TRANSPORTATION ENGINEERING: TRAFFIC CONTROL SIMULATOR

UNIVERSITY OF
ARKANSAS
COLLEGE OF
ENGINEERING

WHO ARE WE?

**Sarah Hernandez,
Ph.D.**

Assistant Professor
Department of Civil
Engineering
University of Arkansas

Karla Diaz C

Junior Civil Engineering
student at the University
of Arkansas.

Taslima Akter

Research Assistant Ph.D.
in Civil Engineering at
the University of
Arkansas.

Magdalena Asborn

Research Assistant
Ph.D.- Transportation
Planning at University of
Arkansas.

Fu Durandal

Senior Civil Engineering
student with a minor in
mathematics .

WHAT ARE WE GOING TO DO TODAY?

- Learn about transportation engineering and careers offered.
- Introduce essential concepts about signal timing.
- Play with a traffic control simulator.
- Have fun!

HOW DO YOU GET TO THE MOVIE THEATER?

ING STUDY

Built Form	Thoroughfare Connectivity	Land Use Connectivity	Pedestrian Connectivity
Existing Built Form	Existing Streets	Neighborhood Connectivity	Pedestrian Connectivity
Proposed Built Form	Proposed Streets	Subregional Connectivity	Open Space
		Gateway	

WHAT IS TRANSPORTATION ENGINEERING?

VIDEO

Which intersection is “better”?

1

2

Gridlock - A situation of very severe traffic congestion.

GRIDLOCK BUSTER!

Let's see how good you are at controlling traffic!

Who got to
Level 4??

There is a
prize!!

GRIDLOCK BUSTER!

Did you know that Transportation Engineers use simulation to develop more efficient signal timing patterns?

**INTRODUCTION
TO SIGNAL
TIMING & TRAFFIC
CONTROL**

ACTIVITY 1: SIMULATOR INTERACTION. (FOLLOW HANDOUT)

STEM Day – Student Handout

Name: _____ Group: _____

Location: Bell Engineering CVEG computer Lab (2nd Floor).

UNIVERSITY OF ARKANSAS
COLLEGE OF ENGINEERING

Objective:
Complete several experiments to determine how to create a consistent traffic pattern. To keep track of the experiment results, you will take screen captures of graphs and paste them into a word processing document while noting various statistics that the simulation tracks provides, including the score, Performance Index, and ending queue length.

Transportation Planning:
Transportation planning is a sub-discipline of civil engineering. It has the responsibility of the design of the transportation infrastructure.

Signal Timing:
The goal of any traffic system is to **maintain** a safe, consistent, predictable and efficient environment for drivers. Traffic Control lets you act as a traffic engineer by letting you control signals and traffic flow at multiple intersections. We'll use this simulation to test a hypothesis and in doing so, develop a better understanding about how traffic engineers use the scientific process to solve every-day problems.

- Important to know:
 - o Efficiency:
 - o Offset:
 - o Queue:
 - o Performance Index (PI):

- Your teacher will demonstrate how to get started with the simulation and give you a few minutes to explore the controls and features. Activity 1 is on page 2.

Important Terms for Traffic Signal Timing

Delay – When a vehicle has to stop at a red light, the driver experiences delay.

Queue – a line of vehicles waiting at a red light.

Efficiency – How well a traffic signal operates to reduce the amount of traffic delay.

Performance Index - queue length + amount of time delayed.

OBJECTIVES OF TRAFFIC SIMULATION

- Traffic engineers use computer simulations to test new traffic signal timing.
- We follow the scientific method to conduct an experiment → which signal timing is the most efficient?
- Compare graphs generated by traffic patterns to select the most efficient traffic signal timing

OK

Queue Statistics

What happens to the line of vehicles during the red phase? When does the queue reach its maximum length?

Manual Traffic Control

Fixed Traffic Control

- You just performed **Manual traffic control!**
- That's the same as what the police do to control a signal after a Razorback baseball game
- However this is not very efficient...would you like to sit at a traffic signal all day???
- Instead, traffic engineers pre-set the traffic signals → This is called **Fixed Time Control**
- Fixed time control can be more efficient if set correctly.

ACTIVITY 2: THE MOST EFFICIENT SIGNAL

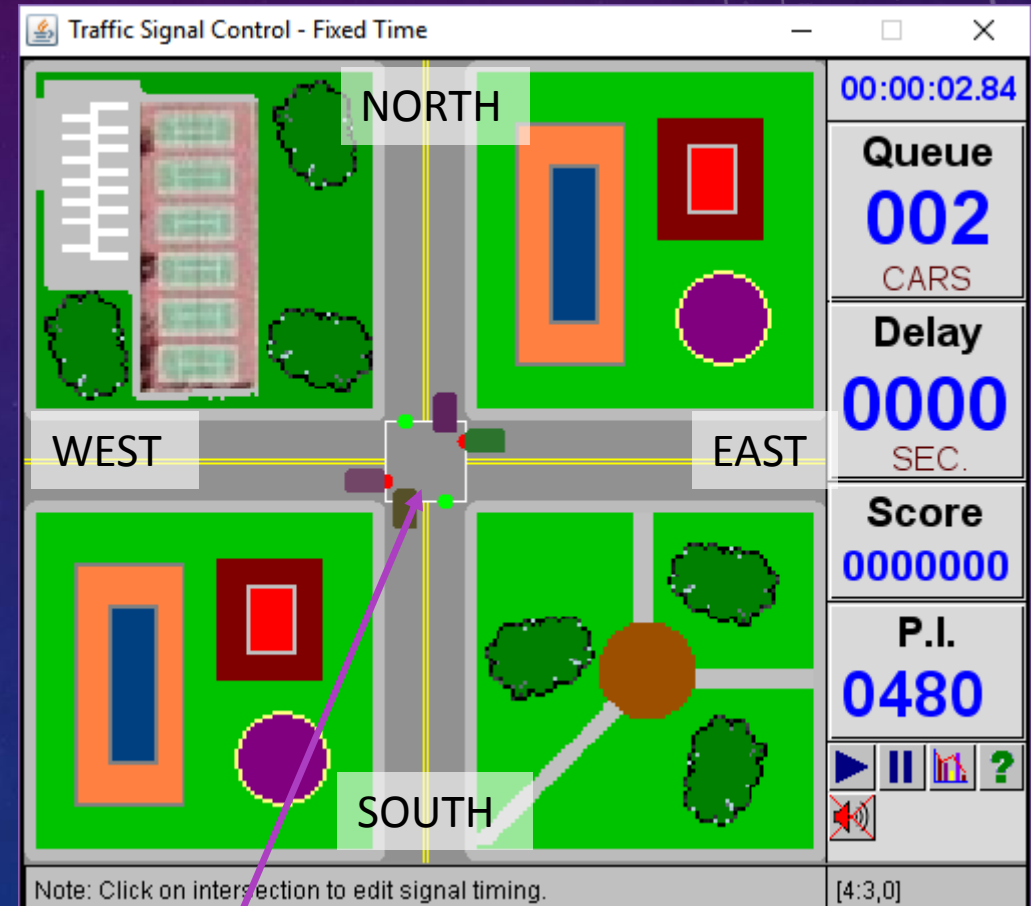

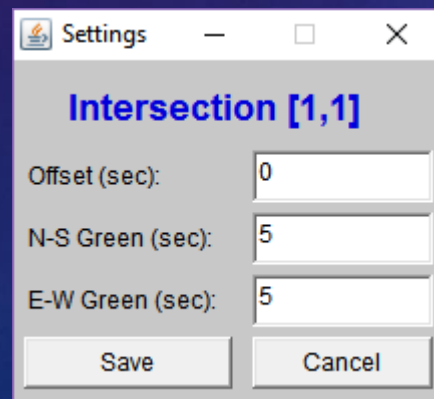

WHAT CAN YOU CHANGE TO IMPROVE THE SIGNAL TIMING?

- You can change the length of the green light for each approach

- In our example, we have two approaches

- East –west
- North- south

Click in the Intersection to change the settings of the signal timing.

- Design your experiment!

1. *Create* a hypothesis
2. *Design* an experiment to test the hypothesis
3. *Perform* the simulation.
4. *Create* whatever graphs you need to confirm or contradict the hypothesis
5. *Form* a conclusion based on your scientific evidence

Following the Scientific Method Group #: _____

Use these headings and questions as a template to develop an experiment using Traffic Control simulation.

Hypothesis: What will you test? In a sentence, state the idea you will test:

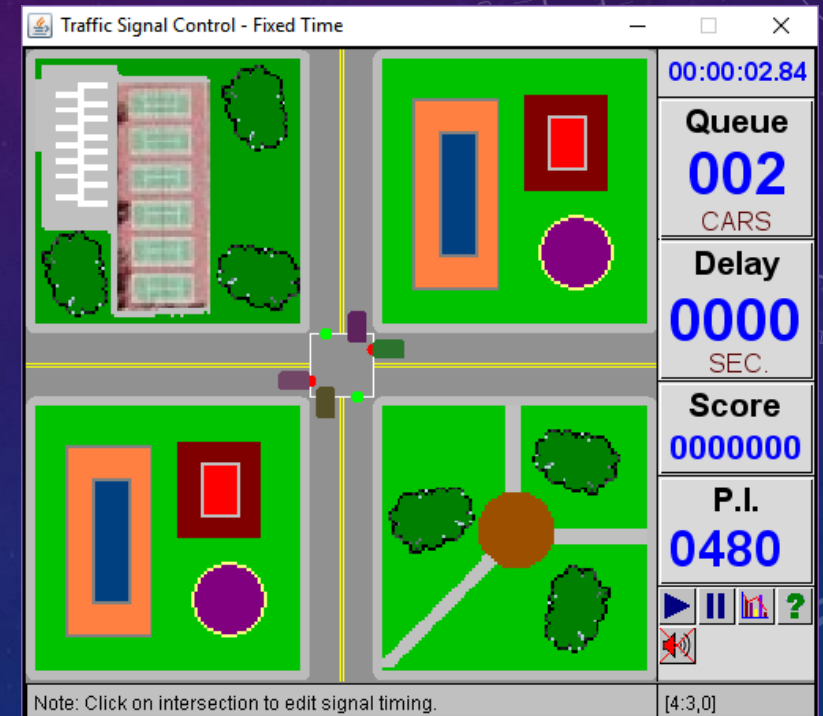

Experiment Procedure: List the variables you will use and the steps you will follow to test your hypothesis:

Observations and Results: Paste and label screen captures of graphs here. Include any observations you make:

Conclusion: Did the experiment confirm your hypothesis? State what you can conclude from the experiment:

- Design your experiment!

1. *Create* a hypothesis
2. *Design* an experiment to test the hypothesis
3. *Perform* the simulation.
4. *Create* whatever graphs you need to confirm or contradict the hypothesis
5. *Form* a conclusion based on your scientific evidence

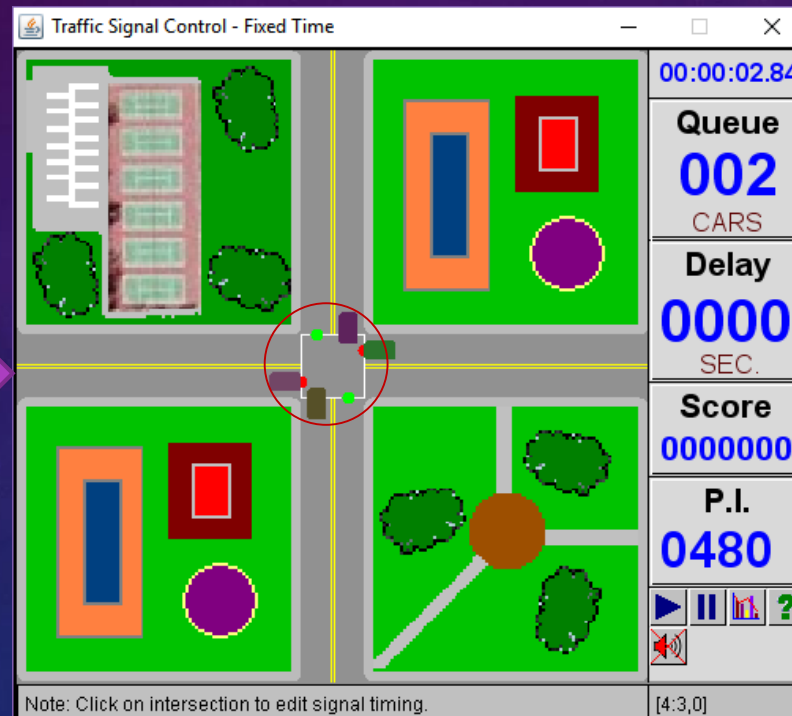

List of Steps to Modify the Fixed Time Parameters:

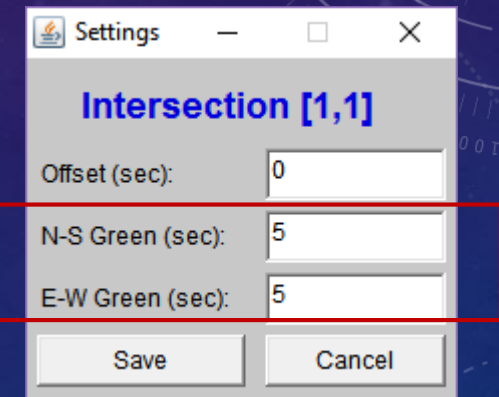

1. Choose Fixed Time Control

2. Pause the game and click on a signal

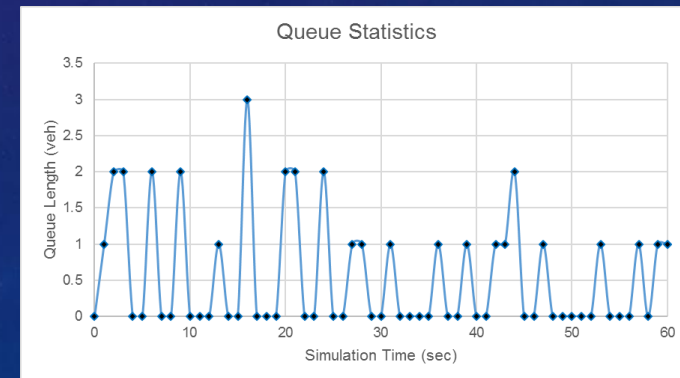

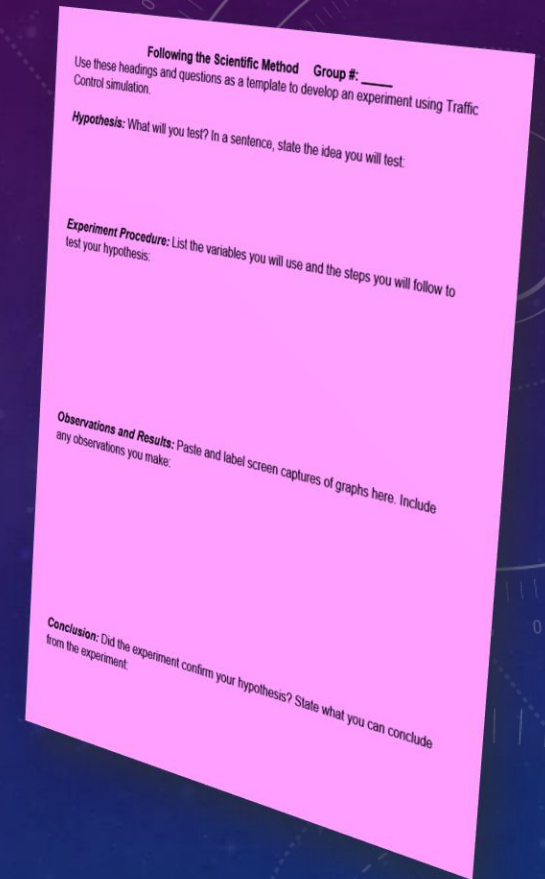

3. Change the signal timing settings

- Design your experiment!

1. *Create* a hypothesis
2. *Design* an experiment to test the hypothesis
3. *Perform* the simulation.
4. *Create* graphs to confirm or contradict the hypothesis
5. *Form* a conclusion based on your scientific evidence

THANKS

A 3D rendering of the word "THANKS" in large, colorful, block letters. Each letter is held by a small, white, stylized character with a rounded body and thin limbs. The characters are positioned behind the letters, appearing to support them. The letters are colored as follows: 'T' is red, 'H' is orange, 'A' is yellow, 'N' is light green, 'K' is dark green, and 'S' is blue. The entire scene is set against a plain white background with a subtle reflection on the surface below.
