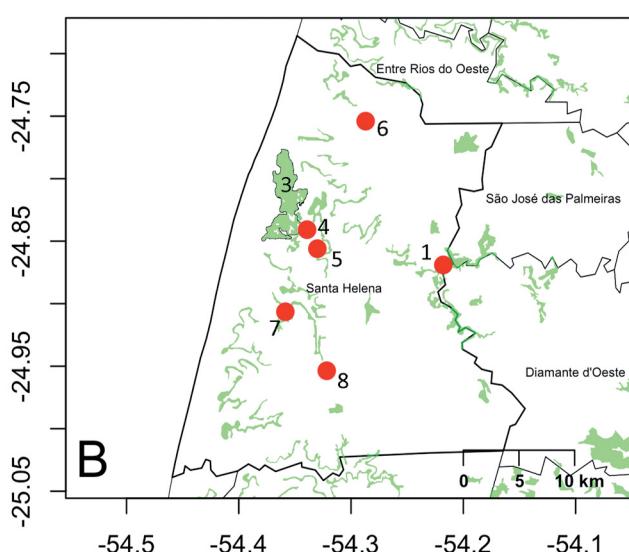

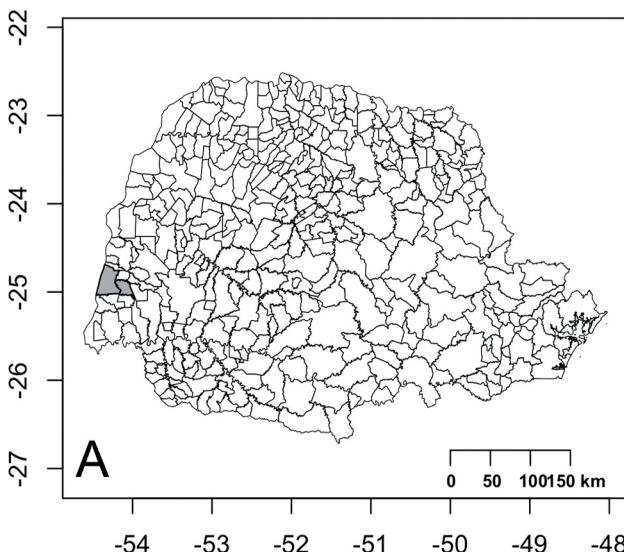

Figure 1. Santa Helena Relevant Ecological Interest Area in relation to the state of Paraná (A) and the counties of Diamante d'Oeste and Santa Helena (B). Green indicates remaining vegetation of over 50 ha.

Paraná Biodiversity Program, which covers more than 2 million ha and connects semideciduous forests to the Araucaria forests along the Iguaçu and Paraná rivers.

According to Koeppen's classification system (Koeppen, 1948; Alvares *et al.*, 2013), the region that includes ARIE-SH is climatically Subtropical Humid Mesothermal (Cfa), with rainfall distributed uniformly throughout the year (average of 1,650 mm). December and January have the highest average rainfall (150 and 175 mm, respectively), and July and August have the lowest (75 and 100 mm, respectively). The region's average temperature is 22°C, with highs reaching 40°C in the summer and lows down to -2°C in the winter; frosts are infrequent (Kliver, 2010).

Flora

ARIE-SH was originally covered by semideciduous seasonal forests (IBGE, 2012). By the mid-1970s, a large part of this area had been clear-cut to accommodate agriculture. Since then, more than 6,680 ha of forests have naturally regenerated (Kliver, 2010; Fundação SOS Mata Atlântica, 2020). In 1974 construction began at the Itaipu Binacional hydroelectric dam, 120 km to the south of Santa Helena. To permit construction of the dam and filling of the lake behind it, the area that includes ARIE-SH was expropriated.

In 1981, reforestation began at what would become ARIE-SH. The reforestation project introduced 18 exotic and 24 native species (eight fruit trees) on 183 approximately 100 × 50 m plots. The most used exotic species were Coffee bush *Leucaena leucocephala* (Lam.) de Wit, Malabar plum *Syzygium cumini* (L.) Skeels and Rosewood *Tipuana tipu* (Benth.) Kuntze. The main native species plots were guabiroba *Campomanesia xanthocarpa* Mart. Ex O. Berg and Brazilian cherry *Eugenia uniflora* L. More currently, the areas of vegetation have undergone natural regeneration and are in various stages of succession (Kliver, 2010; Tambarussi *et al.*, 2019).

In her study of ARIE-SH, Kliver (2010) noted the predominance of vegetation in the secondary stage of regeneration and that the original native vegetation could be found in small lowland areas with a predominance of herbaceous substrate in soaked soil. More recently, Tambarussi *et al.* (2019) determined that approximately 74% of ARIE-SH's area could be classified as an Extensive Use Zone where reforestation with exotics resulted in very poor forest regrowth, 22.4% classified as being a Natural Zone, 3.3% classified as being a Recovery Zone, and only 0.1% classified as an Intangible Zone. When contrasted with areas planted with exotic species, areas that were replanted with native species showed more advanced regeneration, with herbaceous and shrub species occupying the understory, a marked presence of terrestrial ferns, and the richest number of tree species – thus presenting an intermediate successional stage (Tambarussi *et al.*, 2019).

Contrarily, the stands of exotic species show low species diversity in the understory and little natural regener-

ation, even after decades of reforestation. Exceptions are the plots with Coffee bush, the seeds of which were used for germination and dispersion studies (Dalmolin *et al.*, 2011). This species is small and leads to an open canopy that allows for the greatest entry of light and the understory's consequent development. With the senescence of the first planted specimens in these plots, space opened for large-scale natural regeneration. Exotics plots with less diversity are those planted with Malabar plum and mango *Mangifera indica* L., where practically nothing grows in the shaded understory. In these plots, the soil is covered only by thick litter, making it difficult to establish other forms of life. Additionally, allelopathy, systemic with the cultivation of Coffee bush (Scherer *et al.*, 2005) and, especially, Malabar plum, cannot be disregarded as a cause of low regeneration in these areas (Cavarzere *et al.*, 2020).

Reviews

Literature

We searched for ornithological records associated with ARIE-SH using databases such as: Directory of Open Access Journals (DOAJ, <https://doaj.org>), JSTOR (<https://www.jstor.org>), PubMed (<https://www.ncbi.nlm.nih.gov/pubmed>), Scielo (<https://scielo.org>), ScienceDirect (<https://www.sciencedirect.com>), Scopus (<https://www.scopus.com>), Web of Science (<https://login.webofknowledge.com>), and Google Scholar (<https://scholar.google.com>). We also considered using Google (<https://www.google.com>) for grey literature.

Online database

We searched for bird records associated with ARIE-SH until March 27, 2020 on citizen science online databases (critically revising misidentifications), such as Internet Bird Collection (<https://www.hbw.com/ibc>), Wiki Aves (<http://www.wikiaves.com.br>), E-bird (<https://ebird.org>), Xeno-canto (<https://www.xeno-canto.org>), and Macaulay Library (<https://www.macaulaylibrary.org>). We used the following keywords: birds, avifauna, ornithology, Biological Refuge Santa Helena, ARIE Santa Helena, and their respective Portuguese translations.

Natural History Museums

We searched for specimens collected from ARIE-SH and Santa Helena County in the Museu de História Natural Capão da Imbuia (MHNCl), and Museu de Zoologia da Universidade de São Paulo (MZUSP).

Bird census

Land birds

About 15 min before sunrise we inventoried the land birds of ARIE-SH on pre-existing trails for a total of 14 one-day visits (which lasted for 3 h each) between March

Table 1. Dates of censuses conducted on trails and along the margins of the Santa Helena Relevant Ecological Interest Area in 2017.

Campaign	Date	Census type
I	March 10 th	land
II	March 24 th	land
III	May 12 th	land
IV	May 13 th	land
V	May 25 th	land
VI	July 9 th	land
VII	June 21 st	water
VIII	June 23 rd	water
IX	July 31 st	water
X	August 31 st	water
XI	September 30 th	water
XII	November 11 th	water
XIII	November 15 th	land
XIV	December 15 th	water

and December of 2017 (Table 1). We used 5-species lists (Mackinnon & Phillips, 1993) when the observer takes notes of all seen or heard species. Each list contains five species, and one species cannot be repeated in the same list but can appear in subsequent ones. We generated Index of Frequency in Lists (IFL) by dividing the number of lists in which a given species occurred by the total number of accumulated lists (Ribon, 2010).

Water birds

We inventoried the water birds linked with ARIE-SH following the Scott & Carbonell (1986) directory who used the Ramsar Convention, which suggests that water birds are those that depend on wetlands, to determine the families and, consequently, the species of aquatic avifauna. Except for time of beginning censuses, we deliberately used Lara's (1994) methodology so that water bird communities could be compared over an interval of approximately 33 years. We determined transects around the ARIE-SH perimeter (32 km) and navigated by motorized boat at a constant speed of about 5 km/h, covering a total of 256 km in all campaigns (Table 1). Inventorying took place between 13:00 and 17:00, starting on the eastern margin, going around ARIE-SH's perimeter, and ending on its western margin. On a rainy day (September 30), we were forced to interrupt the inventory at the halfway point. The same observers (ISQ and VC) conducted censuses using 8 × 20 and 8 × 42 binoculars. Whenever pos-

sible, we photographed species and taped their vocalizations with a digital recorder and directional microphone.

Qualitative census

We additionally took occasional, non-systematic observations at six locations close to ARIE-SH (Fig. 1, Table 2).

Analysis

We used the Jaccard Similarity Index defined according to Krebs (1989) to compare the aquatic bird community over an interval of approximately 33 years,

$$S_{ji} = \frac{a}{a + b + c}$$

where S = Jaccard Similarity Index between campaigns i and j ; a = number of species that occur in both campaign i and campaign j (co-occurrence); b = number of species that occur in campaign j but are absent in campaign i ; c = number of species that occur in campaign i but are absent in campaign j . We did not compare the terrestrial community between periods due to the heterogeneity of methodologies used in relevant studies and the fact that the present censuses did not sample the entire ARIE-SH area.

We used the Vegan package (Oksanen *et al.*, 2007) within the R environment (R Core Team, 2019) to build species accumulation curves and calculate the similarity index. We further used the warbleR package (Araya-Salas & Smith-Vidaurre, 2017) to present the spectrogram.

We used the proposal by Piacentini *et al.* (2015) for bird taxonomy. Atlantic Forest endemic bird species are in agreement with Vale *et al.* (2018) and threat status follows global (IUCN, 2019), national (Brasil, 2014) and state (Paraná, 2018) references.

RESULTS

Reviews

Literature

Scherer-Neto's (1997) data provided the foundation for our ARIE-SH avifauna information. The author ob-

tained a total of 143 species over four campaigns carried out every three months. During each campaign, the author covered ARIE-SH trails over three consecutive days (but also in adjacent areas, therefore, outside the ARIE-SH), alternating the starting points between the beginnings and the ends of the trails. He recorded bird species using transect counts and mist-netting and carried out transects in different environments.

In a study restricted to water species, Lara (1994) also inventoried locations near ARIE-SH, observing 28 bird species specifically at ARIE-SH. The author censused every three months over one year using the method we chose to use to census water birds.

Censusing at both ARIE-SH and at the Bela Vista Biological Refuge (RBBV) in the county of Foz do Iguaçu, Paraná, Seger et al. (1993), including Scherer-Neto's (1997) records, logged a total of 280 bird species but did not distinguish between the two locations in their records.

The most recent available ARIE-SH avifauna data are from Kliver's (2010) inventoried carried out in 1998 and in 2010. The author recorded 269 (24 orders and 61 families) species in 1998 and 197 (20 orders and 51 families) species in 2010, for a total of 271 species in 24 orders and 62 families. Between October 2009 and January 2010, the author conducted 80 visits to ARIE-SH at different times of the day, with a mean duration of 1.5 hours each. Observers carried out transects covering 53 km of trails with a constant speed of about 1.5 km/h. Kliver (2010) followed the same sequence on transects, alternating days of drought and rain and censusing during the mornings and afternoons.

Online database

As of March 27, 2020, only Wiki Aves showed bird records (97 species) from Santa Helena County. However, the data supplied by the citizen scientists did not accurately report observation locations; we therefore did not incorporate Wiki Aves records in our compilation.

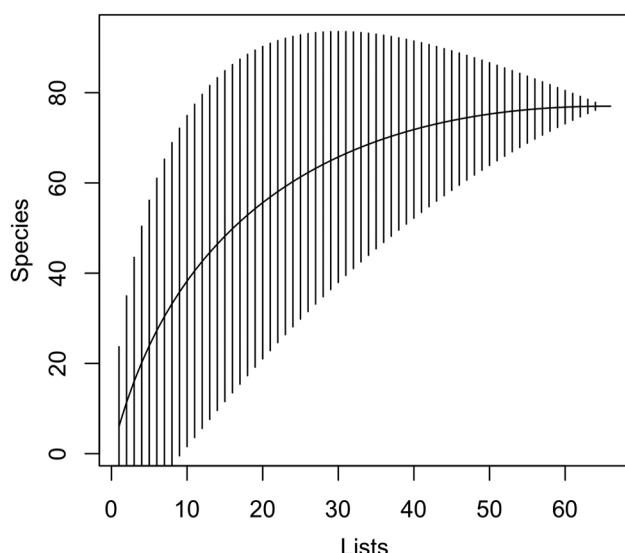

Figure 2. Accumulation curve of species recorded during terrestrial census at the Santa Helena Relevant Ecological Interest Area, Santa Helena County.

Natural History Museums

We found two specimens (MZUSP 75893 and MZUSP 75894) of Great Dusky Swift *Cypseloides senex* collected on April 28, 1982 at the mouth of the São Francisco Falso River in Santa Helena County, as well as another eight species from Santa Helena housed at MHNCL, of which four were collected at ARIE-SH between 1987-1991 (Appendix).

Bird census

We recorded a total of 125 bird species in at ARIE-SH using two methodologies. Three species are Atlantic Forest endemics (*Aramides saracura*, *Picumnus temminckii*, and *Tachyphonus coronatus*) and one is endangered at state level (*Busarellus nigricollis*). We recorded no nationally or globally threatened species at ARIE-SH.

Land birds

We accumulated 65 five-species lists, recording 78 species while hiking trails at ARIE-SH. Two Atlantic Forest endemic forest species were recorded only during the land bird census (*P. temminckii* and *T. coronatus*). The species accumulation curve shows a tendency towards stabilization (Fig. 2). IFL values varied from one (0.016) to 23 (*Basileuterus culicivorus*, 0.359) records in lists (Appendix).

Water birds

During the inventories taken while traveling around the shore of ARIE-SH, we recorded 74 species in 15 orders and 32 families. Twenty-two of the birds recorded were "water birds" as defined following Scott & Carbonell's (1986) classification of aquatic birds. We recorded the regionally endangered *Busarellus nigricollis* exclusively on

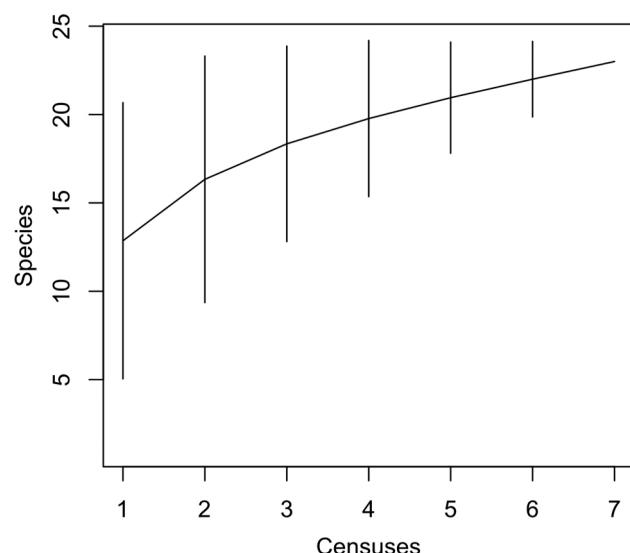

Figure 3. Accumulation curve of aquatic species recorded on the margins of the Santa Helena Relevant Ecological Interest Area, Santa Helena County.

ARIE-SH's margins. The species accumulation curve for aquatic species did not show stabilization (Fig. 3).

Qualitative census

Our records (including occasional, non-systematic observations) and compilations resulted in the identification of 311 bird species for ARIE-SH and surroundings. The number of endemic species rises to six (*A. saracura*, *P. temminckii*, *Amazona vinacea*, *Automolus leucophthalmus*, *Myiornis auricularis* and *T. coronatus*). Regarding state level threatened species, we compiled one critically endangered species (*Sporophila palustris*), one endangered species (*B. nigricollis*) and four vulnerable species (*A. vinacea*, *Campylorhamphus trochilirostris*, *Casiornis rufus* and *Sporophila leucoptera*). At the national level, no threatened species were encountered. At the global level, two species are listed as endangered (*A. vinacea* and *S. palustris*). We recorded 17 species in the area that had not been registered (Appendix).

Analysis

Lara (1994) recorded 28 aquatic bird species (eight exclusive) while we detected 22, of which two were only recorded by us (Table 3). The similarity index between current and previous water bird censuses was $Sji = 0.67$.

DISCUSSION

There are a few exceptional preterit records which merit mention as they are no longer present regionally, such as the Scaled Pigeon *Patagioenas speciosa* and the Crested Eagle *Morphnus guianensis*, both obtained

in Marechal Cândido Rondon, some 25 km east of Santa Helena (Straube & Bornschein, 1989, 1995). Another important record is that of the Large-tailed Antshrike *Mackenziaena leachii*, obtained in Foz do Iguaçu, Pato Bragado, Marechal Cândido Rondon and Guaíra by Kaempfer (Naumburg, 1937). The Plumbeous Pigeon *P. plumbea* is also worth mentioning, deposited at MHNCI and currently quite rare in interior Paraná. Some 100 km further east, Pinto & Camargo (1956) presented several species collected in Porto Camargo (Icaraíma municipality), such as the Undulated Tinamou *Crypturellus undulatus*, the Three-toed Jacamar *Jacamaralcyon tridactyla*, the Helmeted Woodpecker *Celeus galeatus*, the Black-capped Antwren *Herpsilochmus atricapillus*, the Russet-mantled Foliage-gleaner *Syndactyla dimidiata* and the Crested Oropendola *Psarocolius decumanus*. Scherer-Neto et al. (1997) reported three important (undocumented) singletons: White-browed Woodpecker *Piculus aurulentus*, Rufous-headed Tanager *Hemithraupis ruficapilla* and Green-throated Euphonia *Euphonia chalybea*, Atlantic Forest endemics which currently do not have records in this region of the state. Such species are of paramount importance for characterizing the avifauna once present. Therefore, they indicate community composition changes which resulted from habitat modification.

Reforestation

ARIE-SH lies approximately 80 km northeast from PNI, an area containing 335 bird species (Straube et al., 2004). This great species richness is a reflection of PNI's large size, abundant native vegetation and diversity of habitats, which include mixed and seasonal forests. However, because ARIE-SH and PNI are close to one another and share a seasonal forest biome, their avifauna compositions should have been similar before ARIE-SH was deforested (Willis, 1979). In addition, small (≥ 20 ha) reforested seasonal semideciduous Atlantic Forest remnants in northern Paraná do have equal or higher bird richness and similar functional group structures when compared to contiguous native vegetation. Thus, they can maintain levels of biodiversity and reduce species extinction debt (Santos-Júnior et al., 2016). Furthermore, as long as contiguous to native fragments, interior Atlantic Forest reforested areas in São Paulo state with native and exotic plant species proved to be ecologically more functional for birds and to contribute to the maintenance of resident and visiting species by providing food resources (Athié & Dias, 2012). Since we recently recorded only 125 species within ARIE-SH, we present a few arguments why such differences currently occur.

Some trophic guilds-specialized forest species, such as large frugivores and understory insectivores, tend to disappear from degraded environments (Willis, 1979; Ribon et al., 2003). Some of these species were only recorded in past ARIE-SH censuses, such as the large frugivores *Crypturellus obsoletus* and *Penelope superciliaris*. The former, a terrestrial species having low sensitivity to forest fragmentation (Anjos, 2006), uses small forest remnants (10 ha) as long as there is continuous connec-

tion among forest patches (Barbosa *et al.*, 2017). Because there is continuous reforested vegetation bordering the eastern margins of the lake connecting ARIE-SH to PNI, this species' absence strongly suggests habitat modification. Although *Penelope superciliaris* avoids habitat modification (Pereira-Ribeiro *et al.*, 2018), it can be found in small forest remnants (Anjos, 2001) and even in disturbed ones (*pers. obs.*). Both *C. obsoletus* and *P. superciliaris* are game birds and, especially in the case of *P. superciliaris*, invite intense poaching activity, which may play a major role in their dearth (Pereira-Ribeiro *et al.*, 2018). This conclusion is corroborated by the fact that *P. superciliaris* was quickly sighted during our visits to nearby locations (Appendix) that do not suffer the hunting pressure. The ecological consequences of this species absence are of paramount importance as both species are able to swallow fruits with large seeds that smaller bird species cannot disperse, greatly contributing to the fruit's trees spreading throughout its environment (Pizo, 2004).

Dendrocolaptids and thamnophilids are examples of understory insectivorous. Species belonging to this tropic guild are among the first to disappear from forest fragments at the earliest sign of habitat modification (Stouffer *et al.*, 2011). Therefore, a more permeable matrix facilitates their dispersal within landscapes. Not only matrices, but passive restoration, is a cheap and effective solution to recover some taxocenes in the Atlantic Forest (Guerrero & Rocha, 2010). We did not record any dendrocolaptid species and only three thamnophilids, with *T. caerulescens* being the most common. This species is less sensitive to forest fragmentation (Ribon *et al.*, 2003; Anjos, 2006), occurring in several small fragments (Barbosa *et al.*, 2017) and, apparently, is not affected by changes in the vegetation's structure at ARIE-SH.

In an area of similar size to ARIE-SH in the municipality of Rio Claro, São Paulo state, a *Eucalyptus* sp. woodlot with native understory in interior São Paulo state, the bird community is impoverished when compared with a 10-times smaller native remnant (Willis, 2003), a trend in Neotropical forests (Iezzi *et al.*, 2018). The fact that non-deciduous tree species (permanent canopy cover precluding the passage of sunlight) have been used for the reforestation of ARIE-SH resulted in the absence of a native understory. A clear understory contributes to the loss of bird species in such environments, as already reported for the Brazilian state of Espírito Santo (Marsden *et al.*, 2001) and for Argentina (Iezzi *et al.*, 2018). Although *Eucalyptus* sp. forests can be important within a matrix context, meaning bird species can use them to move among fragments (Barbosa *et al.*, 2017), this is not the case in ARIE-SH, which is surrounded by water and in extremely close proximity to monocultures on the east, such as soybean and maize. Because large-scale (at least 10-year-old) tree planting in corridors adjacent to mature forests results in rapid increased abundance and expanded distribution of forest birds (Pejchar *et al.*, 2018), we draw attention to the need to investigate whether the plant species used for reforestation are adequate for fauna usage of the protection strip bordering Itaipu dam and whether it is being used for travel among National Parks.

Although other empirical studies have observed that habitat modification can lead to an absence of specialist species, it is possible that the noted absence of a species in ARIE-SH is due to recording error or observational failure and that the species was present. Observational failure can be caused by (1) imperfect detection, especially evident when the chance of detecting a species is less than 1 (Mackenzie *et al.*, 2017), or (2) because the species are in ARIE-SH microhabitats that we did not visit.

Similarity

The Similarity Index between the composition of the aquatic avifauna found by Lara (1994) suggests that almost 70% of the aquatic avifauna remained the same at ARIE-SH. This index is relatively high when compared to those found by da Da Silva-Jr. (2007), who monitored bird composition within the Caiapó River Valley in the state of Goiás, pre- and post-filling of small lakes behind two dams. The author obtained $Sji = 0.23$, an expressive, but expected, dissimilar result since the author censused bird communities during completely different times: before and after damming.

Lara (1994) visited ARIE-SH some five years after Itaipu dam began filling up. Then, microhabitats which are not currently found, may have been present, such as sand beaches suitable for finding several piper species. We only recorded groups of the White-backed Stilt *Himantopus melanurus* (not on beaches, but afloat on macrophytes) and lone individuals of Solitary Sandpiper *Tringa solitaria*, while Lara (1994) could find another three of these migratory species. In addition, the author detected the Cattle Egret *Bubulcus ibis*, a very common species in pastures which we did not see on aquatic environments. Apart from the Gray-necked Wood-Rail *Aramides cajaneus*, commoner to the northeast of the state (Scherer-Neto *et al.*, 2011), the remaining species we did not record within ARIE-SH were actually seen by us in similar habitats on other locations in the municipality. Similarly, the two species Lara (1994) failed to detect during her censuses probably result from randomness.

Species accounts

***Busarellus nigricollis* (Black-collared Hawk):** Considered endangered in Paraná (Paraná, 2018). This species occurs in almost all of Brazil (Bierregaard *et al.*, 2020), but there are few records of its presence in Paraná. We saw a lone individual on the shores of Lake Itaipu in a bay with exposed stumps surrounded by riparian vegetation (24°47'46"S, 54°21'56"W) in June, August, September and November (Fig. 4). There was an abundance of aquatic macrophytes observed, such as *Eichornia* spp. and *Salvinia* sp. First recorded in Paraná in Altônia in 1989 (Straube & Bornschein, 1995), some five years after Itaipu lake damming. No collector found this large and conspicuous species in this region before, which suggests a

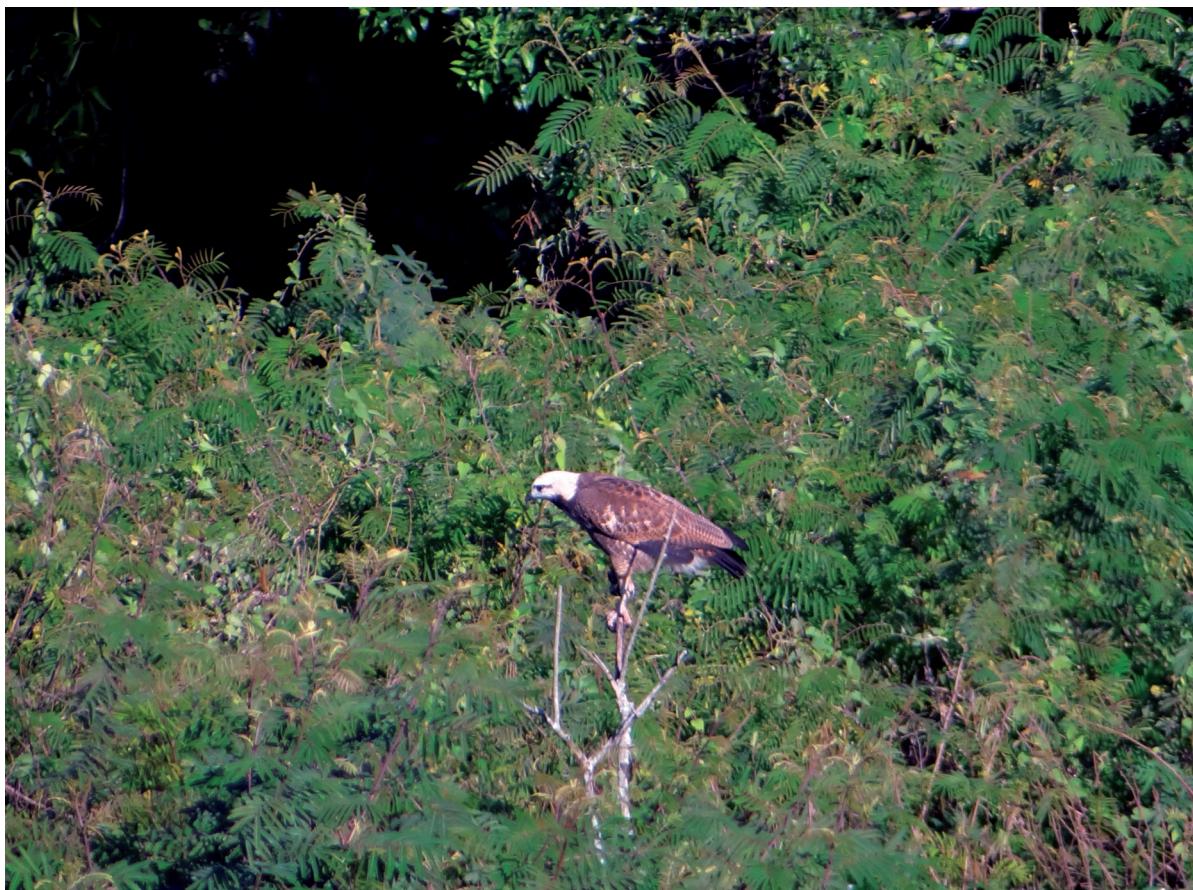

Figure 4. Individual of *Busarellus nigricollis* photographed at Santa Helena Relevant Ecological Interest Area, Santa Helena county. Photo: Wagner Cavarzere.

recent distribution expansion in the state due to water habitats (absent before damming) created by Itaipu dam. Currently, the species seem to occur almost exclusively on the banks of the Paraná (Scherer-Neto & Straube, 1995) and Paranapanema rivers.

***Laterallus exilis* (Gray-breasted Crake):** Data deficient in Paraná (Paraná, 2018). It has been observed in the southern region of the Brazilian Amazonia, eastern Brazil (Taylor, 2020) and in northeastern Argentina (Pearman et al., 2000). We skinned an individual who collided with a wall of a UTFPR – Santa Helena faculty building ($24^{\circ}50'43"S$, $54^{\circ}20'38"W$) on August 29, 2019 (UTFPR-SH-010). This observation took place about 600 km from the nearest prior sighting of this species, Serra do Mar, Paraná (Batista, 2015), and is the first documented record of the species outside Paraná's coastal region (Scherer-Neto et al., 2011; Fig. 5). This species inhabits predictable habitats such as flooded grasslands, rice fields, wetlands, and can be easily detected through the playback technique. Its few records in the state denotes a probable underrepresentation and more individuals may be found in specific searches for the species.

***Amazona vinacea* (Vinaceous-breasted Parrot):** Vulnerable in Paraná (Paraná, 2018). An Atlantic Forest endemic occurring in southeastern Brazil, eastern Paraguay and the province of Misiones in Argentina (Collar et al., 2020). The species has disappeared from most areas in Paraguay and Argentina where they had been historical-

ly recorded. Most notably the Itaipu Reserves Complex in Paraguay is of paramount importance for the species (Cockle et al., 2007). The species has a distribution that is quite coincident with that of *Araucaria angustifolia* (Bertol.) Kuntze. Our observation is one of the few sightings of *A. vinacea* in a Seasonal Semideciduous Forest (Urben-Filho et al., 2008). We saw six individuals flying over the UTFPR-SH campus ($24^{\circ}50'42"S$, $54^{\circ}20'36"W$) on December 14, 2018 (Fig. 6). They were silent and appeared to be coming from either the Limoy Reserve on the Paraguayan side of the Paraná River or from ARIE-SH.

***Herpsilochmus longirostris* (Large-billed Antwren):** Its distribution in Brazil extends from the states of Mato Grosso, Tocantins and Goiás, extending to the south of Ceará and south of Piauí, Paraná and São Paulo (Zimmer & Isler, 2020). Considered endemic to the Brazilian Cerrado (Silva, 1995), it has a characteristic distributions pattern typical of Cerrado species, which arrive in the interior of Paraná traveling down the Paraná River. Known to be found along the banks of the Ivaí and Paraná rivers (Straube & Urben-Filho, 2005), sightings of this species have been logged approximately 70 km to the north in Palotina (Osaki, 2016) and 100 km to the north in Guaíra (Freitas, 2011), evidencing their presence in western Paraná. While traversing ARIE-SH's western marginal trail ($24^{\circ}49'59"S$, $54^{\circ}22'04"W$) on June 9, 2017, we saw, photographed (Fig. 7), and recorded their vocalizations. Our record represents the southernmost record of the species in Brazil.

Figure 5. Male *Laterallus exilis* (UTFPR-56) in ventral (A) and dorsal (B) views registered at the Universidade Tecnológica Federal do Paraná campus, city of Santa Helena.

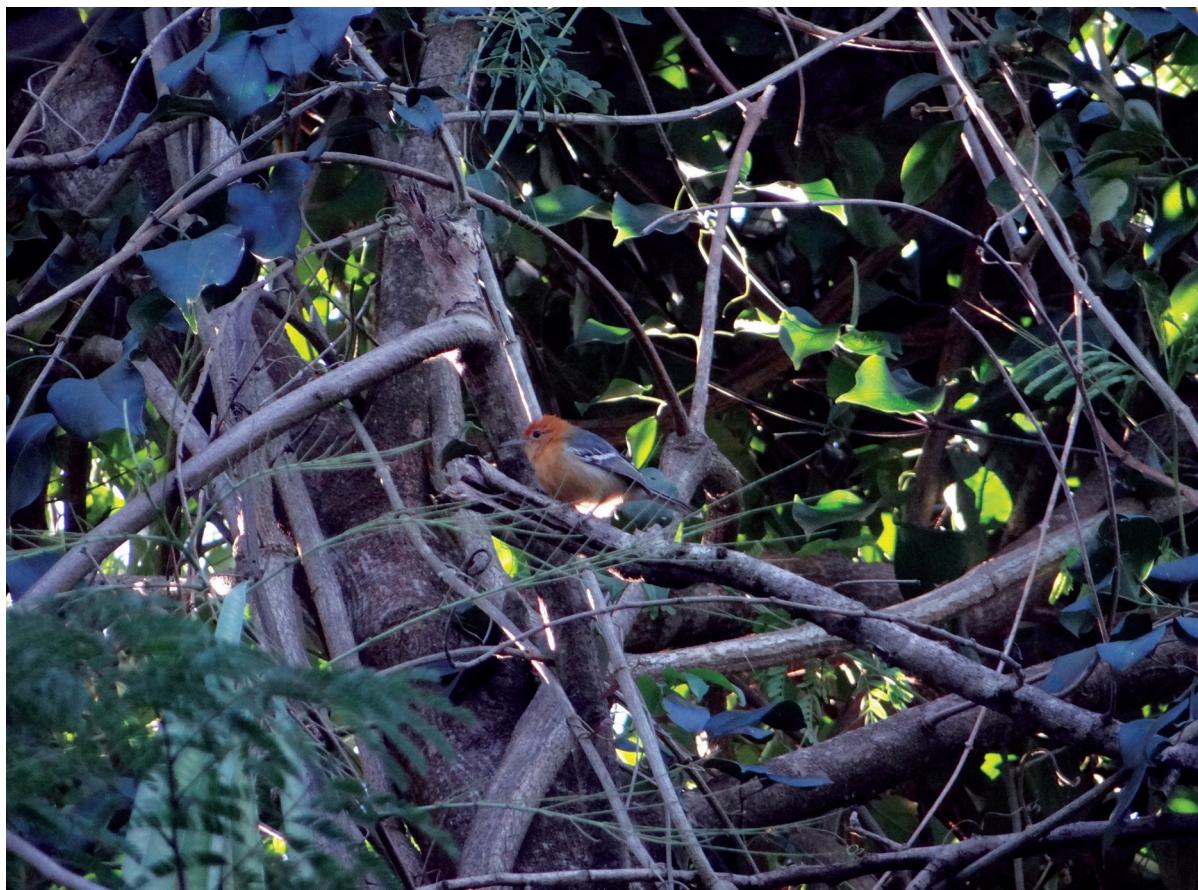

Figure 7. Female *Herpsilochmus longirostris* photographed at Santa Helena Relevant Ecological Interest Area, Santa Helena County. Photo: Vagner Cavarzere.

Campylorhamphus trochilirostris (Red-billed Scythebill): Vulnerable in Paraná (Paraná, 2018), it has the widest distribution of its genus, appearing in all five regions of the country and in 22 Brazilian states (Marantz et al., 2020). Although it has been logged in Paraná's Tibagi River Basin (Anjos et al., 1997), its general distribution pattern indicates that it occurs across Paraná along the Paraná River. Our record is of an individual that collided with a window at the Federal University of Paraná's campus in the city of Palotina and is the southernmost record of this species in Brazil (Fig. 8).

Casiornis rufus (Rufous Casiornis): Vulnerable in Paraná (Paraná, 2018), it is found in Bolivia, central Brazil (Mato Grosso, Goiás, Minas Gerais, Mato Grosso do Sul, Paraná and São Paulo, and recently reported in Rio Grande do Sul), Paraguay and northern Argentina. During the austral winter, it can be found in small numbers in Peru and north and northeastern Brazil (Scholes, 2020). There are few records of the species having been observed in Paraná (Scherer-Neto et al., 2011). We observed two individuals and taped their vocalizations while walking a trail on the east bank of ARIE-SH ($24^{\circ}50'43"S$, $54^{\circ}21'40"W$) on October 20, 2019 (Fig. 9). Our observation is about 250 km south of the previous most southern logged observation in the state (Souza, 2019).

Campylorhynchus turdinus (Thrush-like Wren): Found in Brazil's Amazon region, both to the north and south

Figure 8. Individual of *Campylorhamphus trochilirostris* photographed on the Universidade Federal do Paraná campus, city of Palotina. Photo: André Rüdiger.

of the Amazon River, also in the states of Mato Grosso (Pantanal), Bahia and northern Espírito Santo (Kroodsma et al., 2020). It has been suggested that the geographic expansion of the species towards the south is a result not only of deforestation, but also of climate change (Hayes et al., 2018). The first record of the species in Paraná was from the city of Foz do Iguaçu (Bencke et al., 2008), which is an urban environment. We first observed it (Fig. 10) in Santa Helena's city center ($24^{\circ}51'02"S$, $54^{\circ}20'00"W$) on March 10, 2017.

Myiothlypis flaveola (Flavescent Warbler): It ranges mainly through north, south and eastern Brazil (Curson & Bonan, 2019). The species is typical in dry seasonal for-

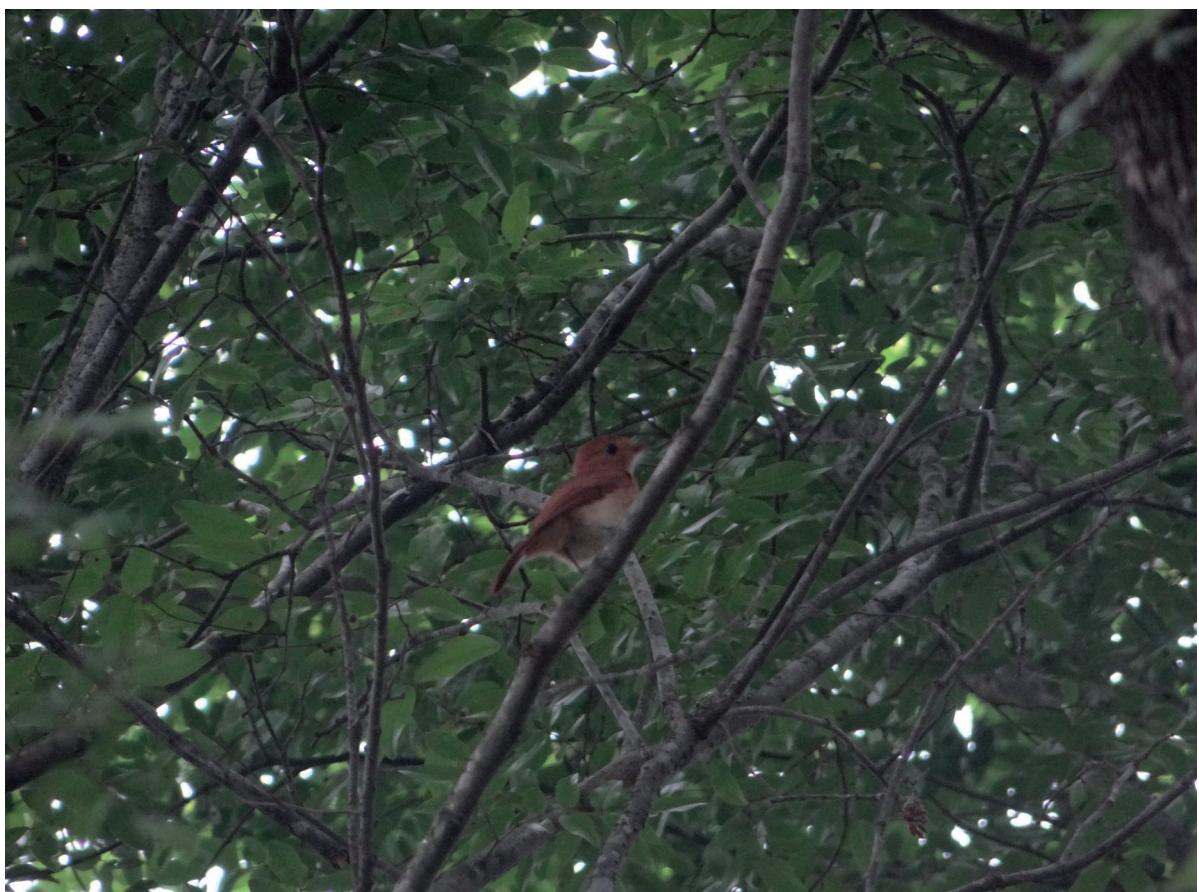

Figure 9. *Casiornis rufus* photographed at Santa Helena Relevant Ecological Interest Area, Santa Helena County. Photo: Vagner Cavarzere.

Figure 10. *Campylorhynchus turdinus* photographed in the city of Santa Helena. Photo: Vagner Cavarzere.

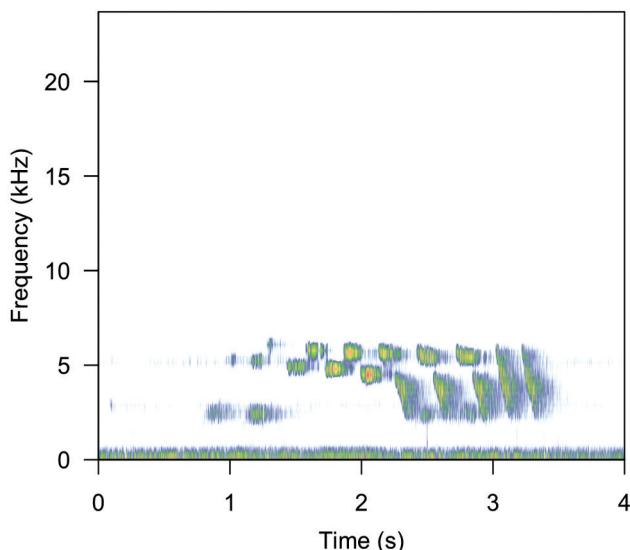

Figure 11. Spectrogram of the vocalization (after playback) of an individual of *Myiothlypis flaveola* recorded at Santa Helena Relevant Ecological Interest Area, Santa Helena County.

ests found in the country's interior, which includes northeastern Paraná, but has not been previously recorded in western Paraná (Fitzpatrick *et al.*, 2004; Scherer-Neto *et al.*, 2011). Model *et al.* (2014) reported its presence in an urban fragment of the city of Cascavel ($24^{\circ}57'20"S$, $53^{\circ}27'19"W$), but this report is not documented. Our record from ARIE-SH ($24^{\circ}50'03"S$, $54^{\circ}21'02"W$) represents

the southernmost record of the species in Brazil, approximately 150 km from the previous southernmost documented sighting (Stencel & Caxambu, 2018). It probably reached western Paraná via the reforested margins of Itaipu Lake. We taped the vocalizations (Fig. 11) of at least two individuals on the 25th of May and 15th of November in 2017 and on the 20th of October in 2019.

***Eucometis penicillata* (Gray-headed Tanager):** This species ranges from western portion of the Brazilian state of Maranhão, to the states of Mato Grosso, Minas Gerais and São Paulo (Hilty, 2020). There are few records of the species from Paraná, and all are centered to the northeast bordering São Paulo state (Scherer-Neto *et al.*, 2011). The previous most southern logged observation was at the Caiuá Ecological Station (Scherer-Neto *et al.*, 2008, 2011) near the city Diamante do Norte, Paraná. We observed and photographed an individual (Fig. 12) on June 8, 2019, in secondary vegetation at Coluna Prestes ($24^{\circ}52'05"S$, $54^{\circ}13'06"W$) near the city of Diamante d'Oeste, almost 400 km south of the Caiuá Ecological Station. Our observation is the southernmost for Brazil.

***Sporophila palustris* (Marsh Seedeater):** Critically endangered in Paraná (Paraná, 2018). *Sporophila palustris* Marsh Seedeater appears in the center and center east and south of Brazil, northern Argentina, and possibly northern Paraguay (Lowen *et al.*, 1996; Jaramillo, 2020;

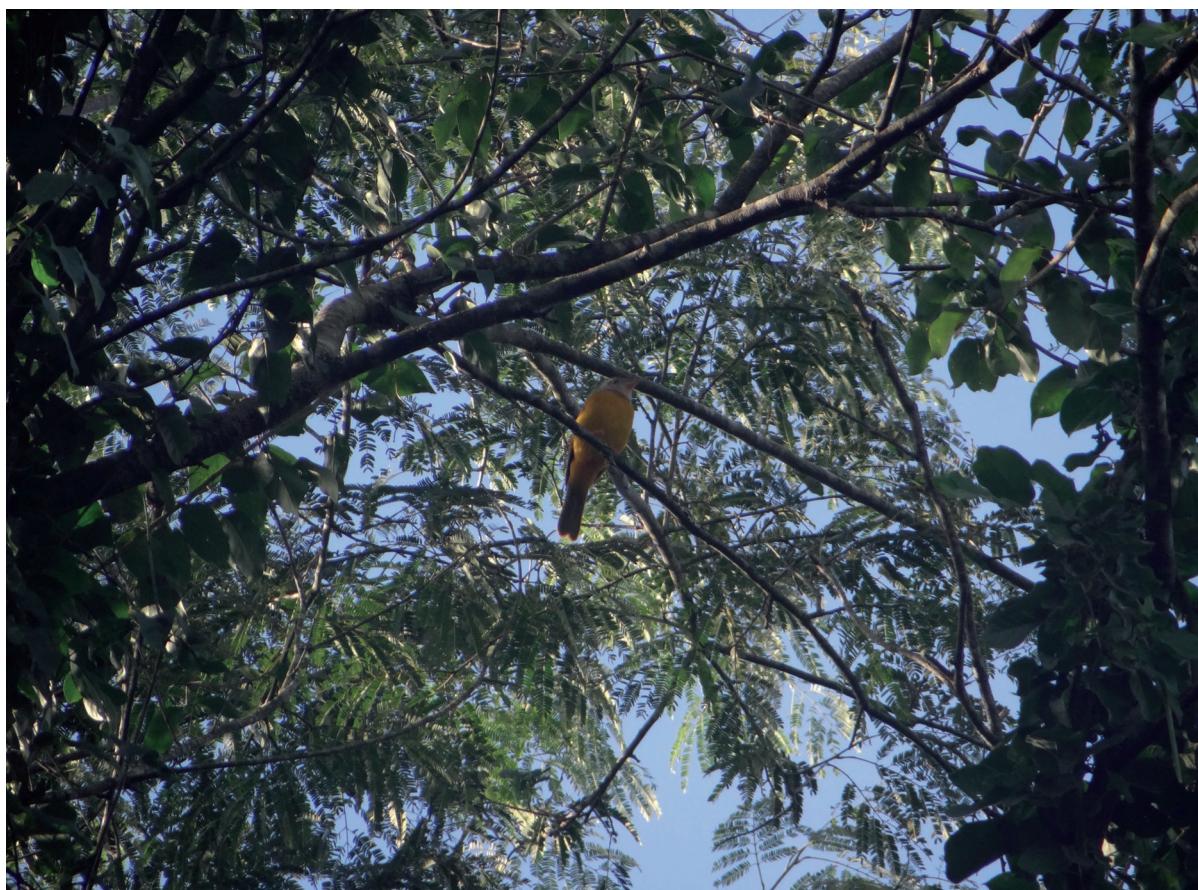

Figure 12. *Eucometis penicillata* photographed at Coluna Prestes, Diamante d'Oeste County. Photo: Vagner Cavarzere.

Figure 13. Male *Sporophila palustris* photographed at the Universidade Tecnológica Federal do Paraná campus, city of Santa Helena. Photo: Vagner Cavarzere.

Vizentin-Bugoni *et al.*, 2013). It breeds in its southern range: Rio Grande do Sul, Brazil, Uruguay, and northern Argentina (BirdLife International, 2017). A sighting of the species in northwestern Paraná was confirmed over two decades ago (Scherer-Neto & Straube, 1995) and again, much more recently, in eastern Paraná. On November 2, 2016, Paludo (2016) observed two *S. palustris* individuals in Campina Grande do Sul near Curitiba in eastern Paraná; two days later, we logged and photographed (Fig. 13) one male *S. palustris* in a small open field on the UTFPR-SH campus. The brief interval and the relatively close proximity of these two *S. palustris* sightings indicates that flocks of the species were likely migrating south at the beginning of their reproductive season. The individual was among hundreds of *S. caerulescens* and dozens of *S. lineola* feeding on native the sourgrass *Digitaria insularis* (L.) Fedde in an area where the exotic 2 m-tall Guinea grass *Megathyrsus maximus* (Jacq.) predominated ($24^{\circ}50'49''S$, $54^{\circ}20'07''W$). We did not spot *S. palustris* on following days. These hundreds of other individuals stayed at this location for one week, after which their numbers were significantly lower. We suspect the site served as a resting point while flying over during a migration route. These grasses were cleared in 2017, and new construction has taken their place.

On the same date we also saw two male *S. collaris* and, on the next day, one male *S. leucoptera*. This *S. leucoptera* observation was 70 km south of its previous

most southern sighting in Paraná, but our sighting is undocumented.

CONCLUSION

There is a relatively great amount of information about the birds of ARIE-SH, but most of it was generated more than 30 years ago, rendering this location as extremely under sampled. The terrestrial bird community at ARIE-SH seems to have undergone a major change over the intervening years, especially with respect to species sensitive to habitat modifications. Some terrestrial species were no longer in evidence (large frugivores and understory insectivores), and others were recorded at ARIE-SH for the first time. From our observations, ARIE-SH's aquatic bird community remains relatively unchanged. Although the site had been reasonably well studied, it is of utmost importance to continuously monitor its bird populations to properly document how their community is being affected by habitat modification in the form of flora fragmentation and composition. The changes in the native forest avian species' populations at ARIE-SH reported in our inventories reinforces the importance of avian surveys taking to gauge the effects of severe habitat modification, such as occurred at ARIE-SH, on bird populations, especially endangered species' populations, if the goal of maintaining avian diversity is to be met.

ACKNOWLEDGMENTS

To Universidade Tecnológica Federal do Paraná campus Santa Helena for financial and structural support. To Fundação Araucária for a scholarship for ISQ. To Edson Poier for making water censuses possible. To Itaipu Binacional for allowing this study to be conducted. To Pedro Scherer-Neto who contributed to the difficult-to-obtain literature used here. To Luís F. Silveira for kindly allowing access to MZUSP bird collection. Antenor Silva-Júnior kindly contributed with specimens' data deposited under his care. For accompanying us traversing Santa Helena and region: Adriana B. Bussler, Ana P. Zingler, Jonas P. Grigolo, Júlio C.S.M. de Souza, Liamara C. Zagonel, Lucas P. de Oliveira, Nathália L.E. Januário and Sara O.G. Maicrovicz. Data on ARIE-SH were exhaustively collected thanks to the fundamental collaboration of Denise Lange, Edicleia Bonini, Héleno Brandão, Leonardo Biral (who also identified the sourgrass species), Rejane B. de Oliveira and Tatiane Tambarussi. To André Rüdiger who alerted us to the record of *C. trochilirostris*. We thank João Maicrovicz and Jaqueline R. dos Santos for contributing with information during the 2020 coronavirus quarantine period. We extend our gratitude to all citizen scientists who, even unintentionally, greatly contribute to our understanding of Brazilian birds. Dione Seripieri kindly provided difficult-to-find references. We conducted our research according to a SISBio permit (56171-1). Anonymous reviewers greatly contributed to the first draft of this manuscript. Christopher C. Fields reviewed the English.

AUTHORS' CONTRIBUTIONS

APPENDIX

List of bird species recorded within Santa Helena Relevant Ecological Interest Area (ARIE-SH) and surroundings. IFL: Index of Frequency in Lists. DdO: Diamante d'Oeste, SH: municipality of Santa Helena, UTFPR: Universidade Tecnológica Federal do Paraná campus. Documentations are A: aural, P: photographed, R: recording, V: visual. Numbers refer to studies. 1: Scherer-Neto (1986, 1987), 2: Lara (1994), 3: Kliver (2010) and 4: this study. MHNCI = Museu de História Natural Capão da Imbuia, MZUSP = Museu de Zoologia da Universidade de São Paulo.

Taxa	English name	IFL	ARIE-SH	DdO	SH	UTFPR	Documentation
Tinamiformes							
Tinamidae							
<i>Crypturellus obsoletus</i>	Brown Tinamou		1,3				
<i>Crypturellus parvirostris</i>	Small-billed Tinamou		1,3				
<i>Crypturellus tataupa</i>	Tataupa Tinamou	0.094	1,3,4		X		A,R
<i>Rhynchos rufescens</i>	Red-winged Tinamou		1,3,4	X		X	A
<i>Nothura maculosa</i>	Spotted Nothura		1,3				
Anseriformes							
Anatidae							
<i>Dendrocygna bicolor</i>	Fulvous Whistling-Duck		1,4				V
<i>Dendrocygna viduata</i>	White-faced Whistling-Duck	0.016	1,2,3,4		X		A,P,V
<i>Cairina moschata</i>	Muscovy Duck	0.016	1,2,3,4				P,V
<i>Sarkidiornis sylvicola</i>	Comb Duck		1,3				
<i>Amazonetta brasiliensis</i>	Brazilian Teal		1,2,3,4	X			A,P,V
<i>Anas bahamensis</i>	White-cheeked Pintail		1				
<i>Netta erythrophthalma</i>	Southern Pochard		3				
<i>Netta peposaca</i>	Rosy-billed Pochard		3				
<i>Nomonyx dominicus</i>	Masked Duck		1,3				
Galliformes							
Cracidae							
<i>Penelope superciliaris</i>	Rusty-margined Guan		3,4	X			A,V
Podicipediformes							
Podicipedidae							
<i>Rollandia rolland</i>	White-tufted Grebe		3		X		MHNCI
<i>Tachybaptus dominicus</i>	Least Grebe		1,3				P,V
<i>Podilymbus podiceps</i>	Pied-billed Grebe		1,3,4				
Ciconiiformes							
Ciconiidae							
<i>Mycteria americana</i>	Wood Stork		3,4				V
Suliformes							
Phalacrocoracidae							
<i>Nannopterum brasilianus</i>	Neotropic Cormorant		1,2,4				P,V
Anhingidae							
<i>Anhinga anhinga</i>	Anhinga		1,2,4				V
Pelecaniformes							
Ardeidae							
<i>Tigrisoma lineatum</i>	Rufescent Tiger-Heron		3,4				V
<i>Ixobrychus involucris</i>	Stripe-backed Bittern		3				
<i>Nycticorax nycticorax</i>	Black-crowned Night-Heron		1,2,3		Sítio Paraná		P,V
<i>Butorides striata</i>	Striated Heron		1,2,3,4				A,P,V
<i>Bubulcus ibis</i>	Cattle Egret		1,2,3,4				P,V
<i>Ardea cocoi</i>	Cocoi Heron	0.016	1,2,3,4				P,V
<i>Ardea alba</i>	Great Egret		1,2,3,4				P,V
<i>Syrigma sibilatrix</i>	Whistling Heron		1,3,4				A,P,V
<i>Egretta thula</i>	Snowy Egret		1,2,3,4				P,V
Threskiornithidae							
<i>Mesembrinibis cayennensis</i>	Green Ibis	0.016	3,4	X			A,V
<i>Phimosus infuscatus</i>	Bare-faced Ibis		4	X			P,V
Cathartiformes							
Cathartidae							
<i>Cathartes aura</i>	Turkey Vulture		1,3,4				P,V
<i>Coragyps atratus</i>	Black Vulture	0.031	1,3,4	X	X		P,V

Taxa	English name	IFL	ARIE-SH	DdO	SH	UTFPR	Documentation
Accipitriformes							
Pandionidae							
<i>Pandion haliaetus</i>	Osprey		1,3,4				P,V
Accipitridae							
<i>Leptodon cayanensis</i>	Gray-headed Kite		3				
<i>Elanoides forficatus</i>	Swallow-tailed Kite		1,4	X			V
<i>Elanus leucurus</i>	White-tailed Kite		3,4		X		V
<i>Ictinia plumbea</i>	Plumbeous Kite		3,4				V
<i>Busarellus nigricollis</i>	Black-collared Hawk		4				V
<i>Rostrhamus sociabilis</i>	Snail Kite		3,4				P,V
<i>Geranospiza caerulescens</i>	Crane Hawk		3				
<i>Urubitinga urubitinga</i>	Great Black Hawk		3,4				V
<i>Rupornis magnirostris</i>	Roadside Hawk	0.031	1,3,4		X		A,P,V
<i>Parabuteo leucorrhous</i>	White-rumped Hawk		3				
Gruiformes							
Aramidae							
<i>Aramus guarauna</i>	Limpkin		2,3,4	X			A,P,V
Rallidae							
<i>Aramides cajaneus</i>	Gray-necked Wood-Rail		1,2,3				
<i>Aramides saracura</i>	Slaty-breasted Wood-Rail		1,2,3,4	X			A,P,V
<i>Laterallus melanophaius</i>	Rufous-sided Crake		3				
<i>Laterallus exilis</i>	Gray-breasted Crake				X		S
<i>Porzana flavigaster</i>	Yellow-breasted Crake		3				
<i>Mustelirallus albicollis</i>	Ash-throated Crake		3,4				A
<i>Pardirallus nigricans</i>	Blackish Rail		1,2,3,4				A
<i>Gallinula galeata</i>	Common Gallinule	0.047	1,2,3,4				A,P,V
<i>Porphyriops melanops</i>	Spot-flanked Gallinule		1,3				
<i>Porphyrio martinicus</i>	Purple Gallinule		1,2,3,4				V
<i>Fulica armillata</i>	Red-gartered Coot		3				
<i>Fulica leucoptera</i>	White-winged Coot		3				
Heliorhithidae							
<i>Heliornis fulica</i>	Sungrebe		1				
Charadriiformes							
Charadriidae							
<i>Vanellus chilensis</i>	Southern Lapwing	0.063	1,2,3,4		X		A,P,V
<i>Pluvialis dominica</i>	American Golden-Plover		3				
<i>Charadrius collaris</i>	Collared Plover		2,3				
Recurvirostridae							
<i>Himantopus melanurus</i>	White-backed Stilt		1,2,3,4				P,V
Scolopacidae							
<i>Gallinago undulata</i>	Giant Snipe		3				
<i>Actitis macularius</i>	Spotted Sandpiper		4				P,V
<i>Tringa solitaria</i>	Solitary Sandpiper		2,3,4				P,V
<i>Tringa melanoleuca</i>	Greater Yellowlegs		1,4				P,V
<i>Tringa flavipes</i>	Lesser Yellowlegs		1,2,3				
<i>Calidris fuscicollis</i>	White-rumped Sandpiper		2,3				
Jacanidae							
<i>Jacana jacana</i>	Wattled Jacana	0.016	1,2,3,4				A,P,V
Sternidae							
<i>Sternula superciliaris</i>	Yellow-billed Tern		2				
<i>Phaetusa simplex</i>	Large-billed Tern		3,4		X		A,V
Rynchopidae							
<i>Rynchops niger</i>	Black Skimmer		1,3				
Columbiformes							
Columbidae							
<i>Columbina minuta</i>	Plain-breasted Ground-Dove		1				
<i>Columbina talpacoti</i>	Ruddy Ground-Dove	0.078	1,3,4	X	X		A,P,V
<i>Columbina squammata</i>	Scaled Dove		1,3,4				A,P,V
<i>Columbina picui</i>	Picui Ground-Dove		1,3,4				A,P,V
<i>Claravis pretiosa</i>	Blue Ground-Dove		3				

Taxa	English name	IFL	ARIE-SH	DdO	SH	UTFPR	Documentation
<i>Patagioenas picazuro</i>	Picazuro Pigeon	0.203	1,3,4	X	X		A,P,V
<i>Patagioenas cayennensis</i>	Pale-vented Pigeon		1,3,4				A,P,V
<i>Patagioenas plumbea</i>	Plumbeous Pigeon				X		MHNCl
<i>Zenaida auriculata</i>	Eared Dove		1,3,4	X			A,P,V
<i>Leptotila verreauxi</i>	White-tipped Dove	0.250	1,3,4	X			A,P,V
<i>Leptotila rufaxilla</i>	Gray-fronted Dove		1,3				
<i>Geotrygon montana</i>	Ruddy Quail-Dove		3				
Cuculiformes							
Cuculidae							
<i>Piaya cayana</i>	Squirrel Cuckoo		1,3,4	X			A,P,V
<i>Coccyzus melacoryphus</i>	Dark-billed Cuckoo		1,3,4	X	X		A,P,V,MHNCl
<i>Crotophaga major</i>	Greater Ani		1,3,4				A,P,V
<i>Crotophaga ani</i>	Smooth-billed Ani	0.031	1,3,4		X		A,P,V
<i>Guira guira</i>	Guira Cuckoo		1,3,4	X	X		A,P,V
<i>Tapera naevia</i>	Striped Cuckoo		1,3,4				A
<i>Dromococcyx pavoninus</i>	Pavonine Cuckoo	0.063	4				A,R
Strigiformes							
Tytonidae							
<i>Tyto furcata</i>	American Barn Owl		3,4		X		S
Strigidae							
<i>Megascops choliba</i>	Tropical Screech-Owl		1,3,4		X	X	A,P,V
<i>Strix hylophila</i>	Rusty-barred Owl		3				
<i>Athene cunicularia</i>	Burrowing Owl		1,3,4				A,P,V
Nyctibiiformes							
Nyctibiidae							
<i>Nyctibius griseus</i>	Common Potoo		3,4		X	X	A,P,V,MHNCl
Caprimulgiformes							
Caprimulgidae							
<i>Lurocalis semitorquatus</i>	Short-tailed Nighthawk		3,4				A,V
<i>Nyctidromus albicollis</i>	Common Pauraque	0.016	3,4			X	A
<i>Hydropsalis parvula</i>	Little Nightjar		3,4			X	A
<i>Hydropsalis torquata</i>	Scissor-tailed Nightjar		3				
<i>Podager naevia</i>	Nacunda Nighthawk		3,4		X		P,V
<i>Chordeiles acutipennis</i>	Lesser Nighthawk		3				
Apodiformes							
Apodidae							
<i>Cypseloides senex</i>	Great Dusky Swift		1		X		MHNCl,MZUSP
<i>Streptoprocne zonaris</i>	White-collared Swift		3				
Trochilidae							
<i>Phaethornis pretrei</i>	Planalto Hermit	0.078	1,3,4	X	X	X	A,V
<i>Phaethornis euynome</i>	Scale-throated Hermit		3				
<i>Florisuga fusca</i>	Black Jacobin		4		X		A,P,V
<i>Anthracocephalus nigricollis</i>	Black-throated Mango		3				
<i>Stephanoxis loddigesii</i>	Violet-crowned Plovercrest		3				
<i>Chlorostilbon lucidus</i>	Glittering-bellied Emerald		1,3		X		A,V
<i>Thalurania glaucopis</i>	Violet-capped Woodnymph		3				
<i>Hylocharis chrysura</i>	Gilded Hummingbird	0.016	1,3,4	X	X		A,P,V
<i>Leucochloris albicollis</i>	White-throated Hummingbird		4		X		A,P,V
<i>Amazilia versicolor</i>	Versicolored Emerald	0.016	1,3				V
Trogoniformes							
Trogonidae							
<i>Trogon surrucura</i>	Surucua Tropicbird	0.094	3,4	X		X	A,P,V
<i>Trogon rufus</i>	Black-throated Tropicbird		3				
Coraciiformes							
Alcedinidae							
<i>Megacyrle torquata</i>	Ringed Kingfisher	0.016	1,2,3,4	X			A,V
<i>Chloroceryle amazona</i>	Amazon Kingfisher		1,2,3,4				A,P,V
<i>Chloroceryle americana</i>	Green Kingfisher		2,3,4				A,V
Momotidae							
<i>Baryphthengus ruficapillus</i>	Rufous-capped Motmot		3		Sub sede		P

Taxa	English name	IFL	ARIE-SH	DdO	SH	UTFPR	Documentation
Galbuliformes							
Bucconidae							
<i>Nystalus chacuru</i>	White-eared Puffbird		3				
Piciformes							
Ramphastidae
