Aim

**Explore the effect of the NAO, WeMO and AO climatic variability modes
on the airborne pollen series of 22 pollen types
recorded at 6 stations of the Aerobiological Network of Catalonia
during the 18-years period 1994-2011**

Area under study

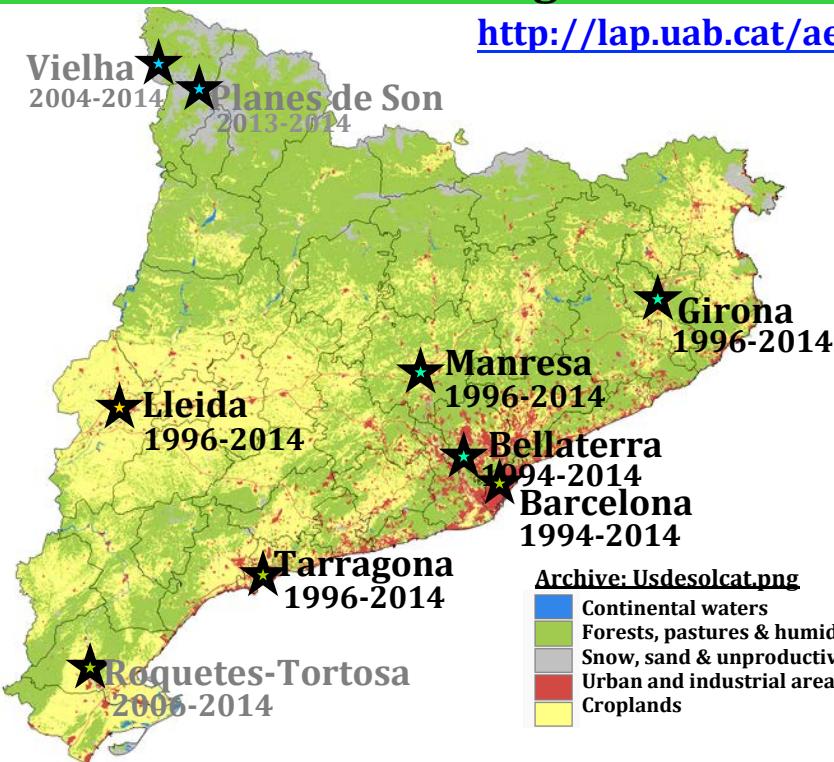

Sampling & Analysing methods

Xarxa Aerobiològica de Catalunya

<http://lap.uab.cat/aerobiologia>

Sampling stations	Geographical characteristics			Climatic characteristics (Allue Andrade 1990)		
	Altitude (m.a.s.l.)	Geographical Coordinates	Environment	Mean annual temperature (°C)	Precipitation (mm)	Phyoclimates
Vielha	974	42°42' N, 00°47' E	Rural	9.9	899	Fresh-Continental Oriental-humid
Planes de Son	1542	42°37' N, 00°14' E	Rural	7.6	760	Fresh-Continental Oriental-humid
Girona	98	41°59' N, 02°50' E	Urban	15.0	740	Fresh-Continental Oriental-semihumid
Manresa	291	41°44' N, 01°30' E	Rural/Urban	13.6	619	Fresh-Continental Oriental-semihumid
Lleida	202	41°37' N, 00°35' E	Rural/Urban	15.1	385	Fresh-Transitional-semiarid
Bellaterra	245	41°34' N, 02°06' E	Rural/Urban	15.2	594	Fresh-Continental Oriental-semihumid
Barcelona	93	41°24' N, 02°09' E	Urban	16.4	593	Fresh-Tethyc-semiarid
Tarragona	44	41°07' N, 01°15' E	Urban	15.8	478	Fresh-Tethyc-semiarid
Roquetes-Tortosa	14	40°29' N, 00°58' E	Rural/Urban	16.8	576	Fresh-Tethyc-semiarid

LEGEND

Plant type

T - tree
B - bush
H - herb

Plant Biogeography

BA - Boreo-Alpine region
ES - Euro-Siberian region
SM - Sub-Mediterranean province
M - Mediterranean region
Cm - Cosmopolitan (all regions & environments)

Plant use

S - silvestre or wild (not urban)
R - ruderal
C - cultivated (agricultura & forestry)
O - ornamental

Pollen concepts under study

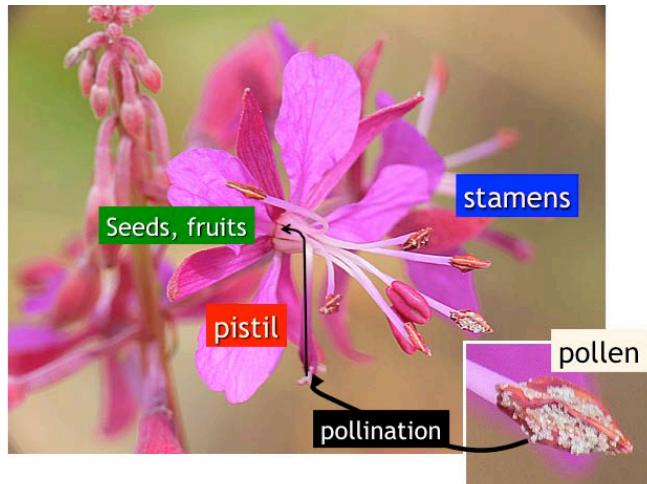

Annual Pollen Index (API)
Pollination start date (Start)
Pollination end date (End)
Pollination length (Length)

Climate concepts under study

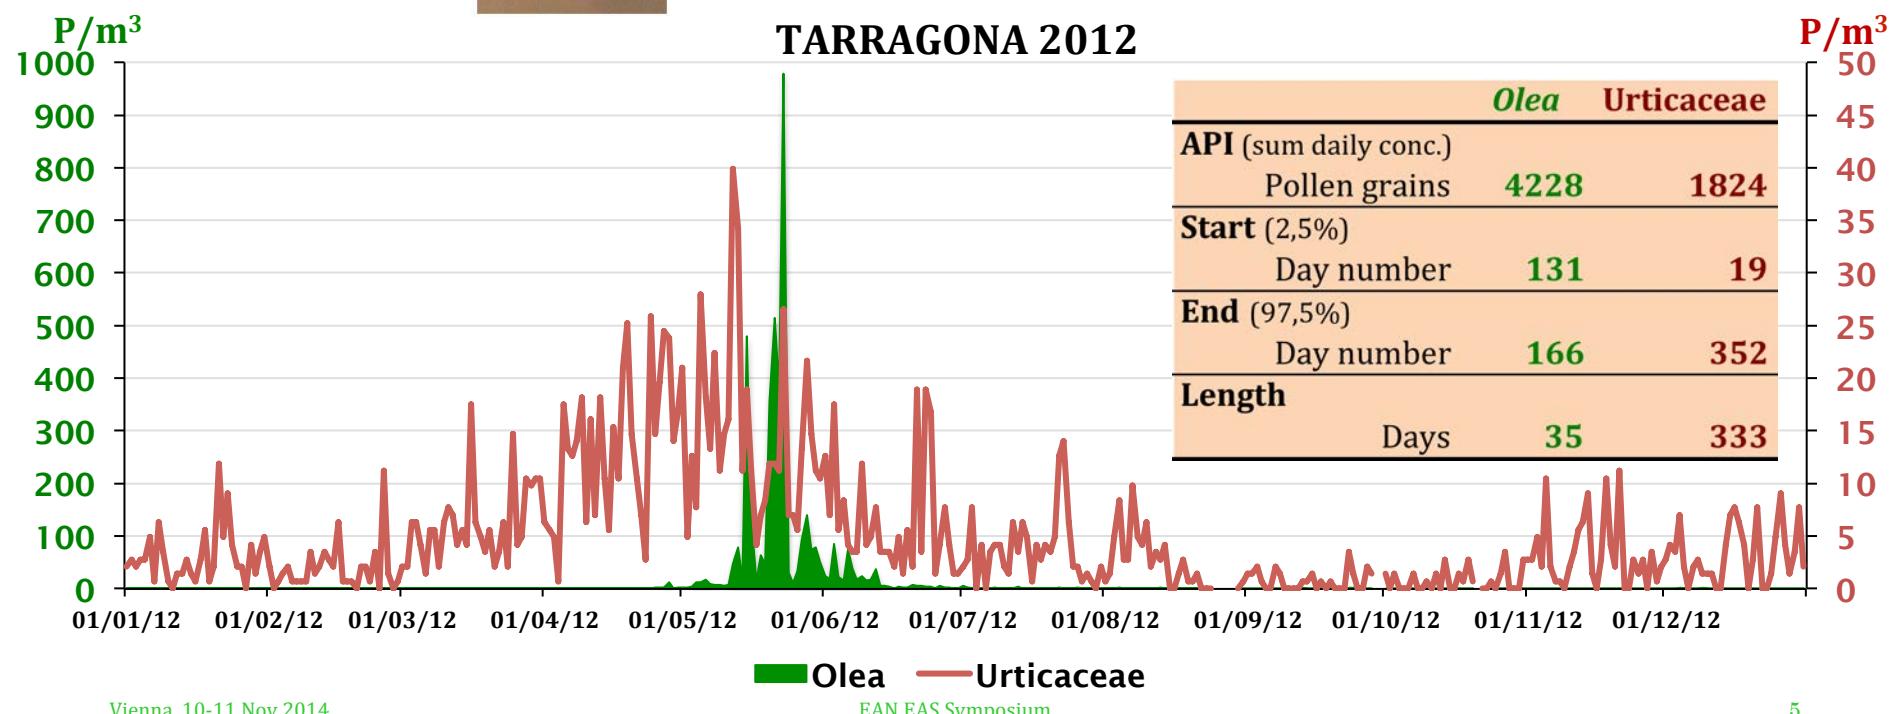

Annual and Winter (DJFM):
North Atlantic Oscillation index (NAOi)
West Mediterranean Oscillation index (WeMOi)
Artic Oscillation index (AOi)

Pollen taxa and concepts under study

Pollen concepts under study

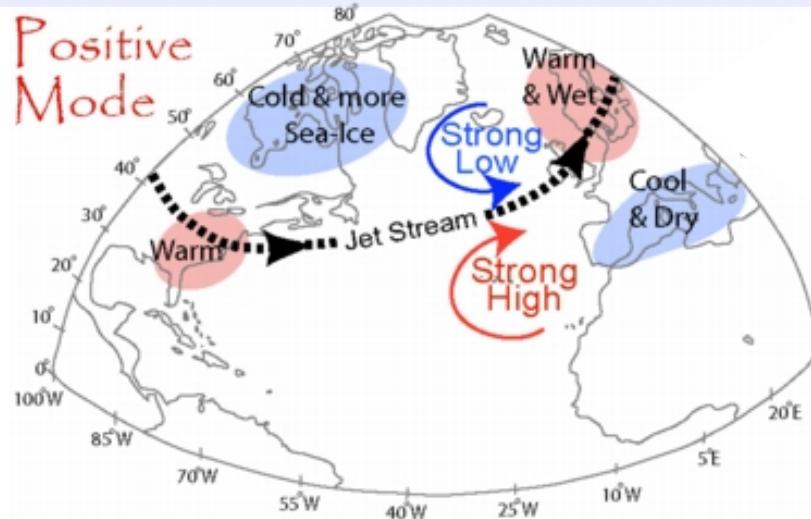

Annual Pollen Index (API)
Pollination start date (Start)
Pollination end date (End)
Pollination length (Length)

Climatic index: North Atlantic Oscillation (NAO)

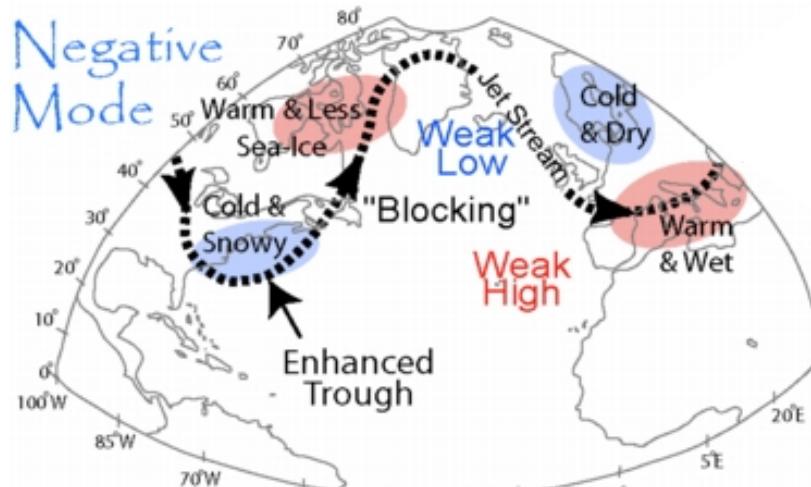

Represents the state of the atmospheric circulation **in the North Atlantic**
(dipole Reykjavik and Gibraltar)

Regulates the cyclone trajectories and cyclogenesis in the Euro-Mediterranean region

NAO +

**Lower Precipitation and higher Insolation
in southern Europe and western Mediterranean**
due to the increase of air masses from W and SW (N Africa)

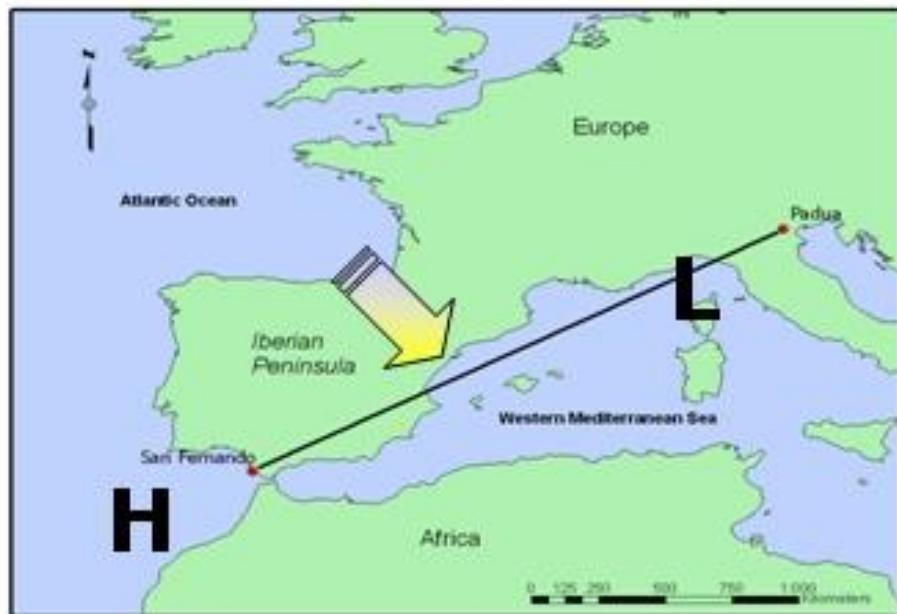

NAO -

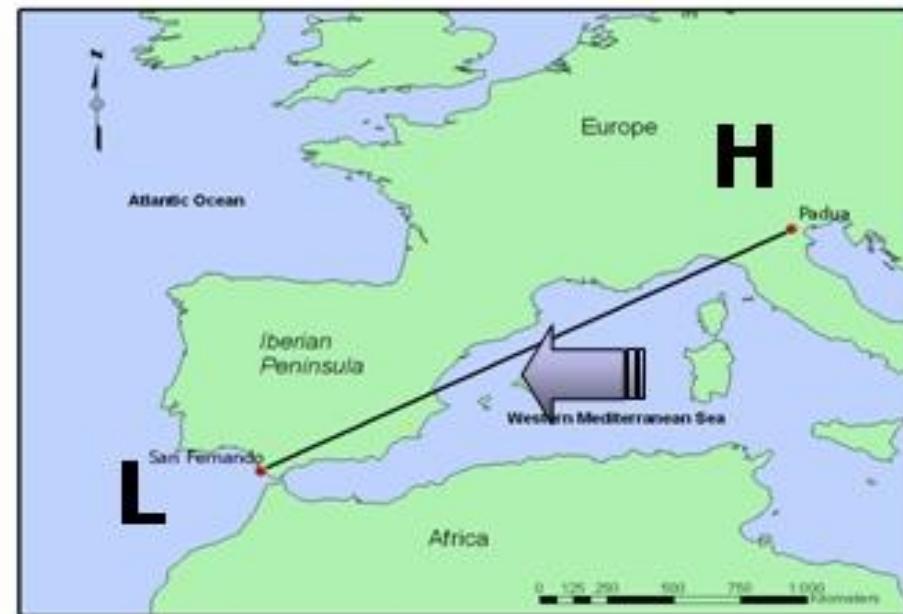

**Higher Precipitation and lower Insolation
in southern Europe and western Mediterranean**
due to the increase of air masses from the NW (Atlantic)

Climatic index: Western Mediterranean Oscillation (WeMO)

New secondary oscillation form which determines the atmospheric circulation
in the western Mediterranean basin
(dipole Padova and Cádiz)

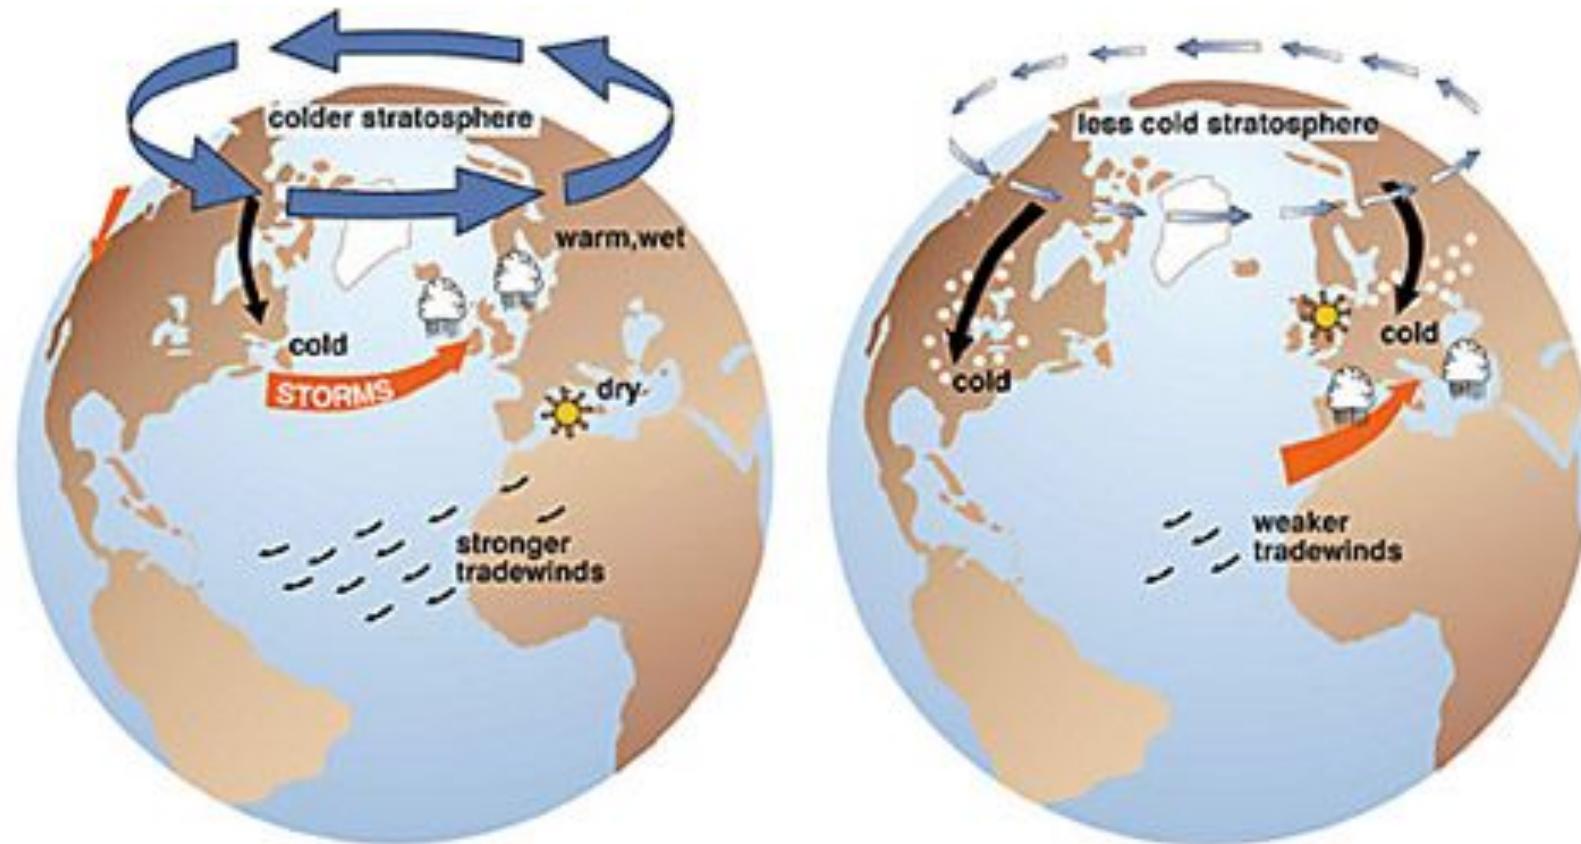

WeMO +
Lower Precipitation
in the Mediterranean coast of Iberian Peninsula
due to increase of air masses from the Atlantic

WeMO -
Higher Precipitation
in the Mediterranean coast of Iberian Peninsula
due to increase of air from the Mediterranean

Climatic index: Arctic Oscillation (AO)

Represents the state of the atmospheric circulation **over the Arctic**

AO +
Lower Precipitation
in the western Mediterranean regions
due to the increase of air masses from the Atlantic

AO -
Higher Precipitation
in the western Mediterranean regions
due to the increase of air masses from N Europe

Statistical methods

Spearman's Rank Correlation Coefficient

between the **normalized** pollen data for **API, Start, End and Length**
and the **NAO, WeMO and AO annual and winter (DJFM) indices**
using SPSS 19.0

Key to the interpretation of the results

NAO +
WeMO + Lower Precipitation and higher Insolation in the Mediterranean
AO +

NAO -
WeMO - Higher Precipitation and lower Insolation in the Mediterranean
AO -

A **Positive** Rank Correlation between NAO/WeMO /AO and

- API means that **lower Precipitations in the Mediterranean coincide with high API and viceversa.**
- Start/End/Length mean that **lower Precipitations in the Mediterranean coincide with later/longer pollination and viceversa.**

A **Negative** Rank Correlation between NAO/WeMO /AO and

- API means that **lower Precipitations in the Mediterranean coincide with low API and viceversa**
- Start/End/Length mean that **lower Precipitations in the Mediterranean coincide with earlier/shorter pollination and viceversa.**

CONCLUSIONS

API/Climatic indices - most of the taxa significant negative correlations

The **wetter conditions** associated with the negative mode of the climatic indices in Catalonia coincide with **higher API values**.

The only exception was *Corylus* which showed positive significant correlations for all stations.

Start/Climatic indices - most of the taxa significant negative correlations

The **dryer and more isolated conditions** associated with the positive mode of the climatic indices in Catalonia coincide with an **advance in the pollination start**.

The only exception were *Ambrosia*, *Castanea*, *Fagus* and *Betula* which are Eurosiberian taxa often long range transported.

End/Climatic indices - most of the taxa significant positive correlations

The **rainy conditions** associated with the negative mode of the climatic indices in Catalonia favors the cleaning of the atmosphere and the **advance in the pollination end**.

The most **vulnerable** taxa (more significant correlations) with regard to API were ***Corylus*, *Olea*, *Platanus* and *Quercus* deciduous type**.

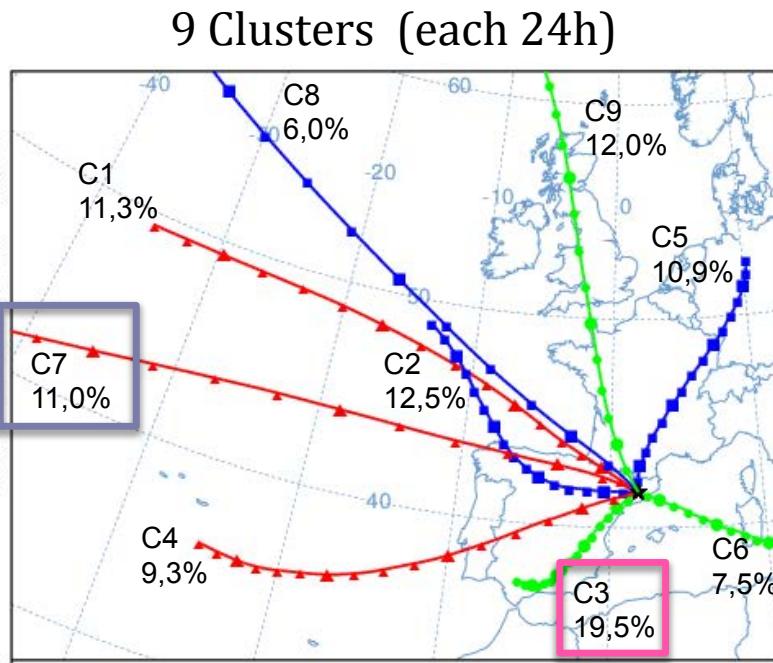

WeMO is the index showing more significant correlations with API.

NAO is the index showing more significant correlations with **End of pollination**.

AO, closely followed by NAO and WeMO, is the index showing more significant correlations with **Pollination Start**.

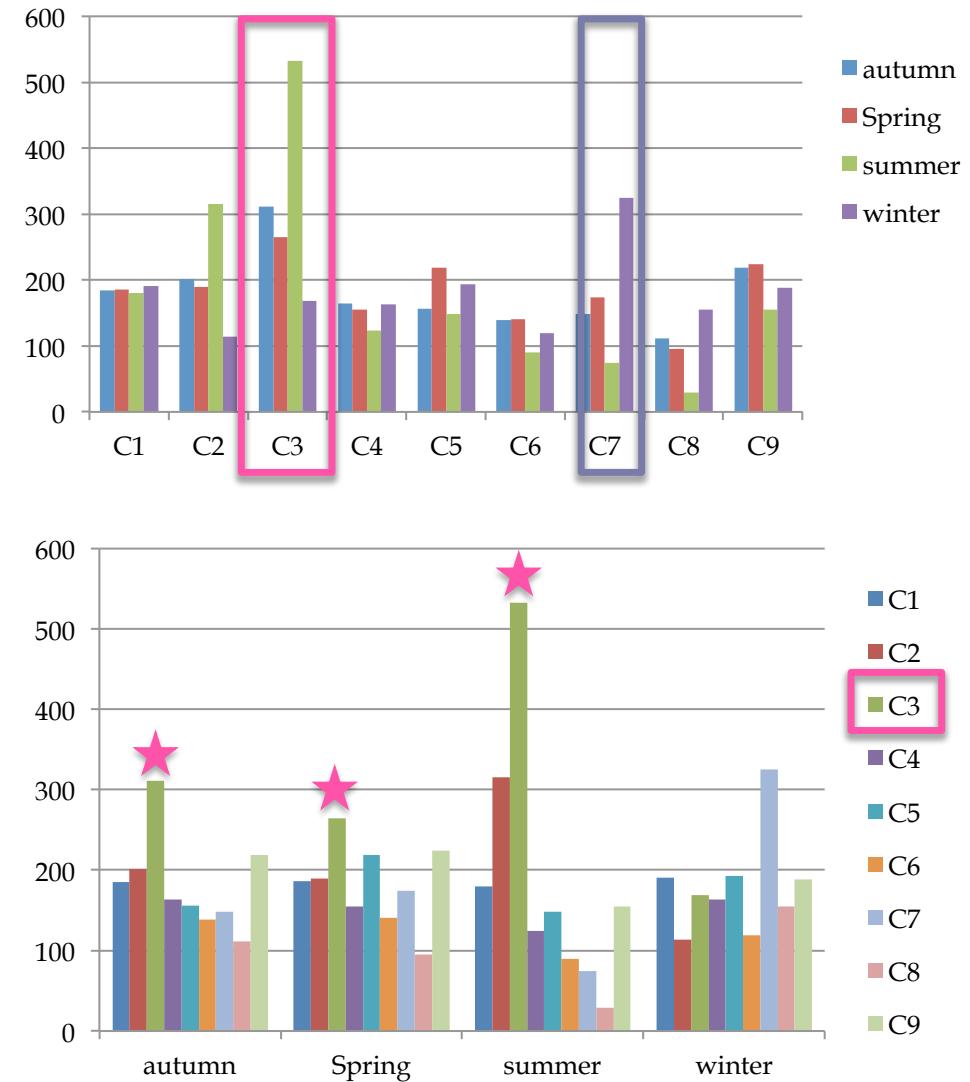

CONTINUATION: Daily back-trajectories cluster analysis

Period 1994-2011: 96-h isosigma back-trajectories at 12:00 UTC and 1.500 m.a.s.l.
 (HYSPLIT 4.0 at <http://www.arl.noaa.gov/ready/hysplit4.html>, Draxler and Rolf 2003)

- C1, C7 and C8 **Atlantic mean and long distance** (28,3%)
- C4 **Atlantic mean distance** (and Iberian Peninsula) (9,3%)
- C9 **Europe (N) long distance** (12,0%)
- C5 **Europe (NE) short distance** (10,9%)
- C6 **Mediterranean and S Europa** (7,5%)
- C2 and C3 **Iberian Peninsula recirculation** (32,0%)

Work in progress...
