## **STATEMENT OF ORIGINALITY**

I hereby declare that this submission is my own work and to the best of my knowledge it contains no materials previously published or written by another person, nor material which to a substantial extent has been accepted for the award of any other degree or diploma at the University of Sydney or any other educational institution, except where due acknowledgment is made in the thesis. Any contribution made to the research by others, with whom I have worked at the University of Sydney or elsewhere, is explicitly acknowledged in the thesis.

I also declare that the intellectual content of this thesis is the product of my own work, except to the extent that assistance from others in the project's design and conception or in style, presentation and linguistic expression is acknowledged.

## ACKNOWLEDGEMENTS

First, I wish to thank my supervisor, Professor Des R Richardson, for the opportunity he offered me to undertake my PhD project in the Iron Metabolism and Chelation Program. I am very grateful for his care and endless encouragement, expert guidance and for providing me with an enthusiastic and critical atmosphere for this exciting project. I would also like to give my sincere gratitude to Des for his support in the preparation of manuscripts and for the opportunity to present my work at local and international conferences.

Thanks to my co-supervisor, Dr. Eric O. Sekyere, for sharing his time in this study, his knowledge on molecular techniques and the creation of the MTf knockout mouse. Thank you as well for his assistance with the transgenic MTf hyper-expression model. I must also acknowledge my colleague, Miss Louise Dunn, for sharing the “Ph.D. experience”. I would also like to acknowledge the help and expertise that Louise provided in the various animal and molecular techniques/methods used in this study, particularly: (i) for the help in characterising the MTf knockout mouse and (ii) the development and phenotypic characterisation of siRNA-mediated MTf down-regulation in SK-Mel-28 and SK-Mel-2 cell line models.

Special thanks also go to fellow Ph.D. candidates in the Iron Metabolism and Chelation Program, Miss Danuta S. Kalinowski and Mr. Xiangcong Xu, for their friendship and encouragement. I also acknowledge all the other members at Iron Metabolism and Chelation Program whom I interacted with, especially Dr. David Lovejoy, Dr. Dong Fu,

---

Dr. Jonathan Howard, Dr. Ralph Watts, Miss Rosemary Siafakas and Miss Megan L. Whitnall for the advice and help during my candidature.

The following people's expertise assisted in the characterisation of the *MTf* knockout mouse, namely: Veterinarian Dr. Susan Maastricht, Veterinary Pathologists Dr. Terry Rothwell and Dr. JoAnn Schuh, and the wonderful technical staff of the Faculty of Veterinary Science at the University of Sydney. This includes: David Griffin, George Tsoulakis and Elaine Chew. Dr. Mervyn Thomas and Kelly Fleetwood (Emphron Informatics) are thanked for their assistance with statistical analysis of the gene array. Mrs. Rabeya Akter (University of New South Wales) is kindly acknowledged for the measurement of Fe, Cu and Zn levels using Inductively Coupled Plasma - Atomic Emission Spectroscopy (ICP-AES). Dr. Frank Koentgen and Mr. Eric Hardy from Ozgene Pty. Ltd. are thanked for the help and development of both *MTf* knockout and transgenic hyper-expression models.

I would like to acknowledge the Department of Pathology and its entire staff for a wonderful environment to work and it has really been a joy to spend time with them. I would like to acknowledge funding from the NHMRC for Project Grant support. I also thank the University of Sydney and Children's Cancer Institute Australia for the Australian Postgraduate Award scholarship and financial assistance.

I am very grateful for my girlfriend, Yu Yu, for her patience, kindness and emotional and loving support during the last year of my Ph.D. studies.

---

Finally, and most importantly, to my family: Dad (Suryo Yusuf), Mum (Renny Rahmanto) and brothers (Aldwin and Bryan), I really couldn't have done this without your endless vision, encouragement, emotional and loving support and your willingness to be there whenever I have needed you.

---

## ABSTRACT

Melanotransferrin or melanoma tumour antigen p97 (MTf) is a transferrin homologue that is found predominantly bound to the cell membrane *via* a glycosyl phosphatidylinositol anchor. The molecule is a member of the transferrin super-family that binds iron through a single high affinity iron(III)-binding site. Melanotransferrin was originally identified at high levels in melanoma cells and other tumours, but at lower levels in normal tissues. Since its discovery, the function of MTf has remained intriguing, particularly regarding its role in cancer cell iron transport. In fact, considering the crucial role of iron in many metabolic pathways *e.g.*, DNA and haem synthesis, it is important to understand the function of melanotransferrin in the transport of this vital nutrient. Melanotransferrin has also been implicated in diverse physiological processes, such as plasminogen activation, angiogenesis, cell migration and eosinophil differentiation. Despite these previous findings, the exact biological and molecular function(s) of MTf remain elusive. Therefore, it was important to investigate the function of this molecule in order to clarify its role in biology.

To define the roles of MTf, six models were developed during this investigation. These included: the first MTf knockout ( $MTf^{-/-}$ ) mouse; down-regulation of MTf expression by post-transcriptional gene silencing (PTGS) in SK-Mel-28 and SK-Mel-2 melanoma cells; hyper-expression of MTf expression in SK-N-MC neuroepithelioma cells and LMTK<sup>-</sup> fibroblasts cells; and a MTf transgenic mouse ( $MTf^{Tg}$ ) with MTf hyper-expression.

---

The *MTf*<sup>-/-</sup> mouse was generated through targeted disruption of the *MTf* gene. These animals were viable, fertile and developed normally, with no morphological or histological abnormalities. Assessment of Fe indices, tissue Fe levels, haematology and serum chemistry parameters demonstrated no differences between *MTf*<sup>-/-</sup> and wild-type (*MTf*<sup>+/+</sup>) littermates, suggesting MTf was not essential for Fe metabolism. However, microarray analysis showed differential expression of molecules involved in proliferation such as *myocyte enhancer factor 2a* (*Mef2a*), *transcription factor 4* (*Tcf4*), *glutaminase* (*Gls*) and *apolipoprotein d* (*Apod*) in *MTf*<sup>-/-</sup> mice compared with *MTf*<sup>+/+</sup> littermates.

Considering the role of MTf in melanoma cells, PTGS was used to down-regulate *MTf* mRNA and protein levels by >90% and >80%, respectively. This resulted in inhibition of cellular proliferation and migration. As found in *MTf*<sup>-/-</sup> mice, melanoma cells with suppressed MTf expression demonstrated up-regulation of *MEF2A* and *TCF4* in comparison with parental cells. Furthermore, injection of melanoma cells with decreased MTf expression into nude mice resulted in a marked reduction of tumour initiation and growth. This strongly suggested a role for MTf in proliferation and tumourigenesis.

To further understand the function of MTf, a whole-genome microarray analysis was utilised to examine the gene expression profile of five models of modulated MTf expression. These included two stably transfected MTf hyper-expression models (*i.e.*, SK-N-MC neuroepithelioma and LMTK<sup>-</sup> fibroblasts) and one cell type with down-regulated MTf expression (*i.e.*, SK-Mel-28 melanoma). These findings were then

---

---

compared with alterations in gene expression identified using the *MTf*<sup>-/-</sup> mouse. In addition, the changes identified from the microarray data were also assessed in another model of MTf down-regulation in SK-Mel-2 melanoma cells. In the cell line models, MTf hyper-expression led to increased proliferation, while MTf down-regulation resulted in decreased proliferation. Across all five models of MTf down- and up-regulation, three genes were identified as commonly modulated by MTf. These included *ATP-binding cassette sub-family B member 5* (*Abcb5*), whose change in expression mirrored MTf down- or up-regulation. In addition, *thiamine triphosphatase* (*Thtpa*) and *Tcf4* were inversely expressed relative to MTf levels across all five models. The products of these three genes are involved in membrane transport, thiamine phosphorylation and proliferation/survival, respectively. Hence, this study identifies novel molecular targets directly or indirectly regulated by MTf and the potential pathways involved in its function, including modulation of proliferation.

To further understand the function of MTf, transgenic mice bearing the *MTf* gene under the control of the human *ubiquitin-c* promoter were generated and characterised. In *MTf*<sup>Tg</sup> mice, *MTf* mRNA and protein levels were hyper-expressed in a variety of tissues compared with control mice. Similar to the *MTf*<sup>-/-</sup> mice, these animals exhibited no gross morphological, histological, nor Fe status changes when compared with wild-type littermates. The *MTf*<sup>Tg</sup> mice were also born in accordance with classical Mendelian ratios. However, haematological data suggested that hyper-expression of MTf leads to a mild, but significant decrease in erythrocyte count.

---

In conclusion, the investigations described within this thesis clearly demonstrate no essential role for MTf in Fe metabolism both *in vitro* and *in vivo*. In addition, this study generates novel *in vitro* and *in vivo* models for further investigating MTf function. Significantly, the work presented has identified novel role(s) for MTf in cell proliferation, migration and melanoma tumourigenesis.

## LIST OF FIGURES

|  |    |
|--|----|
| Figure 1.1. The phylogenetic tree of MTfs and the other Tf family members. ....  | 8  |
| Figure 1.2. BLAT analysis arising from the human <i>MTf</i> ( <i>hMTf</i> ) and mouse <i>MTf</i> ( <i>mMTf</i> ) genes.....  | 10 |
| Figure 1.3. Amino acid sequence and other motifs in human MTf. ....  | 17 |
| Figure 1.4. Mouse mRNA (poly A+) Master Blot <sup>TM</sup> sequentially hybridised to mouse melanotransferrin (mMTf) cDNA, mouse transferrin receptor 1 (TfR1) cDNA and hypoxanthine guanine phosphoribosyl transferase (HGPT) cDNA (loading control). ..... | 20 |
| Figure 1.5. Immunohistochemistry using anti-hMTf MoAb L235 compared with a relevant control without the antibody demonstrating the distribution of hMTf in: (A) skin, (B) liver, (C) kidney and (D) salivary gland. ....                                     | 21 |
| Figure 1.6. Overview of the postulated role of MTf in plasminogen activation and angiogenesis.....   | 30 |
| Figure 3.1. Targeted disruption of the mouse melanotransferrin ( <i>mMTf</i> ) gene.....   | 68 |
| Figure 3.2. Confirmation of mMTf ablation in the mouse at the genomic DNA, mRNA and protein levels. ....   | 69 |
| Figure 3.3. Examination of growth rates, organ to body weight ratios and brain Fe levels of <i>MTf</i> <sup>-/-</sup> compared with <i>MTf</i> <sup>+/+</sup> littermates.....   | 72 |
| Figure 3.4. Comparative data analysis and RT-PCR of genes showing differential expression between <i>MTf</i> <sup>-/-</sup> and <i>MTf</i> <sup>+/+</sup> mice. ....   | 86 |
| Figure 3.5. Post-transcriptional gene silencing (PTGS) of MTf in melanoma cells leads to decreased <i>MTf</i> mRNA and protein levels. ....  | 88 |

---

|  |     |
|--|-----|
| Figure 3.6. Post-transcriptional gene silencing (PTGS) of MTf in melanoma cells leads to a significant decrease in cellular proliferation and DNA synthesis..... | 91  |
| Figure 3.7. Addition of Fe, soluble apo-MTf or soluble holo-MTf does not rescue decreased melanoma cell proliferation induced by MTf down-regulation.            | 93  |
| Figure 3.8. Down-regulation of MTf expression reduces SK-Mel-28 melanoma cell migration <i>in vitro</i> .  | 96  |
| Figure 3.9. Down-regulation of MTf expression decreases tumour growth <i>in vivo</i> .   | 98  |
| Figure 4.1. The effect of MTf down-regulation or hyper-expression on proliferation across a variety of cell lines.   | 120 |
| Figure 4.2. The effect of MTf expression on cellular proliferation.  | 121 |
| Figure 4.3. Biological processes associated with differentially expressed genes.   | 125 |
| Figure 4.4. Specific biological processes associated with down- and up-regulated genes.  | 126 |
| Figure 4.5. RT-PCR analysis of genes showing differential expression across four different MTf models assessed using Affymetrix GeneChips <sup>®</sup> .         | 129 |
| Figure 4.6. Comparative data analysis of genes showing differential expression between MTf down-regulation/ablation and hyper-expression compared with controls. | 132 |
| Figure 5.1. Schematic diagram and verification of the <i>melanotransferrin (MTf)</i> lentiviral transgene.   | 152 |
| Figure 5.2. MTf hyper-expression in the mouse at the mRNA and protein levels.  | 155 |
| Figure 5.3. Post-natal growth rate and relative organ weights of the <i>MTf<sup>Tg</sup></i> and <i>MTf<sup>WT</sup></i> mice.                                   | 160 |

---

---

Figure 6.1. The MTf knockout mouse and gene array studies indicate that MTf has no  
essential role in iron metabolism, but could be necessary for cellular growth  
and proliferation ..... 173

---

## LIST OF TABLES

|   |    |
|---|----|
| Table 1.1. Comparison of known MTf gene and protein sequences between species.....  | 6  |
| Table 1.2. Comparison of the Fe- and anion-coordinating amino acids present in MTfs<br>and other Tf homologues .....  | 15 |
| Table 2.1. Chemicals and general reagents.....  | 39 |
| Table 2.2. Cell culture reagents .....  | 41 |
| Table 2.3. Buffers and solutions .....  | 42 |
| Table 3.1. Primers for amplification of mouse and human mRNA.....   | 64 |
| Table 3.2. Haematological indices in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup><br>littermates at 12 weeks of age.....  | 75 |
| Table 3.3. Selected serum chemistry indices in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup><br>littermates at 12 weeks of age.....                                      | 76 |
| Table 3.4. Differential cell counts in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup><br>littermates at 12 weeks of age.....  | 77 |
| Table 3.5. Serum Fe indices in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup> littermates at<br>12 weeks of age.....  | 79 |
| Table 3.6. Tissue Fe stores in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup> littermates at 12<br>weeks of age.....  | 79 |
| Table 3.7. Tissue copper (Cu) stores in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup><br>littermates at 12 weeks of age.....   | 80 |
| Table 3.8. Tissue zinc (Zn) stores in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup><br>littermates at 12 weeks of age.....   | 80 |
| Table 3.9. Tissue-Fe stores in <i>MTf</i> <sup>-/-</sup> mice compared with their <i>MTf</i> <sup>+/+</sup> littermates at 12<br>weeks of age on basal-Fe (0.02% w/w) and high-Fe (2.00% w/w) diets.... | 82 |

---

---

|   |     |
|---|-----|
| Table 3.10. The 30 genes showing the most significant differential expression between <i>MTf</i> <sup>-/-</sup> and <i>MTf</i> <sup>+/+</sup> genotypes.....                                  | 84  |
| Table 4.1. Primers for amplification of mouse and human mRNA .....  | 112 |
| Table 4.2. Summary of differential gene expression across all models assessed using Affymetrix GeneChips <sup>®</sup> .....   | 115 |
| Table 5.1. Primers for genotyping and amplification of mouse mRNA.....  | 148 |
| Table 5.2. Offspring from multiple matings <sup>§</sup> .....   | 157 |
| Table 5.3. Differential blood count and haematological indices in <i>MTf</i> <sup>Tg</sup> mice compared with their <i>MTf</i> <sup>WT</sup> littermates at 8 weeks of age <sup>§</sup> ..... | 162 |
| Table 5.4. Serum clinical chemistry indices in <i>MTf</i> <sup>Tg</sup> mice compared with their <i>MTf</i> <sup>WT</sup> littermates at 8 weeks of age <sup>§</sup> .....                    | 163 |
| Table 5.5. Selected metal stores in the organs of <i>MTf</i> <sup>Tg</sup> mice compared with their <i>MTf</i> <sup>WT</sup> littermates at 8 weeks of age <sup>§</sup> .....                 | 165 |
| Table 6.1. Summary of the functional roles of genes affected by modulation of melanotransferrin gene expression.....  | 187 |
