In the crystal structure of dihydroxydiphthalatotricobalt(II), $\left[\mathrm{Co}_{3}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)_{2}(\mathrm{OH})_{2}\right]_{n}$, two of the four independent Co atoms lie at special positions of site symmetry 2 . The hydroxy groups link three Co atoms to form a pyramidal $\mathrm{Co}_{3} \mathrm{O}$ unit, and adjacent $\mathrm{Co}_{3} \mathrm{O}$ units are linked through the Co base atoms into a honeycomb layer motif. Each of the phthalate dianions uses the O atoms of one carboxyl group to bind to three Co atoms, the bonding mode giving rise to six-coordinate Co atoms.

## Comment

Hydrothermally synthesized cobalt(II) derivatives of benzene polycarboxylic acids exist as hydroxides. The tetracarboxylate compound adopts a framework architecture that constitutes roughly only half the volume of the unit cell (Gutschke et al., 2001a). Cobalt hydroxide benzene-1,4-dicarboxylate, on the other hand, packs in such a manner that the $\pi$ systems of adjacent carboxylate anions interact magnetically (Huang et al., 2000). Other than a tricarboxylate derivative (Gutschke et al., 2001b), there are no further reports to date of such cobalt hydroxide derivatives of benzene polycarboxylic acids.

Unlike the reaction of cobalt(II) carbonate with phthalic acid in water, which affords hexaaquacobalt hydrogen phthalate (Kariuki \& Jones, 1993), the reaction of cobalt(II) nitrate and potassium hydrogen phthalate under hydrothermal conditions yielded the title cobalt(II) hydroxide derivative, ( I ), and its structure is presented here.

The crystal structure of (I) is built up of a layer motif consisting of corner-sharing pyramidal $\mathrm{Co}_{3} \mathrm{O}$ units. These units are linked through the Co corners to form a hexagonal unit, which also shares its Co corners, giving rise to a honeycomb motif (Fig. 1). The layers that make up the structure feature a $\mathrm{Co}_{3} \mathrm{O}$ core, and the aromatic groups protrude from the top and bottom of each layer. Where the layers come together,
aromatic-aromatic edge-face interactions exist. The $\mathrm{Co}_{3} \mathrm{O}$ unit is also documented in the other compounds mentioned above. For example, in the terephthalate derivative $\left[\mathrm{Co}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)(\mathrm{OH})_{2}\right.$ ], the $\mathrm{Co}_{3} \mathrm{O}$ units form layer structures by edge- and corner-sharing (Huang et al., 2000). This layer motif is not adopted by the tri- and tetracarboxylates.

(I)

The four independent Co atoms in (I) exist in an octahedral environment (Fig. 2), and each is coordinated by four O atoms from carboxyl groups and two O atoms from hydroxyl groups.

Figure 1
A view of the layer structure of (I), illustrating the honeycomb motif built from $\mathrm{Co}_{3} \mathrm{O}$ pyramids.

Each hydroxyl group bridges three Co atoms. For both independent phthalate dianions, each carboxyl $-\mathrm{CO}_{2}$ group is linked to three Co atoms.

## Experimental

Cobalt(II) nitrate hexahydrate $(0.17 \mathrm{~g}, 0.6 \mathrm{mmol})$ and potassium hydrogen phthalate $(0.37 \mathrm{~g}, 1.8 \mathrm{mmol})$ were dissolved in water $(15 \mathrm{ml})$. The solution was placed in a Teflon-lined stainless-steel vessel, which was then heated to 473 K for 60 h . The vessel was then allowed to cool to room temperature and needle-shaped crystals of

Figure 2

Symmetry codes: (i) $\frac{1}{2}-x, \frac{1}{2}-y, z$; (ii) $x, \frac{1}{2}-y, z-\frac{1}{2}$; (iii) $\frac{3}{2}-x, y, z-\frac{1}{2}$; (iv) $\frac{3}{2}-x, \frac{1}{2}-y, z$; (v) $x, \frac{1}{2}-y, \frac{1}{2}+z$; (vi) $\frac{1}{2}-x, y, \frac{1}{2}+z$.

The aromatic and hydroxyl H atoms were generated geometrically $(\mathrm{C}-\mathrm{H}=0.93 \AA$ and $\mathrm{O}-\mathrm{H}=0.98 \AA)$ and were allowed to ride on
their parent atoms in riding-model approximations, with $U_{\text {iso }}(\mathrm{H})$ values set at $1.2 U_{\text {eq }}$ (parent). The final difference map had peaks of more than $1 \mathrm{e} \AA^{-3}$ near the four Co atoms.
