ABSTRACT	xxi
GLOSSARY OF TERMS AND ABBREVIATIONS	xxiii
CHAPTER 1 -- INTRODUCTION	1
1.1 Setting	2
1.2 Review of studies of aircraft noise and non-aural health effects	6
1.2.1 Blood Pressure: historical antecedents, definitions	6
1.2.1.1 Brief historical sketch of blood circulation, pulse and blood pressure	6
1.2.2 Meaning and definitions of blood pressure and blood pressure variability	13
1.2.2.1 Blood pressure regulation	13
1.2.2.2 Haemodynamicity/BP variability	20
1.2.2.3 A candidate mechanism from human studies for noise stimulus to affect resting blood pressure	23
1.2.2.4 Issues of measurement of blood pressure	24
1.3 Determinants of child resting blood pressure	32
1.3.1 Activity and fitness levels	32
1.3.2 Diet and eating habits	33
1.3.3 Ambient temperature	33
1.3.4 Childhood conditioning factors	34
1.3.4.1 Age	34
1.3.4.2 Sex	34
1.3.4.3 Race/Ethnicity	34
1.3.4.4 Body mass, height, adiposity and growth stage	35
1.3.4.5 Hormonal/metabolic factors	36
1.3.4.6 'Tracking' of BP levels	36
1.3.4.7 Pulse rate	37
1.3.5 Effect modifiers	37
1.3.5.1 BP and sodium (Na) intake/excretion/sensitivity	37
1.4 Noise	38
1.4.1 Definitions of noise	38
1.4.2 Human perception of, and reaction to, noise	40
1.4.3 Mechanical measurement of noise	41
1.4.3.1 Development of the dB(A) scale	41
1.4.3.2 The Effective Perceived Noise Level (EPNL)	43

1.4.4	What is aircraft noise?	44
1.4.4.1	Social surveys of community reaction to noise	46
1.4.4.2	Event-based noise metrics	50
1.4.4.3	Energy-averaged noise metrics	50
1.4.4.4	Steps in construction of an ANEI (or ANEC or ANEF) value at a given grid point	53
1.5	Noise and health	55
1.5.1	Definitions of health	55
1.5.2	“Stress” and health	56
1.5.2.1	Development of stress as a determinant of health	56
1.5.2.2	Stress and personality type	59
1.5.2.3	Stress and “locus of control”	61
1.5.2.4	Stress, locus of control and personality type	63
1.5.3	Noise as a stressor	64
1.5.3.1	Cardiovascular effects and noise exposure	67
1.6	Aircraft noise and child BP	79
1.6.1	Los Angeles Airport child BP study	79
1.6.2	The Munich Airport Study (1998)	81
1.7	Conclusions	82
CHAPTER 2 -- OBJECTIVES AND METHODS		84
2.0	Introduction	85
2.1	Hypotheses to be tested	85
2.1.1	Implications and interpretation of hypotheses	87
2.2	Study design and its evolution	89
2.2.1	Evolution of the study	89
2.3	Study sample, design effects, approvals, consent, exposure and outcome measurement	92
2.3.1	Response Rates	97
2.3.2	Data Collection	96
2.3.3	Surveys/questionnaires	97
2.3.3.1	Child activity levels	99
2.3.3.2	Child eating before school and use of salt on food	99
2.3.3.3	Child dietary information	99
2.3.3.4	House structure	100
2.3.3.5	Socio-economic status	100
2.3.4	Physical Measurements	101
2.3.4.1	Blood Pressure	102
2.3.4.2	Skinfold thickness	102
2.3.4.3	Height	102
2.3.4.4	Weight	102
2.3.4.5	Ambient Temperature	103

2.3.5 Training and assessment of field workers	103
2.3.6 Ethics clearance and approval mechanisms	104
2.3.7 Reporting of measurements to participants	105
2.3.8 Noise Exposure measurement	105
2.3.9 Geocoding address information and aircraft noise exposure data . . .	107
2.3.10 Non-aircraft noise sources	109
2.4 Statistical Analyses	110
2.4.1 Distributions	111
2.4.2 Regression Models	111
2.4.3 The effect of overflights during blood pressure measurement	117
2.4.3.1 The effect of aircraft overflights on blood pressure measurement	120
2.4.4 Within-subject blood pressure and pulse rate variability	123
2.4.4.1 Conclusions on BP and pulse rate variability	129
2.4.5 Discussion of Methods	131
2.5 Preliminary results	132
2.5.1 Response Rates	132
2.5.2 Blood pressure, weight, height and sub-scapular skinfold distributions	134
2.5.2.1 Baseline	134
2.5.2.2 Follow-up	137
2.5.2.3 Distribution of baseline-to-follow-up BP differences	138
2.5.2.4 Distributions of anthropometric measurements	139
2.5.3 Mean values of physical measurements by sub-group: descriptive statistics of physical factors normally associated with BP	141
2.5.3.1 Baseline	141
2.5.3.2 Follow-up	145
2.5.4 Changes and differences in BP and anthropometric measures between baseline and follow-up samples	148
2.5.4.1 Differences between follow-up and lost-to-follow-up at baseline	148
2.5.4.2 Within-subject changes between baseline and follow-up . .	149
2.5.5 Distributions of school aircraft noise values and children	153
2.6 Summary and conclusions	157
CHAPTER 3 -- RESULTS	160
3.0 Introduction	161
3.1. cross-sectional associations between aircraft noise and blood pressure	161
3.1.1. School aircraft noise exposure -- Pre-baseline, baseline and follow-up	161
3.1.1.1 Systolic blood pressure and school aircraft noise exposure	161

3.1.1.2 Diastolic Blood Pressure and school aircraft noise exposure	166
3.1.2 Total (school + home) aircraft noise exposure, pre-baseline, baseline and follow-up	170
3.1.2.1 Systolic BP and total aircraft noise exposure	170
3.1.2.2 Diastolic BP and total aircraft noise exposure	174
3.1.3 BP and noise measurement artefacts	179
3.1.3.1 BP and aircraft noise exposure as an ordinal variable	179
3.1.3.2 Panel analysis of BP and non-zero aircraft noise exposure	183
3.1.3.3 Summary of unadjusted cross-sectional associations	188
3.2 Regression models of cross-sectional associations between BP and School Aircraft noise exposure -- baseline and follow-up	189
3.2.1 Systolic BP and school aircraft noise exposure	190
3.2.1.1 Baseline systolic BP and pre-baseline noise	190
3.2.1.2 Baseline and follow-up	191
3.2.2. Diastolic BP and school aircraft noise exposure	193
3.2.2.1 Baseline BP and pre-baseline noise	193
3.2.2.2 Baseline and follow-up	193
3.3 Regression models of cross-sectional associations between BP and Total Aircraft noise exposure -- baseline and follow-up	196
3.3.1 Systolic blood pressure and total (home + school) aircraft noise exposure	196
3.3.1.1 Baseline BP and pre-baseline noise	196
3.3.1.2 Baseline and follow-up	196
3.3.2 Diastolic blood pressure and total (home + school) aircraft noise exposure	197
3.3.2.1 Baseline BP and pre-baseline noise	197
3.3.2.2 Baseline and follow-up	197
3.4 Subsidiary BP outcome measures	198
3.4.1 Baseline subsidiary BP measure and pre-baseline noise	198
3.4.2 Baseline subsidiary BP measures and noise	199
3.4.3 Follow-up subsidiary BP measures and noise	199
3.5 Summary of cross-sectional results in relation to hypotheses	199
3.6 Longitudinal associations between aircraft noise and blood pressure	204
3.6.1 Baseline blood pressure and prior changes in aircraft noise exposure	205
3.6.1.1 Recent school aircraft noise exposure change -- pre-baseline to baseline	205
3.6.1.2 Pre-baseline total aircraft noise exposure change and baseline BP	209
3.6.2 Follow-up blood pressure and prior changes in aircraft noise exposure	212
3.6.2.1 Follow-up BP and recent school noise exposure change	212

3.6.2.2 Follow-up BP and recent total noise exposure change	213
3.7 Subsidiary BP outcome measures	215
3.8 Baseline-to-follow-up aircraft noise exposure change and follow-up BP	220
3.8.1 Baseline-to-follow-up school aircraft noise exposure change and follow-up BP	220
3.8.2 Baseline-to-follow-up total aircraft noise change and follow-up BP	222
3.9 Baseline-to-follow-up changes in aircraft noise exposure and corresponding longitudinal changes in BP	227
3.9.1 Changes in school aircraft noise exposure and BP change	227
3.9.2 Changes in total aircraft noise exposure and BP change	229
3.9.3 Summary of longitudinal results	232
3.10 Positive and negative confirmation of hypotheses	234
APPENDIX OF RESULTS	235
CHAPTER 4 -- CONCLUSIONS AND DISCUSSION	296
4.1 Introduction	297
4.2 Summary of findings	297
4.3 Los Angeles and Sydney Airport Studies	299
4.4 The Munich Airport study	304
4.5 Biases and measurement issues in the Sydney study	307
4.5.1 Measurement bias	307
4.5.1.1 Inter-BP measurer (inter-rater) bias	307
4.5.1.2 BP machine bias	308
4.5.1.4 Noise measurement variation, “cross-level” and “regression dilution” bias	308
4.5.2 Selection bias	310
4.6 measures of BP and sources of BP variability	310
4.7 Is there a positive relationship between child BP and aircraft noise exposure?	313
4.8 Implications for further research in the health of populations exposed to domestic jet aircraft noise	313

LIST OF TABLES

Table 1.1 Selection of noise sources in domestic aircraft operation, the mechanism for their generation and areas/people affected (reproduced with modification from [Rodda, 1967]).	45
Table 1.2 Summary of selected studies examining the effects of aircraft noise on mental health.	77
Table 2.1 Events surrounding and following construction of new runway, BP study, and changes in flight operations	106
Table 2.2 Variables used in regression models of blood pressure and aircraft noise.	114
Table 2.3 Proportions of positive differences in successive BP measurements (%), by exposure to aircraft overflights, baseline	121
Table 2.4 Proportions of instances of higher third BP readings than second BP reading (%), in those whose second BP reading did not exceed the first, baseline	122
Table 2.5 Means of blood pressures overall and for main sub-groups, baseline ..	142
Table 2.6 Means of anthropometric variables and pulse rate by major sub-group, baseline	144
Table 2.7 Means of blood pressures overall and for main sub-groups, follow-up ..	145
Table 2.8 Means of anthropometric variables and pulse rate by major sub-group, follow-up	146
Table 2.9 Group proportions, follow-up and lost-to-follow-up, at baseline	148
Table 2.10 Baseline BP, anthropometric and noise exposure differences between follow-up and lost-to-follow-up	149
Table 2.11 Mean within-subject change in blood pressures between baseline and follow-up, overall and for main sub-groups	150
Table 2.12 Mean within-subject change between baseline and follow-up in anthropometric variables and pulse rate by major sub-group, follow-up ..	151
Table 2.13 Participating schools, numbers of children measured, and mean monthly aircraft noise exposure values for month of measurement occasion, baseline and follow-up	153
Table 3.1 Unadjusted regression estimates of BP (mmHg) versus aircraft noise exposure (ANEI units)	188
Table 3.2 Regression estimates of baseline measures of blood pressure versus pre-runway (pre-baseline) school and total aircraft noise exposures	201
Table 3.3 Regression estimates of measures of baseline blood pressure versus baseline school and total aircraft noise exposure	202

Table 3.4	Regression estimates of follow-up measures of BP versus follow-up aircraft noise exposure, school and total	203
Table 3.5	Regression estimates of baseline BP measure versus recent prior (pre-baseline) aircraft noise exposure change, school and total	218
Table 3.6	Regression estimates of follow-up BP measure versus recent prior aircraft noise exposure change, school and total	219
Table 3.7	Regression estimates of follow-up BP measures versus baseline-to-follow-up aircraft noise exposure change, school and total	226
Table 3.8	Regression estimates of baseline-to-follow-up change in BP measure versus follow-up aircraft noise exposure, school and total	233
Table 3.9	Summary of BP variables significantly associated with aircraft noise exposure after adjustment for confounder, effect modifiers, sources of measurement bias and within-subject BP variability	234
Table RA1	Regression estimates of baseline systolic and diastolic blood pressure (mmHg) versus pre-baseline school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	236
Table RA2	Regression estimates of baseline systolic and diastolic blood pressure (mmHg) versus pre-baseline school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, with measures of BP reactivity	237
Table RA3	Regression estimates of systolic blood pressure (mmHg) and school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up	238
Table RA4	Regression estimates of systolic blood pressure (mmHg) and school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, baseline and follow-up	239
Table RA5	Regression estimates of systolic blood pressure (mmHg) versus aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up, school aircraft noise levels ≥ 15 ANEI	240
Table RA6	Regression estimates of systolic blood pressure (mmHg) versus aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and within-subject BP variability, baseline and follow-up, school aircraft noise levels ≥ 15 ANEI	241
Table RA7	Regression estimates of diastolic blood pressure (mmHg) versus school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up.	242
Table RA8	Regression estimates of diastolic blood pressure (mmHg) versus school aircraft noise exposure (ANEI), with confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, baseline and follow-up	243

Table RA9 Regression estimates of diastolic blood pressure (mmHg) versus school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up, school aircraft noise 15 ANEI or above.	244
Table RA10 Regression estimates of diastolic blood pressure (mmHg) versus school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, baseline and follow-up, school aircraft noise 15 ANEI or above.	245
Table RA11 Regression estimates of baseline systolic and diastolic blood pressure (mmHg) versus pre-baseline total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	246
Table RA12 Regression estimates of baseline systolic and diastolic blood pressure (mmHg) versus pre-baseline total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	247
Table RA13 Regression estimates of systolic blood pressure (mmHg) versus total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up	248
Table RA14 Regression estimates of systolic blood pressure (mmHg) versus total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, baseline and follow-up	249
Table RA15 Regression estimates of diastolic blood pressure (mmHg) versus total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, baseline and follow-up	250
Table RA16 Regression estimates of diastolic blood pressure (mmHg) versus total aircraft noise exposure (ANEI),controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP reactivity, baseline and follow-up	251
Table RA17 Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	252
Table RA18 Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	253
Table RA19 Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys	254

Table RA20	Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, girls	255
Table RA21	Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys	256
Table RA22	Regression estimates of baseline systolic and diastolic BP (mmHg) versus prior pre-post runway school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, girls	257
Table RA23	Regression estimates of baseline systolic and diastolic BP (mmHg) versus pre-baseline change in total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	258
Table RA24	Regression estimates of baseline systolic and diastolic BP (mmHg) versus recent change in total baseline aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	259
Table RA25	Regression estimates of baseline systolic and diastolic BP (mmHg) versus pre-baseline change in total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys	260
Table RA26	Regression estimates of baseline systolic and diastolic BP (mmHg) versus pre-baseline change in total aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, girls	261
Table RA27	Regression estimates of baseline systolic and diastolic BP (mmHg) versus recent change in total baseline aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys	262
Table RA28	Regression estimates of baseline systolic and diastolic BP (mmHg) versus recent change in total baseline aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, girls	263
Table RA29	Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	264
Table RA30	Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	265
Table RA31	Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys	266

Table RA32 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, girls	267
Table RA33 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys . . .	268
Table RA34 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus recent change in school aircraft noise exposure (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, girls	269
Table RA35 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers and sources of measurement bias	270
Table RA36 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	271
Table RA37 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers and sources of measurement bias, boys	272
Table RA38 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers and sources of measurement bias, girls	273
Table RA39 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys	274
Table RA40 Regression estimates of follow-up systolic and diastolic BP (mmHg) and recent change in total aircraft noise, controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, girls	275
Table RA41 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	276
Table RA42 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	277
Table RA43 Regression estimates of follow-up systolic BP (mmHg) and baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	278

Table RA44 Regression estimates of follow-up systolic BP (mmHg) and baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	279
Table RA45 Regression estimates of follow-up diastolic BP (mmHg) and baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, and sources of measurement bias, boys & girls	280
Table RA46 Regression estimates of follow-up diastolic BP (mmHg) and baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	281
Table RA47 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias	282
Table RA48 Regression estimates of follow-up systolic and diastolic BP (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability	283
Table RA49 Regression estimates of follow-up systolic BP (mmHg) and baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	284
Table RA50 Regression estimates of follow-up systolic BP (mmHg) and baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	285
Table RA51 Regression estimates of follow-up diastolic BP (mmHg) and baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	286
Table RA52 Regression estimates of follow-up diastolic BP (mmHg) and baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	287
Table RA53 Regression estimates of baseline to follow-up systolic BP change (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	288

Table RA54 Regression estimates of baseline to follow-up systolic BP change (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	289
Table RA55 Regression estimates of baseline to follow-up diastolic BP change (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	290
Table RA56 Regression estimates of baseline to follow-up diastolic BP change (mmHg) versus baseline-to-follow-up school aircraft noise exposure change (ANEI),controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	291
Table RA57 Regression estimates of baseline to follow-up systolic BP change (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	292
Table RA58 Regression estimates of baseline to follow-up systolic BP change (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	293
Table RA59 Regression estimates of baseline to follow-up diastolic BP change (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers and sources of measurement bias, boys & girls	294
Table RA60 Regression estimates of baseline to follow-up diastolic BP change (mmHg) versus baseline-to-follow-up total aircraft noise exposure change (ANEI), controlling for confounding factors, effect modifiers, sources of measurement bias and measures of within-subject BP variability, boys & girls	295

PREFACE

I. NOTE ON THE AUTHOR'S CONTRIBUTION

The Inner Sydney Child Blood Pressure Study was part of a suite of studies commissioned and funded by the Federal Airports Corporation to examine aspects of the health effects of domestic aircraft noise exposure. The role of the author in the Inner Sydney Child Blood Pressure Study was in the design of the study itself, in supervision of child BP data collection, both at baseline and follow-up, and in the processing and statistical and epidemiological analyses of the BP, survey and noise and physical measurement data. The author was also responsible for the design of the survey instrument and the measurement protocols used.

Overall supervision of the project was by a steering committee consisting of members making up the Inner Sydney Child Blood Pressure Study group, including Associate Richard Taylor (School of Public Health, University of Sydney), Dr Norman Carter and Mr Peter Peploe (both of the National Acoustic Laboratories), Dr Soames Job, Department of Psychology, University of Sydney, and the author. Project supervision included liaising with the various school authorities and with the individual school principals in the recruitment of subjects to the study; the training and supervision of fieldworkers; assessment of data quality and its analysis; and the writing of reports for the funding body. Three major and two interim reports were prepared for the funding body relating to this study, co-authored by the study group members. These were:

Morrell S, Taylor R, Carter N, Peploe P, Job RFS (1999). *Draft final report on Phase II of the Inner Sydney Child Blood Pressure Study*. Department of Public Health and Community of Medicine, University of Sydney.

Carter NL, Job RFS, Taylor R, Peploe P, Morrell S (1997). *Sydney Airport Health Studies -- final report on phase I*. Department of Public Health, University of Sydney.

Carter NL, Peter Peploe, Taylor R, Job RFS, Morrell S (1996). *Sydney Airport Health Studies, Interim reports nos 1 & 2*. [Prepared for the Federal Airports Corporation]. Department of Public Health, University of Sydney.

Carter NL, Peploe P, Taylor R, Job RFS, Jenkins A, Morrell S (1993). *Proposal for study of the*

effects of aircraft noise from Sydney (Kingsford Smith) airport on health. [report for Sydney Airport Health Study Committee/Federal Airports Corporation] Department of Public Health, University of Sydney.

Aircraft noise exposure data were collected and processed by Peter Peplow of the National Acoustic Laboratories, both at baseline and follow-up. Geocoding of school and home addresses and aircraft noise exposure data at study baseline was carried out by a research assistant (Layton Walton); geocoding of follow-up addresses and noise data was carried out by the author. The author also supervised a dietary salt study of a baseline subsample, with use of a standard food frequency questionnaire, and co-supervised the subsequent analysis and writing up of these data in 1997, as a treatise by a Master of Public Health candidate in the School of Public Health, University of Sydney.

Parts of the literature review, have been published previously in a peer-reviewed journal and were co-authored by Associate Professor Richard Taylor and Professor David Lyle:

Morrell S, Taylor R, Lyle D (1997). A review of the health effects of aircraft noise. *Australian and New Zealand Journal of Public Health*. 21(2): 221-236.

This publication has been included in Appendix 3.

The remaining work, including the formulation of specific hypotheses for testing within a coherent theoretical paradigm, the interpretation of the results, and the writing up and presentation of this thesis is that of the author.

II. INSTITUTIONAL HUMAN ETHICS COMMITTEE APPROVALS AND CONSENT

Ethics committee approvals were obtained from both the Sydney University Human Ethics Committee and the Central Sydney Area Health Service Ethics Committee to conduct this study. Permission was obtained from the NSW Department of Schools Education and the Catholic Schools Commission to survey and measure primary schoolchildren from schools proximate to the existing and projected flight paths of Sydney airport. Schools unaffected by aircraft noise were also approved for inclusion in the study in order to provide a suitable control comparison group (unexposed to aircraft noise). Permission was sought from each school principal of the individual schools to take part in the study. Also included at this level were independent schools not subject to the central State or Catholic education authorities.

Finally, individual consent was sought from the parents of the children. Consent was active -- that is, only those children whose parents had signed and returned the consent form to the school were measured.

III. ACKNOWLEDGMENTS

First I would like to acknowledge the Federal Airports Corporation (FAC), as it was known at the time, for funding both the baseline and follow-up phases of this study. Thanks in particular are due to Heloise Campbell who was the main liaison person at the FAC.

The most important component of any research project involving empirical measurement of study and outcome factors is the personnel responsible for the collection of the data. In this regard, I unreservedly acknowledge the contributions of the blood pressure measuring teams who comprised:

Baseline BP measurement team: Sara-Jane Bush, Gladys Hitchin, Amelia Howland, Denise Lawson, Yvette Lawson and Patrick Parlow.

Special thanks are due to Patrick Parlow for his efforts in liaising with school principals in ensuring the maximum response to the survey; and to Gladys Hitchin whose eye for detail, persistence and organisational aptitude ensured that the child BP data were collected in an orderly manner and entered into computer format accurately.

Follow-up BP measurement team: Gladys Hitchin, Estella Ortiz, Pam Richardson and Alice Uribe.

Special thanks again are due to Gladys Hitchin who was untiring in her efforts in liaising with school principals, and in collecting and entering the follow-up BP data into computer format. I thank Gladys also for training the follow-up BP measurement team.

I thank Peter Peploe from the National Acoustic Laboratories for his input and expertise in the devising of a system for measuring aircraft noise exposures and converting these raw data into the noise metric used in this study. This was an involved and arduous task requiring a rare and innovative talent and expertise in sound and noise measurement and analysis that has contributed to the cutting-edge rigour of the exposure measures used in this thesis.

I acknowledge the input of Layton Walton who was responsible for geocoding baseline

school and home address information along with baseline noise data into a geographic information system data base which in turn enabled analysis of BP and aircraft noise exposure data.

I thank Dr Norman Carter who headed our study team and provided overall guidance to the project. I thank Norm also for co-supervising this thesis.

I also would like to thank Professor Geoffrey Berry for reading an earlier draft of this thesis to check for statistical and methodological errors.

I especially would like to thank Associate Professor Richard Taylor who is the main supervisor of this thesis and who has been my mentor for the past 12 years. Without Richard's patient, persistent and good-natured encouragement and sharply insightful critiques this thesis would not have appeared.

I also owe thanks for the moral support given freely by my parents, and by work colleagues, especially Dr KC Tang, Dr Milton Lewis and Professor Charles Kerr.

Finally, I would like to thank my wife, Margaret Penman, who has been more persistent than anyone in ensuring that I completed this thesis. She has made sacrifices above and beyond anything that might be called 'spousal duty' and I owe her a debt also beyond 'spousal duty'.

ABSTRACT

The purpose of the study was to examine the existence of an association between child blood pressure (BP) and exposure to domestic jet aircraft noise in the context of the construction of a new parallel north-south runway at Sydney (Kingsford-Smith) Airport. The baseline study was commissioned and funded by the Federal Airports Corporation (FAC), with measurements conducted in 1994 and 1995. A follow-up longitudinal component to the study was subsequently commissioned and funded by the FAC in 1997, and measurements conducted in the same year. As the same individuals were measured and re-measured over changing conditions of exposure to aircraft noise, the quasi-experimental nature of the study allowed inferences to be made regarding exposure to aircraft noise and child BP.

The main hypotheses for testing were that BP, and within-subject longitudinal changes in BP, are positively related to domestic jet aircraft noise exposure and longitudinal changes in domestic jet aircraft noise exposure respectively. Subsidiary hypotheses tested for evidence of short- and long-term BP adaptation effects where BPs were related to prior changes to aircraft noise exposures.

A sample of 75 primary schools within a 20 km radius of Sydney Airport under various noise exposure conditions, both existing and those projected with the advent of the new runway, participated in the study. The baseline cohort comprised 1,230 Year 3/4 children attending the schools in 1994 and 1995, and the follow-up participants comprised 628 of the original baseline sample re-measured in 1997. Study participants were enrolled by active parental consent. The baseline response rate was approximately 40% of children in the participating schools.

Systolic (SBP) and diastolic (DBP) blood pressure readings of the children were taken using automated BP measuring equipment along with anthropometric measurements (heights, weights, skinfold thicknesses and waist measurements). Parental surveys captured items pertaining to the child's ethnic background as measured by the country of birth of the child and parent(s), residential address and housing structure, child eating habits and activity levels, along with family and child history of high blood pressure.

Aircraft noise exposure data were collected by the National Acoustic Laboratories and

processed into the energy-averaged noise metric used in Australia for aircraft noise exposure assessment called the Australian Noise Exposure Index (ANEI). Mean exposures for a given calendar month were used in the analysis. ANEI values were geocoded to exact geographic locations using digitised street maps from which values for each house and school address, also geocoded, were interpolated. A child BP measured in a given month was matched to a aircraft noise exposure value both at their school and residential address for that month for analysis.

After adjusting for confounding and other factors, the cross-sectional relationship between BP and aircraft noise exposure was found to be inconsistent. SBP was non-significantly negatively associated with school aircraft noise exposure at baseline (-0.05 mmHg/ANEI, cluster-sampling-adjusted $p>0.05$), but positively and non-significantly associated with school aircraft noise exposure at follow-up (0.05 mmHg/ANEI, $p>0.05$). As for SBP, baseline DBP was significantly negatively related to school aircraft noise exposure at (-0.09 mmHg/ANEI, $p<0.001$) and non-significantly positively associated with school aircraft noise exposure at follow-up (0.05 mmHg/ANEI, $p>0.05$).

Within-subject BP changes, occurring from baseline to follow-up, regressed on corresponding longitudinal changes in aircraft noise exposures produced inconsistent results. SBP change was positively and non-significantly (0.027 mmHg/ Δ ANEI, $p>0.05$) associated with corresponding school aircraft noise exposure change, while SBP change was negatively associated total aircraft noise exposure change (statistically non-significant, -0.06 mmHg/ Δ ANEI, $p>0.05$). DBP changes were similarly and non-significantly related to corresponding aircraft noise exposure changes.

Some evidence for short-term BP adaptation to recent changes in aircraft noise exposure was found. Consistent negative associations between systolic and diastolic BP and recent changes in school aircraft noise exposure were found. This association was statistically significant at study baseline (SBP: -0.19 mmHg/ Δ ANEI, $p<0.001$; DBP: -0.12 mmHg/ Δ ANEI, $p<0.001$), and of similar magnitude although not statistically significant at follow-up (SBP: -0.14 mmHg/ Δ ANEI; DBP: -0.10 mmHg/ Δ ANEI, $p>0.05$). In the presence of inconsistent cross-sectional BP-aircraft noise exposure associations, this finding is consistent with evidence of a homeostatic BP response to recent changes in aircraft noise exposure, where resting BP returns to pre-existing levels unrelated to aircraft noise exposure. The public health implication of this finding appears to be benign.

GLOSSARY OF TERMS AND ABBREVIATIONS

AAMI	American Association for Advancement of Medical Instrumentation
ACTH	Adrenocorticotrophic Hormone
ADH	Antidiuretic Hormone
AMP	Adenosine Monophosphate
ANEC	Australian Noise Exposure Concept
ANEF	Australian Noise Exposure Forecast
ANEI	Australian Noise Exposure Index
AV	Atrioventricular
BCE	Before the Current Era (a secular version of Before Christ)
BMI	Body Mass Index
BP	Blood Pressure
CAD	Coronary Artery Disease
CHD	Coronary Heart Disease
CVD	Cardiovascular Disease
dB	Decibel
dB(A/B/C)	A, B or C-weighted decibel
DBP	Diastolic Blood Pressure
EIS	Environmental Impact Study
EPNdB	Effective Perceived Noise Decibel
EPNL	Effective Perceived Noise Level
ESB	English Speaking Background
GAS	General Adaptation Syndrome
GHQ	General Health Questionnaire
INM	Integrated Noise Model
K4/5	4th/5th Korotkov phase
Ldn	Average sound level with day/night weighting
LAeq	Equivalent continuous sound pressure level, A-weighted
MAP	Mean Arterial Pressure
MPP	Multi-centre Postinfarction Program
MRFIT	Multi Risk Factor Intervention Trial
N70	Mean hourly number of noise events exceeding 70 dB(A)
NEF	Noise Exposure Forecast
NESB	Non-English Speaking Background

NIMBY	Not In My Back Yard
N.I.	Noise Number Index
PNdB	Perceived Noise Decibel
PNL	Perceived Noise Level
RSNA	Renal Sympathetic Nerve Activity
SA	Sinoatrial
SBP	Systolic Blood Pressure
SES	Socio-economic Status
SEL	Sound Exposure Level
SPL	Sound Pressure Level
WCGS	Western Collaborative Group Study
WCH	White-coat Hypertension
