A Study of iPhone's Attractiveness Factors By the Miryoku Engineering Approach

Chi-Hung Lo, Geng-You Liao, Zi-Xian Tang, Xin-Wei Chen, Hong-Fu Xu, Jing Hu, and Linda

Department of Industrial Design, Tunghai University

Abstract

Since the first iPhone was launched by Apple Inc., more than a decade ago, the iPhone products have remained the attractiveness for consumers in the worldwide market. Except for its unique brand image, excellent marketing strategy, and successful cost control, the superior design of iPhone has been the main contributing factor to its success. The objective of this study is to investigate the attractiveness factors of iPhone. The investigation starts from the product appearance and functions of iPhone. The target products include a range of iPhone products from iPhone 4 to the latest iPhone X, which are analyzed by the evaluation grid method of Miryoku engineering approach and the quantification theory type I. The results indicated that iPhone's abstract features can generally be classified by the evaluation grid method into (1) Adjectives for appearance: stylish, consistent, high-quality, comfortable, succinct, and proportionally adequate; (2) Adjectives for function: safe, convenient, efficient, and ergonomic. The analysis by the quantification theory type indicated that the male and female preferences are different as follows. For product profile, males pay attention to smooth surface but females prefer matte textures. For product features, males highlight fingerprint recognition but females emphasize more on voice assistant. Design differentiation for different target groups of users is recommended for future smartphones. Follow-up researchers are also advised to carry out investigations on potential users' gender and experiences of using smartphones of other brands.

 OPEN ACCESS

1. Introduction

Since the first iPhone was announced by Steve Jobs in 2007, the percentage of smartphones has been increasing to 63% according to the research by Zenith Marketing Group Inc. By the end of 2017, the total number of smartphones that have been sold reach 1.2B according to the investigation by Statista Research & Analysis. When iPhone X was launched in 2017Q4, the market share of iPhones accounts for 51%, which

indicates iPhone's high level of attractiveness for consumers. In addition to brand image, marketing strategy, integration of hardware and software, and cost control, the appearance and features of iPhone products definitely have presented attractiveness to consumers so that a large number of people are willing to buy iPhones. Most of the earlier studies of iPhone concentrated around topics such as brand image, brand loyalty, and willingness to buy. On the contrary, few researchers carried out studies of iPhone's attractiveness factors. The objective of this study is to determine the attractiveness factors of iPhone by the evaluation grid method of Miryoku engineering approach. A questionnaire survey is carried out so that the attractiveness factors can be determined by the quantification theory type I. The results serve as a good reference for smartphone vendors and follow-up researchers on smartphone designs.

2. Literature Review

Apple Inc. has been building its brand image in order to guide consumers into buying Apple products (Weng, 2016). It utilizes the influence by media to compete with other smartphone vendors on the market (Tan, 2008). It also built various types of online platforms via the integration of hardware and software (Wu, 2014). It realizes the maximum profits by strict cost controls (Wu, 2014). However, the credit should also go to the excellent designs of iPhone products. The attractiveness of iPhone is effectively enhanced by the style design, color scheme, material selection, surface treatment or various types of functional innovations.

The Miryoku engineering approach is a branch of Kansei engineering. It was proposed by M. Ujigawa in 1991 and it deals with the techniques and knowledge for creating products or spaces that are attractive. Earlier studies clearly indicated that a product can be profoundly loved by consumers if a designer can master the consumers' desire for aesthetics on product appearance during the product design and development process (Huang, 2000). The study by Huang (2006) determined the attractiveness factors of consumer electronics on six attributes which include shape, color, material, imagery, functions, and decoration based on the evaluation grid method of Miryoku engineering. His study proposed a total of 8 attractiveness factors which are respectively (1) Convenient design, (2) Fashionable design, (3) Simple design, (4) Friendly design, (5) Imaginary design, (6) Quality texture, (7) Special design, and (8) Generating curiosity. The study of the attractiveness factors of professional LED flashlights by Ni (2012) indicated 5 top factors of attractiveness features including (1) Professional, (2) Safe, (3) Stylish, (4) Convenient, and (5) Convenient.

3. Methods

A series of iPhone products including iPhone 4 to the latest iPhone X are selected for investigation in this study. A total of 11 experts are interviewed by using the evaluation grid method in order to determine the attractiveness factors of iPhone. After that, a questionnaire survey was carried out by the quantification theory type I in order to determine which attractiveness factors are more influential than others. The research framework is shown in Figure 1.

Before interviewing with experts, photos of iPhone products are prepared and classified as follows. (1) Appearance: Phones of the styles and color-matching schemes of iPhones between iPhone 4 and iPhone X are collected. (2) Internal features: Photos including iOS system, Apple Store, fingerprint recognition system, and Face ID are collected. (3) Others: Photos of former Apple CEO Steve Jobs, after care service, and accessories are also collected. The total number of photos is 30 and they are shown in Figure 2.

These 11 experts for interview have to meet three requirements as follows. (1) More than 2 years of iPhone experience. (2) Experience with more than two iPhone models. (3) Own other Apple accessories. The interviews are carried out from Oct. 24th, 2017 to Nov. 7th, 2017. The abstract characteristics and concrete characteristics that are described by the experts are recorded in order to construct the evaluation grid diagram for iPhone. The factors with the mode values are classified into two groups which are respectively appearance and feature for the design of the questionnaire.

The questionnaire is designed with two portions of questions as follows. (1) Background information: Gender, age, years of iPhone experience, and experience with other smartphone brands. (2) Attractiveness evaluation: Two questions for evaluating the weights of abstract characteristics for appearance and feature. 10 questions of selecting the concrete characteristics that correspond to abstract characteristics. The questionnaire copies were dispatched during the period between Dec. 26th, 2017 and Jan. 2nd, 2018. The total number of questionnaire copies is 154. The number of valid questionnaire copies that are returned is 122.

After excluding those 32 copies of invalid questionnaire, the analysis by the quantification theory type I is carried out by all, gender, age, years of iPhone experience, and experience with other smartphone brands.

The evaluation grid diagram of iPhone's attractiveness factors is shown in Figure 3, in which orange items stand for abstract characteristics (top), red items original evaluation items (middle), and green concrete characteristics (bottom).

**Figure** 1: Research framework of this study.

Based on the results in Figure 3, the mode values are shown in Figure 4, in which the items to the right are abstract characteristics and those to the left are the corresponding concrete characteristics. It was found in Figure 4 that these abstract characteristics can be classified into two group which are adjectives for appearance or feature respectively.
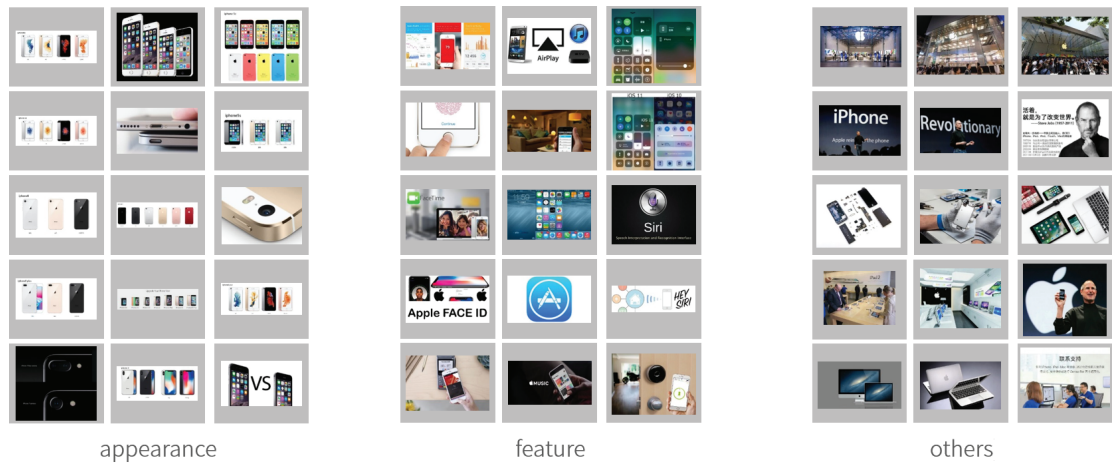

appearance   feature   others

Figure 2: Photos that are selected for the evaluation grid method.

4. Results and Discussion

The background information of the participants is as shown in Table 1.

TABLE 1: Background information of participants.

Gender	Males:41%(50) Females:59%(72)	Smartphone brands	Android:83% (101) WindowPhone:0% (0) Other:5%(6) No experience with other brands:12% (15)
Age	18 yrs old or below: 0%(0)	Years of experience	1 yr or below: 24%(33)
	18 25yrs old: 71%(86)		2yrs: 20%(24)
	26 30yrs old: 23%(28)		3yrs: 20%(26)
	31 40yrs old: 2%(3)		4yrs: 11%(13)
	41 50yrs old: 2%(2)		5yrs: 7%(11)
	51 60yrs old: 2%(3)		6yrs: 9%(11)
	60 yrs old or above: 0%(0)		7yrs: 4%(5)
			8yrs: 3%(4)
			9yrs: 0%(0)
			10yrs: 2%(2)
A total of 122 questionnaire copies are returned with a return rate of 100%			(): Number of participants

The results of the general analysis by the quantification theory type I is shown in Table 2 as follows.

The results of the analysis by the quantification theory type I by gender is shown in Table 3 as follows.
Figure 3: Evaluation grid diagram of iPhone's attractiveness factors.

The next step is to analyze by the years of experience with iPhone. Since the number of participants with more than 5 years of iPhone experience is insufficient as samples for investigation, only the results of participants with less than 5 years of iPhone experience are shown in Table 4 as follows.

Abstract concept

appearance

設計感 (Design) 7	：包含造型、顏色、材質與表面處理等設計要素。
一致感 (Consistency) 4	：歷代iPhone與APPLE的其他商品皆具有相同的設計元素。
質感的 (Good texture) 4	：有著良好的手感與品質。
舒服的 (Comfortable) 4	：造型和諧。
簡潔的 (Simple) 4	：造型簡潔俐落。
比例適當 (Suitable size) 4	：手機機身大小適當。

feature

安全性 (Safety) 6	：有效保護使用者的隱私、避免他人竊取使用。
方便性 (Convenience) 6	：軟硬體設備使得使用者便於操作。
效能好 (High efficiency) 4	：系統、相機等軟硬體設備效能好。
符合人性 (Human nature) 5	：符合人們的使用直覺。

TABLE 2: General analysis by the quantification theory type I.

		Ranking #1	Ranking #2	Ranking #3	Partial coefficient of correlation
Adjectives for appearance	Stylish	Stylish lens design	Aesthetic style design	-	0.343
	Consistent	Matte texture	Attention to details	Simple and brief shape	0.421
	High-quality	Stylish lens design	Matte texture	Simple and brief shape	0.411
	Comfortable	Matte texture	Color	Smooth phone surface	0.278
	Succinct	Smooth phone surface	Color	Matte texture	0.425
	Proportionally adequate	Ergonomically fit	-	-	0.183
Adjectives for feature	Sate	Automatic bug-fixing	Fingerprint recognition	-	0.181
	Convenient	Fingerprint recognition	Voice assistant	No more wallet	0.289
	Efficient	Stable operating system	-	-	0.182
	Ergonomic	Feedback during operations	Exchanging opinions	Voice assistant	0.269

For the analysis of participants with experience of using other brands, since the number of samples is insufficient for participants with Windows Phone, other brands or no experience, only the result of participants with Android smartphone experience is shown in Table 5 as follows.

5. Conclusion

Results of this study indicated that the abstract features can generally be classified by the evaluation grid method into (1) Adjectives for appearance: stylish, consistent, high-quality, comfortable, succinct, and proportionally adequate; (2) Adjectives for function: safe, convenient, efficient, and ergonomic.

The results of the questionnaire survey on the participants by the quantification theory type I indicated that the correlation is insignificant. Moreover, no control group for the factors including the number of years using iPhones or smartphones of other brands is available is this study. On the other hand, the differences between genders on the abstract adjectives of product profile are described as follows. (1) Stylish: Both male and female participants highlight the factor of stylish lens design. They indicated that iPhone's lens' style design is more attractive than other brands. (2) Consistent: Male participants prefer smooth phone surface but female ones prefer matte texture. (3) High-quality: Both male and female participants prefer matte texture on a smartphone's back cover since they feel the quality is enhanced by the matte surface. (4) Comfortable: The result is similar to that for the Consistent factor as males prefer smooth phone surface and females prefer mattes surface. (5) Succinct: Male participants highlight slim phone designs but female participants present no significant factors for consideration. (6) Proportionally adequate: Males prefer simple and brief shapes while females prefer aesthetic style designs. The differences between males and females on the abstract adjectives of product feature are as follows. (1) Safe: No significant factor for both male and female participants. (2) Convenient: Males highlight fingerprint recognition while females pay more attention to voice assistant. (3) Efficient: Both male and female participants highlight the importance of a stable operating system. The participants agree that the iPhone's operating system is satisfying. (4) Ergonomic: Male participants highlight fingerprint recognition while female participants present no significant factor.

Smartphone vendors are advised to carry out design differentiation for different target groups. Follow-up researchers could conduct further experiments on other factors

TABLE 3: Analysis by the quantification theory type I by gender.

			Ranking #1	Ranking #2	Ranking #3	Partial coefficient of correlation
Adjectives for appearance	Stylish	Male	Stylish lens design	Simple and brief shape	Aesthetic style design	0.804
		Female	Stylish lens design	Matte texture	Smooth phone surface	0.469
	Consistent	Male	Smooth phone surface	Simple and brief shape	Slim design	0.737
		Female	Matte texture	Slim design	Simple and brief shape	0.566
	High-quality	Male	Matte texture	Aesthetic style design	-	0.750
		Female	Matte texture	Color	Simple and brief shape	0.556
	Comfortable	Male	Smooth phone surface	Color	Matte texture	0.741
		Female	Matte texture	Smooth phone surface	Color	0.332
	Succinct	Male	Slim design	Color	Smooth phone surface	0.726
		Female	Matte texture	Smooth phone surface	Color	0.599
	Proportionally adequate	Male	Simple and brief shape	Slim design	-	0.360
		Female	Aesthetic style design	Ergonomically fit	Simple and brief shape	0.186

such as gender, years of smartphone experience, or the experience with smartphones of other brands.
