

Using a CRIS to support communication of research: mapping the publication cycle to deposit workflows for data and publications

Federica Fina, Data Scientist, ff23@st-andrews.ac.uk

Jackie Proven, Repository & Open Access Services Manager,
jep10@st-andrews.ac.uk

Research data requirements

- Funders are: RCUK, EC (Horizon2020), the Royal Society, and others.
- Applies to published results

Data Management Plan (DMP):

 how researchers intend to comply; what will be shared; where data will be archived; agreements with collaborators

Publications:

 acknowledge funder (grant number) and include a statement on how to access supporting data (where? On which conditions?)

Data:

- should be made publicly available
- should be retained at least <10 years> from last date of access

Costs:

could be included in grant applications

Open Access requirements

- Funders include: RCUK, EC (Horizon2020), the Wellcome Trust, and others
- Policy for the next REF: http://www.hefce.ac.uk/rsrch/oa/
- Applies to published results

Publications:

- acknowledge funder (grant number)
- o certain publication types need to be OA under certain rules

Repository deposit:

- should be made publicly available (when?)
- should be the correct version and comply with copyright (how?)

APC costs:

- o centrally funded by some funders (which?)
- o in some cases costs should be included in grant applications

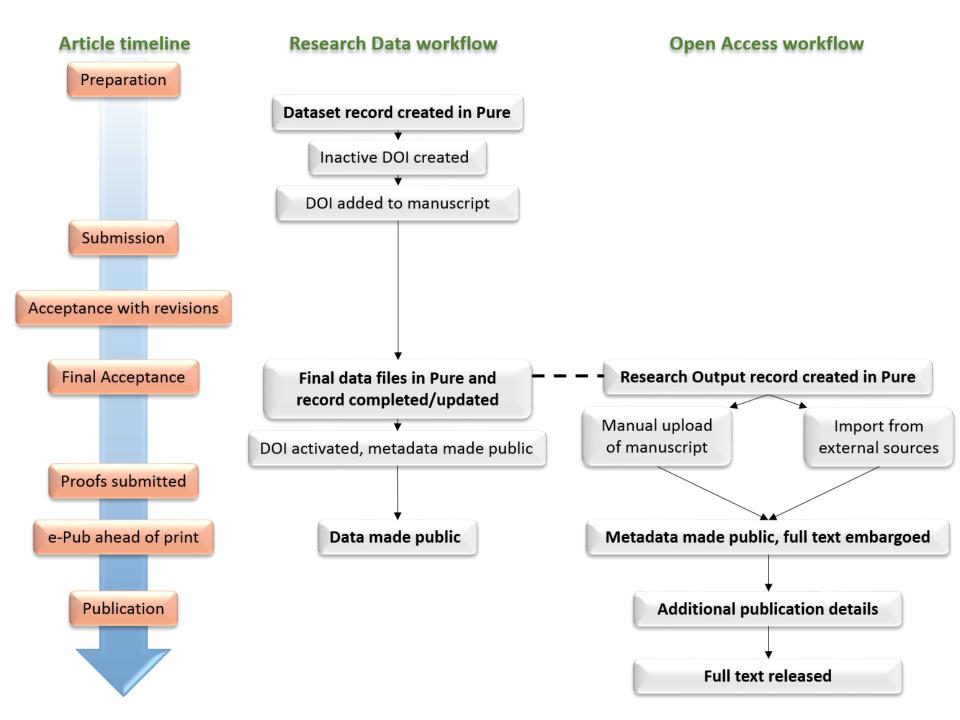

Researchers' questions

<u>OA</u>

- Why do I have to do this?...
- "Open Access is here: make sure you are ready!"
- When and how do I upload my article?
- When and how will my manuscript be made public?
- ...Do I need to pay?
- ...Does my publisher allow this?
- ...etc./...

RDM

- Why do we have to do this?
- What data should I deposit?
- What formats should we use?
- How and when should I deposit the data?
- Where and when can I obtain a DOI for my data?
- How do I link, in the CRIS, my data to my publication?

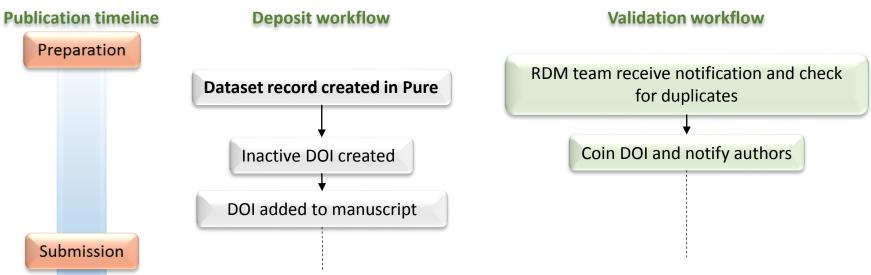

RDM deposit and validation workflow I

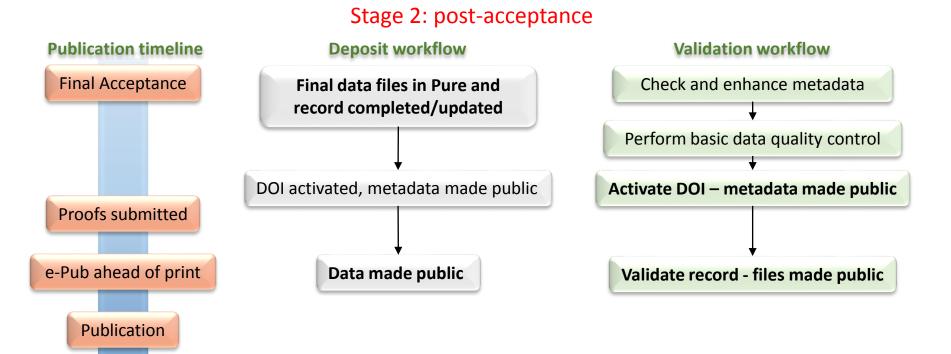

- Datasets are created both by authors and RDM team
- We do not explicitly offer mediated deposit for datasets
- No support at school level yet

RDM deposit and validation workflow II

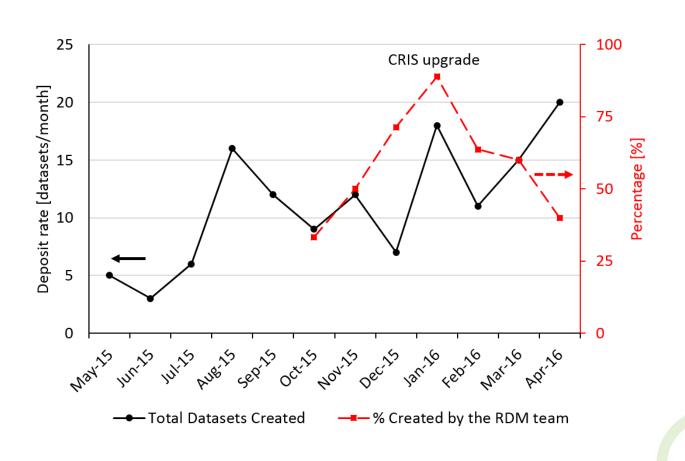

Pure offers integration with DataCite to activate DOIs

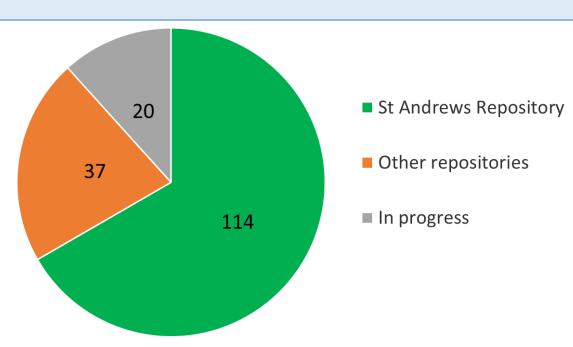

Research data deposit trend

Our datasets since June 2015

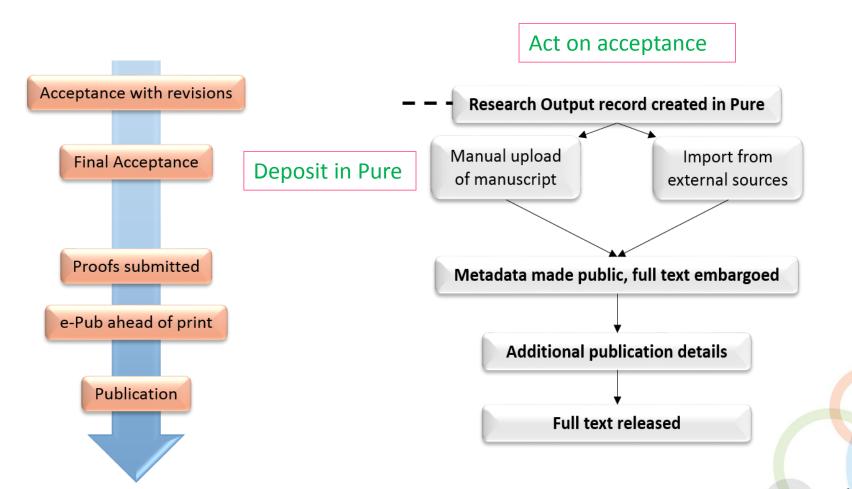

- 171 dataset records in Pure
- 114 dataset records with files in St Andrews' repository
- 20 datasets in progress
- 37 datasets deposited elsewhere but with metadata in Pure (CRIS as a catalogue)

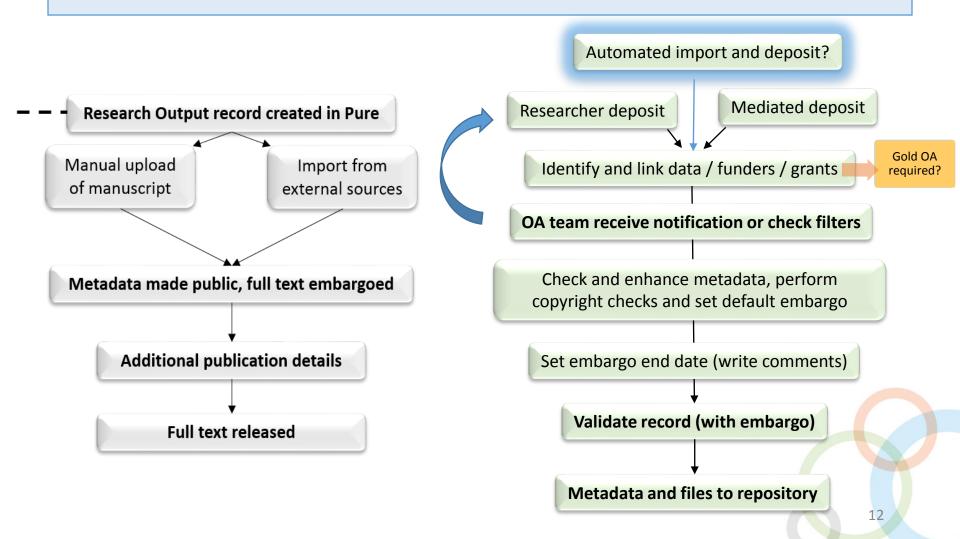

OA deposit workflow

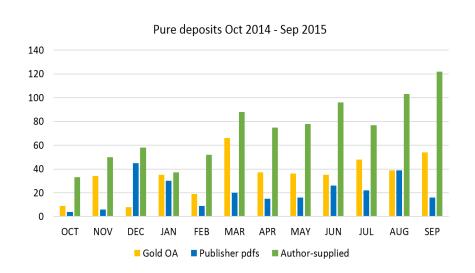

OA roles and validation workflow

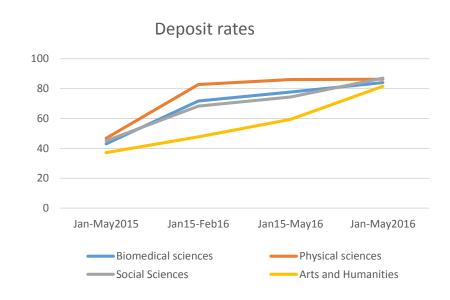

OA deposit trends

- Quick wins
- Rise in author-driven deposits during pilot phase

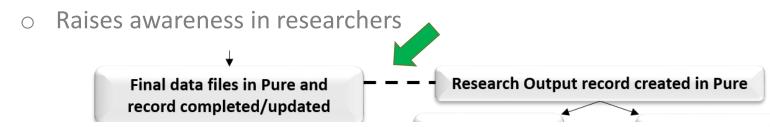

- Current deposit rates by subject area
- Early increase in pilot Schools
- Gradual increase in Arts & Humanities

Joint approach

- Delivering joint OA-RDM Pure tutorials:
 - being able to address any questions related to OA and/or RDM
 - giving a complete overview of the processes and overlaps
- Drop-in sessions in schools
 - bringing the service to the researchers
- Cross-team communications

- Shared staff posts between Library and Research Policy Office
 - brings together all the CRIS administrators

How does it all look?

Data underpinning - Dynamic covalent assembly and disassembly of nanoparticle aggregates

Description

Data for publication "Dynamic covalent assembly and disassembly of nanoparticle aggregates"; DOI: 10.1039/c6cc00135a

The following file types are included:

- NMR spectroscopy files
- UV-Vis spectroscopy files
- Transmission electron microscopy images

Earth and Environmental Sciences St Andrews Isotope Geochemistry

Abstract

The Great Oxidation Event (GOE) represents a crucial juncture in Earth history, signifying the rise in atmospheric oxygen from parts per million to per cent levels at ~2.45-2.32 billion-years-ago (Ga). Although planetary oxygenation undoubtedly led to the inception of the contemporary Earth system, the trigger(s) and mechanism(s) controlling this chemical reorganisation remain elusive. Quantitative estimates of the atmosphere's composition in the prelude to the
