Development and Confirmatory Factor Analysis of the Non-Violent and Violent Offending Behavior Scale (NVOBS)

Abigail J.V. Thornton*, Nicola Graham-Kevan, and John Archer

School of Psychology, University of Central Lancashire, Preston, United Kingdom

The purpose of this research was to develop a psychometrically sound measure of violent and non-violent offending, suitable for both male and female participants in general (non-forensic) samples. Potential items were selected from existing measures. A sample of 653 British university students completed all items, and their responses were analyzed using exploratory factor analysis and validated with confirmatory factor analysis. There were five separate factors (general violence, drug-related offenses, partner violence, theft, and criminal damage), which were confirmed with acceptable fit indices. The five-factor model applied to both males and females. Each subscale demonstrated good internal consistency, with alphas for each factor ranging from moderate to good. This new measure is a potentially valuable research tool for investigating people's involvement in violent and non-violent offending. The importance of examining the psychometric properties of scales, and confirming the category groupings using CFA of the items is outlined. *Aggr. Keywords: domestic violence; general violence; offending; sex differences; scale development

INTRODUCTION

General^{Q2} violence and non-violent behavior are frequently examined together in the criminological literature. Intimate Partner Violence (IPV) is generally studied separately from other types of crime as it is perceived to be a unique and specialist type of crime warranting its own research, theories and interventions (Daly & Wilson, 1988; Dobash & Dobash, 1992; Hotaling, Straus, & Lincoln, 1990; Gelles & Straus, 1979; Giles-Sims, 1983). In contrast with this, Gottfredson and Hirschi (1990, 2007) concluded that offenders have a propensity to commit a wide variety of criminal acts, and specialism in one type or another is quite rare. Similarly, the longitudinal research by Farrington et al. (2006) found that self-reported offenders tended “to be deviant in many aspects of their lives.” A review of criminal careers research (DeLisi & Piquero, 2011, p. 291) again found that “virtually all offenders are generalists.” These sources all suggest that offenders are likely to be criminal generalists rather than specialists, and that the perpetration of violent and non-violent offending is likely to overlap. There is at present no comprehensive measure that combines both violent and non-violent offenses. It was the purpose of this study

to design such a measure so as to facilitate research on the generality of offending.

Measuring IPV, Violent, and Non-Violent Crime

Although the three offense areas are usually studied separately, some research has examined them together. Moffitt, Kreuger, Caspi, and Fagan (2000) investigated partner violence and general crime in 21-year-old men and women. Partner violence was measured using 13 items which consisted of the nine physical assault items from the original Conflict Tactics Scale (Straus, 1979), plus four new items, involving twisting the partner's arm, forced sex, shaking the partner, and throwing you are the partner bodily (Moffitt et al., 1997). The Self-Report Delinquency interview was used to measure general crime. General violence was measured using five items. Non-violent offending was split into three categories; theft (12 items), fraud (9 items), and vice (23 items). The

1 researchers found that many perpetrators of partner
2 violence also engaged in physical aggression towards.

3 Straus and Ramirez (2004) investigated the violent and
4 non-violent criminal history of male and female IPV
5 perpetrators. They measured partner violence using the
6 12-item physical assault scale from the CTS2 (Straus,
7 Hamby, Boney-McCoy, & Sugarman, 1996). These 12
8 items consisted of 5 minor assault items and 7 severe
9 assault items. Criminal history was measured by four
10 items, two involving violent crime (physical attack
11 and carrying a hidden weapon), and two involving
12 stealing. These four questions were asked for crime
13 perpetrated before and after age 15, so that there were
14 eight items in total. The research found that a prior
15 criminal history predicted IPV perpetration, and the
16 relationship was stronger for prior violent crime than for
17 property crime.

18 Where previous research has involved the three offense
19 types (violent, partner violent and non-violent crime)
20 different measures, with different response formats have
21 been used to assess each one, with some being very brief
22 (e.g., Straus & Ramirez, 2004). The problem with using
23 different measures with different response formats is that
24 the results are not directly comparable as there will be
25 different variance in the units of measurement for each
26 variable, which introduces different elements of mea-
27 surement error and bias. The problem with using scales
28 with different numbers of items is that it is not possible to
29 ascertain if the higher prevalence or frequency of
30 offending is simply due to there being more items on
31 that particular scale. It is also difficult to compare
32 between different offenses if different measures have
33 been used. Other potential problems include not separat-
34 ing general violence and non-violent offending (e.g.,
35 Moffitt et al., 2000), precluding the exploration of
36 differences between general violence and non-violent
37 crimes. The current study seeks to overcome these limita-
38 tions by creating a scale that allows the three offense
39 types to be measured and analyzed as three separate
40 domains.

41 Although there are other comprehensive measures,
42 such as the British Crime Survey (BCS) for the UK, the
43 National Crime Victimization Survey (NCVS) for the
44 US, and the Uniform Crime Reporting Survey (UCRS)
45 for Canada, the questionnaire developed in this study is
46 much shorter and more suitable for use in psychological
47 research, where it can be administered alongside other
48 measures. Problems associated with the existing meas-
49 ures include the national crime surveys only measuring
50 crimes that have a direct victim, so that victimless crimes
51 (such as drug taking) are excluded. These are included
52 in the current measure, making it a more comprehen-
53 sive assessment of self-reported offending behavior.
54 Crime surveys measure only crime victimization,

whereas the current questionnaire also measures offense
perpetration. It therefore provides a comprehensive
measure for use in psychological research.

To overcome the limitations in existing measures,
outlined above, a measure is required which has
comparable questions for all three offense types, which
uses the same response method throughout, and has a
wide variety of criminal acts included, so that the profile
of men's and women's offending can be adequately
captured. The current research involves the development
of such a scale.

The Overlap

This divide between research on IPV and other crime
may be borne out of feminist conceptualizations, where
IPV, unlike other violent and non-violent crime, is
viewed as being uniquely the consequence of patriarchy,
and is therefore solely (or largely) regarded in terms of
men aggressing against women (e.g., Dobash &
Dobash, 1980, 1998, 2004; Dobash, Dobash, Cavanagh,
& Lewis, 1998; Dobash, Dobash, Wilson, & Daly, 1992;
Henning, Jones, & Holdford, 2003). The evolutionary
view parallels this, highlighting the uniqueness of
intersexual aggression as the consequence of mate-
guarding arising from paternity uncertainty (e.g., Wilson
& Daly, 1992, 1996). From both the feminist and
evolutionary perspectives, IPV is portrayed as a unique
and specialized crime due to victim choice, in that victims
are female and in an intimate relationship with a male
perpetrator (but see Archer, 2012; Felson, 2002; Graham-
Kevan & Archer, 2009).

In contrast, research from a more psychological or
criminological perspective has recognized the heteroge-
neity of IPV perpetrators, with some being exclusively
violent within their intimate relationship and others being
violent in more than one context, that is, their violence is
not limited to their partner but occurs out of the home as
well. Research dating back to the 1980s (e.g., Cadsky &
Crawford, 1988; Fagan, Stewart, & Hansen, 1983;
Gondolf, 1988; Shields, McCall, & Hanneke, 1988)
has identified this overlap in the perpetration of general
violence and IPV. These classifications have more
recently been confirmed for both male (Holtzworth-
Munroe, Meehan, Herron, Rehman, & Stuart, 2000) and
female (Babcock, Siard, & Miller, 2003) perpetrators.
Babcock et al. (2003) concluded that the findings for
women parallel those for men, with perpetrators of IPV
being a heterogeneous group. Male typologies of violent
behavior have been developed and extensively re-
searched (e.g., Holtzworth-Munroe & Stuart, 1994),
but consideration of female typologies and how they
relate to the male research is sparse. Although an
association between types of violent offending has long
been identified, investigation into the overlap of

offending behavior in men and women has largely been neglected, particularly for women.

Risk Factors for IPV, Violent, and Non-violent Crime

Previous research has examined the criminal histories of men and women who perpetrate IPV, and has found that a substantial subgroup of these men and women have prior convictions for crimes unrelated to partner abuse (Babcock et al., 2003; Busch & Rosenberg, 2004; Buzawa, Hotaling, Klein, & Byrne, 1999; DeLucia, Owens, Will, & McCoin, 1999; Henning & Feder, 2004; Moffitt et al., 2000, 2001). This research provides evidence for the interrelatedness of the three different types of crimes, and provides a rationale for assessing them all in the same sample.

Additionally, research has shown that risk factors for aggressive and antisocial behavior tend to be shared by both boys and girls (Broidy^{Q3} et al., 2003; Côté, Tremblay, Nagin, Zoccolillo, & Vitaro, 2002; Moffitt et al., 2001), and that the same influences predict both general and partner aggression in men and women (Moffitt et al., 2000; Tremblay et al., 2004). These shared risk factors include low self-control, negative emotionality, low intelligence and empathy deficits, and suggest that the different forms of aggression are developmentally similar and likely to co-occur.

Aggressive adults are highly likely to have a history of aggressive behavior beginning in childhood (Conradi, Geffner, Hamberger, & Lawson, 2009; Hay, 2005). Longitudinal research has found that men and women with a history of conduct problems are more likely to enter into a relationship with a violent partner, and are likely to perpetrate violence towards their partners, in excess of their own victimization (Moffitt et al., 2001), suggesting that IPV “is but another expression of an earlier emerging antisocial propensity” (Moffitt et al., 2001, p. 65). Longitudinal data have demonstrated that the overlap between IPV and general violence perpetration is similar for men and women, showing that partner-violent men and women at age 21 were more likely to aggress against non-family members than those who were non-violent to their partners (Moffitt et al., 2000). This research demonstrates that different types of aggressive and antisocial behaviors share similar risk factors and are likely to co-occur in both sexes.

Studying Violent and Non-Violent Offending of University Students

Although students are generally thought to be relatively law-abiding, especially with regards to violent crime, there is one violent crime which has been found to be prevalent in student populations, and that is IPV (e.g., Fiebert & Gonzalez, 1997; Foo & Margolin, 1995;

Nabors, 2010; Riggs & O’Leary, 1996; Straus, 2008; Straus & Ramirez, 2004; White & Koss, 1991). Therefore, using this population allows us to examine the overlap of self-reported offending in a non-selected sample. Although violent and non-violent crime in university students may be low compared with other populations, research shows that these behaviors are present: they may just be less frequent in students. Therefore, other samples are likely to show similar patterns of offending, only at higher rates. Statistics show that students form quite a large part of the population in many countries, for example, in the UK there are approximately 2.5 million students (Higher Education Statistics Agency: HESA, 2011). Universities are employing strategies to widen participation to make university more accessible to underrepresented groups, and HESA collects and provides statistics on this. The university that this sample was taken from is above the UK average for widening participation to underrepresented groups, including those from low participation neighborhoods (top 10), and those from lower socioeconomic statuses (top 25) (HESA, 2011). Therefore, the population from which the current sample was derived has a reasonably wide demographic representation for a University sample.

In summary, the aim of this research is to create a psychometrically sound scale that allows the separate assessment of violent and non-violent offending in men and women. To achieve this, we conducted exploratory factor analysis, and then confirmatory factor analysis, on the Non-violent and Violent Offending Behavior Scale (NVOBS: Thornton, Graham-Kevan, & Archer, 2010) for men and women, together and then separately, to create a scale appropriate for use with both sexes. Additionally the scale was assessed for reliability.

METHOD

Item Selection

Potential items were selected by reviewing existing measures of delinquency (which included items relating to general violence and non-violent offending) and partner violence and, in order to include a broad range of both violent and non-violent criminal acts (e.g., Bendixen & Olweus, 1999; Borjesson, Aarons, & Dunn, 2003; Dahlberg, Toal & Behrens, 1998; Huizinga, Esbensen, & Weiher, 1991; Mak, 1993; Moffitt & Silva, 1988; Moffitt et al., 1997; Straus, 1979; Straus, Hamby, Boney-McCoy, & Sugarman, 1996). Initially, 119 items were selected from the literature review and a pilot study was conducted to investigate the prevalence of the behaviors in women as violent and criminal scales tend to be developed on men. A number of items from the earlier measure used in the pilot study were eliminated due to

very low endorsement (endorsed by <1% of the sample; e.g., Used a weapon on someone, Choked partner, Sold cocaine, Arson, Stole over £100), suggesting that these behaviors may not be characteristic of university students. Therefore, a final pool of 70 items was generated and used in the current research. The general violence and IPV items were duplicates of each other in order that the same items were captured. Items were adapted for use in the current study so that they all had the same response options.

Data Collection

Data were collected from a total of 653 participants (300 [45.9%] men and 353 [54.1%] women). A subset of the present sample was published as a study investigating predictors of offending (Thornton, Graham-Kevan, & Archer, 2010). The present analysis does not overlap with what was reported there. The study was approved by the University of Central Lancashire Ethics Committee. Participants were either undergraduate or postgraduate students from a variety of courses, recruited on campus at a British university. Inclusion criteria comprised: being in a heterosexual relationships for at least one month in the past 12 months, and being over 18 years of age. Age ranged from 18 to 56 and the mean age was 22.14 years (men: 22.22; women: 22.08). It is important that men and women were matched for age as research has shown that violence (e.g., Archer, 2004) and offending (Gottfredson & Hirschi, 2007) decrease with age: therefore failure to match men and women on age could distort sex differences. There was no significant sex difference for age ($t(651) = .17, P = .87$). Participants who consented were administered questionnaires containing the 70 items, and were asked to report the extent to which they had been violent towards their partners, violent towards others, and engaged in non-violent offenses in the past 12 months (see Appendix 1 for instructions to participants). The 12-month time period is commonly used in both studies of IPV (e.g., Straus, 1979; Straus, Hamby, Boney-McCoy, & Sugarman, 1996), and in general aggression research (e.g., Richardson & Green, 1999, 2003). Items were answered on a 7-point scale of 0 (never happened) to 6 (happened more than 20 times). Straus et al. (1996) recommend recoding the responses to weight the data by creating midpoints for each of the items as follows: 4 (3–5 times), 8 (6–10 times), 15 (11–20 times), and 25 (more than 20 times: 25 is an assumed midpoint and is recommended by Straus et al., 1996, p. 305). Therefore, this procedure was adopted here.

RESULTS

For the purposes of factor analysis, the sample was randomly divided into two sub-samples, one used to

conduct exploratory factor analysis ($n = 337$, men = 152, women = 185) and the other used to validate the structure using confirmatory factor analysis ($n = 316$, men = 148, women = 168). To examine potential sex differences, exploratory factor analyses were also conducted separately for men and women. The sexes were matched for age within each subsample.

The dataset was initially assessed for suitability for factor analysis. The Kaiser–Meyer–Olkin (KMO) measure of sampling adequacy ranges from 0 to 1, and the result should be .6 or above to show appropriateness for factor analysis (Field, 2009; Kaiser, 1974; Tabachnick & Fidell, 2007). For this study $KMO = .76$, which is above the recommended minimum value. Bartlett's test of sphericity was statistically significant ($\chi^2(903) = 6515.93, P < .001$), indicating that the inter-item correlations were sufficiently large for principal component factor analysis. Therefore, the data are suitable for factor analysis.

A principal component analysis (PCA) with Varimax (orthogonal) rotation was conducted. Oblique rotation (Direct Oblimin) was also tested: however, the inter-factor correlations were all weak (.2 or below). Therefore, the decision to use an orthogonal rotation method was justified (Pedhazur & Schmelkin, 1991).

The number of factors to retain is often determined by a Scree test (Cattell, 1966; Klein, 1994). However, the Scree test can be subject to ambiguity where there is either no clear break in the curve or where there appears to be more than one definite break. Since the Scree plot was ambiguous in this case, Horn's Parallel Analysis was used (Horn, 1965). Parallel analysis (PA) calculates average eigenvalues from a random dataset that is based on the sample size and number of variables contained within the real dataset. The real eigenvalues are then compared with the random eigenvalues, and only those where the actual values are higher than the corresponding random values are retained (see Hayton, Allen, & Scarpello, 2004 for an outline of the PA procedure). Following parallel analysis, five factors were retained for the final solution. Together these five rotated factors explained 42.95% of the total variance. By studying the items that load on to each factor, the five factors were labeled, as (1) general violence, (2) drug-related offenses, (3) IPV, (4) criminal damage, and (5) theft. Only items which loaded $>.4$ on to at least one factor (Stevens, 1992) were retained, and no items loaded on more than one factor. Factor 1 (general violence) contained 12 items, factor 2 (drugs) contained 5 items, factor 3 (IPV) contained 8 items, factor 4 (criminal damage) contained 4 items, and factor 5 (theft) contained 4 items. Because each factor is measuring a different offense related dimension, the factors will now be referred to as subscales. The factor loadings for each item, along

with Eigenvalues and percentage variance explained by each subscale, are displayed in Table 1 for the final rotated solution.

Reliability analysis was used to measure the internal consistency of the subscales. Cronbach's alpha coefficient (α) is one of the most popular indicators of internal consistency (Field, 2009). Alphas for each subscale on the NVOBS ranged from acceptable to good, since all were above .7 (see Table 1). To examine potential sex differences, exploratory factor analyses were also conducted separately for men and women. Examination of the factor compositions and percentage variance explained suggested similarities between the sexes: therefore, data were combined for men and women.

Confirmatory Factor Analysis

The model fit of the five-factor solution was tested using confirmatory factor analysis, performed using AMOS version 18.0. Item parcels were used to reduce the number of individual items entered into confirmatory factor analysis, in order to increase the stability of parameter estimates (Holt, 2004). To create parcels, scale items were bundled by averaging items. Averaging keeps the means more interpretable and comparable regardless of the number of items in the bundle. One of the chief advantages of parceling is that it improves the subject to variable ratio. Table 1 shows the parcel placement for each item. Model fit was assessed using comparative fit index (CFI), root mean square error of approximation (RMSEA), and goodness of fit index (GFI). The current model was recursive and identified. Confirmatory factor analysis produced a model of good fit ($\chi^2 = (55) 147.90$, $P < .001$, RMSEA = .07, GFI = .94, CFI = .94). For completeness, the model fit of the three factor (general violence, IPV, and non-violent offending) conceptual model suggested in the introduction was also tested. The results showed that the three factor model was not as good a fit to the data as the five-factor model ($\chi^2 = (62) 303.00$, $P < .001$, RMSEA = .08, GFI = .91, CFI = .91). Therefore, the five-factor model was selected as the final model.

Further Analyses of the NVOBS Subscales

Subscales were derived from the factors by totalling the items for each of the five resulting offending behavior subscales. The subscale totals were screened for outliers and normality (Tabachnick & Fidell, 2007). Outliers were reduced so that extreme scores were one more than the next most extreme score. Descriptive statistics are provided for each subscale (i.e., general violence, drug-related behavior, IPV, criminal damage, and theft) in Table 2.

It is evident from Table 2 that the data are over-dispersed (standard deviations are higher than the

* $P < .001$.

corresponding means). This sort of distribution is typically found in studies of IPV using the Conflict Tactics Scale and similar measures (Straus, 1979; Straus et al., 1996). The preferred method for such datasets, which are truncated at zero, highly skewed in the positive direction, and overdispersed (standard deviations are higher than the corresponding means), is negative binomial regression (Gardner, Mulvey, & Shaw, 1995; Hilbe, 2007⁹⁴; Hutchinson & Holtman, 2005). This has been used in recent studies of IPV (e.g., Archer, Fernández-Fuertes, & Thanzami, 2010; Finkel, DeWall, Slotter, Oaten, & Foshee, 2009), and was used in the present case to test for differences between the factor analysis and the confirmatory factor analysis subsamples on each of the five NVOBS subscales. The Goodness of Fit statistics were satisfactory as the Deviance value should be near 1 (general violence: Value/df = 1.11; drugs: Value/df = 0.79; IPV: Value/df = 0.84; criminal damage: Value/df = 0.61; theft: Value/df = 0.69). There were no significant differences between the factor analysis and confirmatory factor analysis subsamples on each of the five NVOBS subscales: general violence (Wald χ^2 (1) = 0.97, $P = .33$), drug offenses (Wald χ^2 (1) = 0.07, $P = .79$), IPV (Wald χ^2 (1) = 0.14, $P = .71$), criminal damage (Wald χ^2 (1) = .75, $P = .39$), and theft offenses (Wald χ^2 (1) = 0.13, $P = .72$). Therefore, the data from the two subsamples were combined, and means, standard deviations, and frequencies of scores were calculated for each subscale overall, and for men and women separately.

Negative Binomial Regressions (NBR) were used to test for sex differences on the five NVOBS subscales (see Table 2 for the NBR results). The Goodness of Fit statistics were again satisfactory as the Deviance values were near 1 (general violence: Value/df = 1.11; drugs: Value/df = 0.78; IPV: Value/df = 0.85; criminal damage: Value/df = 0.62; theft: Value/df = 0.69). Men perpetrated higher levels of general violence (Wald χ^2 (1) = 21.89, $P < .001$), drug offenses (Wald χ^2 (1) = 10.97, $P < .001$), criminal damage (Wald χ^2 (1) = 16.66, $P < .001$), and theft offenses (Wald χ^2 (1) = 15.34, $P < .001$) than women, but women perpetrated significantly more IPV (Wald χ^2 (1) = 51.32, $P < .001$) than men. According to Cohen's (1988) criteria, effect sizes (shown in Table 2) were small for drug offenses, theft and criminal damage, and medium for IPV and general violence.

Intercorrelations Between the Five Offending Behaviors

Table 3 shows the Pearson correlations between the five identified offense types separately for men and women to demonstrate the interrelatedness of offending for men and women. The results revealed small to moderate significant correlations between all offenses for women, and small to moderate significant correlations between most offenses for men. For men IPV was not correlated with drug offenses or criminal damage. Overall the correlational results suggest that men's and women's violent and nonviolent offending is interrelated,

TABLE 3. Pearson Correlations for All Five Categories of Offending Behavior for Men and Women

	Men					Women				
	GV	IPV	Drugs	CD	Theft	GV	IPV	Drugs	CD	Theft
GV	—	.20*	.18*	.35*	.33*	—	.28*	.20*	.31*	.26*
IPV		—	.03	.01	.20*		—	.23*	.21*	.23*
Drugs			—	.38*	.40*			—	.35*	.39*
CD				—	.47*				—	.43*

* $P < .001$.

1 and supports the theory that offenders are “cafeteria”
 2 criminals rather than specialists and are likely to be
 3 involved in a variety of criminal behavior where there is
 4 opportunity (Gottfredson & Hirschi, 1990). There was no
 5 evidence of multicollinearity as there were no correla-
 6 tions above .70.

8 DISCUSSION

10 The aim of this study was to develop a self-report
 11 measure of violent and non-violent offending behavior
 12 which could be used by researchers to investigate the
 13 range of self-reported offending behavior in men and
 14 women in non-forensic populations. Five factors mea-
 15 suring violent and non-violent offending behavior in men
 16 and women were identified. These were: general
 17 violence, IPV, drug-related behavior, criminal damage,
 18 and theft. These categories are similar to the Home Office
 19 crime categories, which cover violent crime, acquisitive
 20 crime, vandalism/criminal damage, and drug offenses
 21 (Home Office, 2010). The NVOBS was shown to be
 22 psychometrically sound, with the resulting subscales
 23 having moderate to good internal consistency. Therefore,
 24 the NVOBS should be a useful instrument for measuring
 25 offending behavior in non-selected samples such as the
 26 ones used in the present study.

27 The new questionnaire distinguishes the components
 28 of offending, and allows for comparisons to be made
 29 between male and female offending. Examining sex
 30 differences in the NVOBS factors has provided support
 31 for previous research. We found that men self-reported
 32 more general violence than women: this was an expected
 33 finding, as a large body of research shows that, outside of
 34 intimate relationships, men are more violent than women,
 35 at every age and for various measures (Archer, 2004,
 36 2009; Eme, 2007, 2009, 2010; Moffitt et al., 2001). The
 37 finding that men are more generally violent than women
 38 fits with the sexual selection theory where intrasexual
 39 competition is motivated by status and resource acquisi-
 40 tion, and so sex differences should be most evident
 41 during young adulthood to correlate with the peak of
 42 reproductive competition (Daly & Wilson, 1988; Wilson
 43 & Daly, 1985). The current sample comprised predomi-
 44 nantly young adults as the mean age of the current sample
 45 was 22 years. Eme (2010) suggested that the sex
 46 difference in violent behavior occurs because men are
 47 more vulnerable than women to a “host of neuro-
 48 developmental risk factors that in interaction with family
 49 and environmental adversity exponentially increase the
 50 probability of violent behavior” (p. 486).

51 We also found that women were more violent than men
 52 within intimate relationships, which also supports a large
 53 body of evidence. Research using unselected samples
 54 (such as student samples) shows that women can be as

violent as men within intimate relationships, if not more
 so (Archer, 2000, 2002, 2006, 2012; Graham-Kevan &
 Archer, 2003; Thornton, Graham-Kevan, & Archer,
 2010). This finding has been found for both “minor”
 violence (e.g., pushing, slapping, hitting) as well as
 “severe” types of violence (Ehrensaft et al., 2004; Lussier
 et al., 2009; Straus, 2008), except for the items “beat up”
 and “choke” where the majority of the perpetrators were
 men (Archer, 2002), and women were the perpetrator in
 only about a third of cases. Research has shown that
 both men and women underreport their perpetration of
 IPV compared to reports about their partners, but this bias
 is more pronounced for men (Archer, 1999), leading
 to sex differences being slightly more in the female
 direction for perpetrators’ reports than for victims’
 reports (Archer, 2000).

Alternatively, the current findings may be related to
 male students having more to lose in terms of reputation
 by physically aggressing against their female partners: in
 a student sample, people live within close proximity of
 each other, so that any IPV is likely to be detected. Male
 IPV is not socially sanctioned in such groups, this makes
 it more likely female victims would seek helps and others
 would intervene on their behalf (Felson, 2002). There-
 fore, male students may have more to lose in a student
 sample than males in a community sample, and so they
 may inhibit their aggression towards their female
 partners, as the costs of not doing so are particularly
 high. Women’s IPV is not viewed as negatively as men’s
 and evokes less disapproval (Gerber, 1991), and
 therefore may attract less third party involvement.
 Men’s inhibition and the costs of IPV perpetration being
 lower for women than men may instead facilitate
 women’s violence towards her partner (George, 1994),
 which would result in less male perpetrators and more
 female perpetrators in a sample such as this.

We found that men perpetrated more non-violent
 offenses (drugs, criminal damage, and theft) than women,
 which supports existing research findings, such as those
 of Moffitt et al. (2001) and Steffensmeier and Allan
 (1996), who reported that men are generally more
 antisocial than women. The effect sizes were smallest for
 drug-related offenses, theft and criminal damage, and
 largest for IPV, and general violence, which is consistent
 with previous research (e.g., Moffitt et al., 2001; Smith &
 Visher, 1980^{Q5}). Recent research by Vaughn, Fu, et al.
 (2011) suggests that females are significantly more likely
 than males to abstain from engaging in the use of
 substances and from antisocial behavior, which is
 consistent with the current finding that men engage in
 significantly more non-violent and generally violent
 offenses than women. The sexual selection theory may
 also account for why men may be involved in more
 nonviolent crimes than women. Men may steal or

1 damage resources in order to outcompete rivals and
 2 increase the likelihood of their own access to females
 3 (Kanazawa & Still, 2000; Walsh, 2000).

4 The correlations revealed the interrelatedness of
 5 offending for men and women and showed that each
 6 offense, whether violent or nonviolent, was related to the
 7 perpetration of other offenses. All the results are
 8 consistent with previous research and theories which
 9 say that offenders are likely to be versatile, and unlikely
 10 to specialize in one particular type of crime (DeLisi &
 11 Piquero, 2011; Farrington et al., 2006; Gottfredson &
 12 Hirschi, 1990), particularly those classed as “the severe
 13 5%” of offenders who are versatile and are found to
 14 engage in high levels of the majority of antisocial and
 15 violent behavior (Vaughn, DeLisi, et al., 2011, p. 79). The
 16 results are also consistent with the conclusions of
 17 [Payne^{Q6}](#), Higgins, and Blackwell (2010, p. 1015) that
 18 “partner abusers should be viewed and treated as general
 19 types of criminals rather than specific types of offenders”
 20 because those who are violent within relationships are
 21 also more likely to be violent towards others in other
 22 settings. Altogether, the current findings demonstrate the
 23 close association between violent and nonviolent
 24 offending in men and women, and show that violent
 25 and nonviolent offending tend not to occur in isolation
 26 and instead form an interrelated set of complex
 27 behaviors. The interrelatedness between the five types
 28 of crime for men and women builds the case for
 29 measuring them together to assess their comorbidity,
 30 which is essential for extending our knowledge regarding
 31 the onset, development, and underlying mechanisms
 32 related to the different aspects of offending behavior in
 33 men and women.

34 Howard and Dixon (2011) developed a classification of
 35 violent offenses to be used to predict violent reoffending
 36 as part of the Offender Assessment System (OASys). To
 37 create this violence predictor, they examined a number of
 38 the main violence risk assessment instruments and found
 39 that there were 22 separate approaches for classifying
 40 criminal acts as either violent or non-violent. None of
 41 these classifications included drug offences or theft,
 42 which were assessed in the current study. Howard and
 43 Dixon (2011) concluded that “this lack of consensus on
 44 the classification of violent criminal behavior is an
 45 important issue for developers of new violence risk
 46 measures.” Therefore, their research has also identified a
 47 need for a comprehensive measure that classifies violent
 48 and non-violent offenses. The results from Howard and
 49 Dixon’s study have confirmed that violent and non-
 50 violent offenses overlap, as a history of criminal damage
 51 was found to predict future violent offending.

52 Studies such as the present one are limited in a number
 53 of ways. First, factor analysis itself has limitations. Factor
 54 analysis is a highly subjective procedure at a number of

stages. The judgments made throughout the analysis
 including deciding which analytic method to use, which
 rotation method to use, and how many factors or items to
 retain or omit at each stage. However, we countered these
 limitations by confirming the same results using an
 alternative rotation method which indicated a robust
 solution. We also used parallel analysis to identify the
 number of factors to retain. This has been shown to be a
 more accurate method than using either Kaiser’s
 Criterion or Cattell’s Scree plot alone (Hayton
 et al., 2004). Furthermore, there can be any number of
 solutions and the interpretation of the solution is left to
 the researcher. There are also no external criteria against
 which to assess the validity of the solution. However, our
 use of CFA to confirm the NVOBS factor structure
 addresses this limitation. Acknowledging the limitations,
 both factor analysis and CFA have been widely used in
 scale development and are deemed to be very useful
 evaluative methods.

A further potential limitation is that self-reports were
 used. Self-reports can be affected by socially desirable
 responding, and participants may deliberately distort
 their responses by underreporting violent and antisocial
 acts in order to minimize their involvement. This has
 been found to be the case in the area of partner violence,
 where both men and women underreport their perpetra-
 tion of IPV (Archer, 1999).

All participants in the current study were university
 students. Therefore, a non-student sample could also be
 used to establish norms and generalizability of the factor
 structure. Therefore, researchers using the NVOBS
 should report the internal consistency of the factors
 from their research samples. However, the university
 sample used in the current study has a reasonably wide
 demographic range and there is a great deal of research in
 this area that has used student samples (e.g., Fiebert &
 Gonzalez, 1997; Foo & Margolin, 1995; Nabors, 2010;
 Riggs & O’Leary, 1996; Straus, 2008; Straus &
 Ramirez, 2004; White & Koss, 1991), and therefore
 this scale will be of use in similar future research.

Furthermore, future research could assess additional
 psychometric properties of the measure, for example,
 test–retest reliability. Anonymity regarding participant
 responses precluded test–retest data being obtained
 during the current research, therefore, the current
 research is limited in that it is not clear how stable
 responses to the various NVOBS subscales are over time.
 Also, the measure should be used in alternative
 populations, such as prison and community samples, to
 examine whether the norms identified in the student
 sample are generalizable to other samples.

It was beyond the scope of the current study to include
 association with other scales, but further studies will
 include measures of validity (e.g., convergent,

discriminant) that are standard in validation papers, to evaluate the generalizability of the scale. For example, it is important to assess how responses to the five subscales relate to responses on widely used measures of trait aggression (e.g., Buss–Perry Aggression Questionnaire, Attitudes toward Violence Against Women) and other measures of IPV.

In conclusion, the questionnaire developed in this study is an improvement and extension of pre-existing measures because it is a comprehensive one that contains comparable questions for all three offense types (general violence, IPV, and non-violent offending), and uses the same response format throughout. The NVOBS appears to be a useful self-report measure of violent and non-violent offending with good psychometric properties.

Appendix 1: Instructions to participants

IPV

Sometimes conflict gets out of hand and physical fights occur. Couples have many different ways of trying to settle their differences. This is a list of things that might happen when you have differences. Please use the following scale to answer the questions below. Please read each statement carefully, and then circle the number that corresponds to how many times you did each of these in the last year, and how many times your partner did them in the last year. If your relationship did not last for the whole of the past year, please indicate how many times you and your partner did each of these during your whole relationship.

How often did this happen in the past year?

0 = This has never happened, 1 = Once in the past year, 2 = Twice in the past year, 3 = 3–5 times in the past year, 4 = 6–10 times in the past year, 5 = 11–20 times in the past year, 6 = More than 20 times in the past year.

General violence

Sometimes conflict gets out of hand and physical fights occur. Please answer the following questions in relation to **your** behavior. Please **do not** include fights you have had with a romantic partner (such as a boyfriend/girlfriend **as you have already been asked about this in [Introduction](#)**^{Q7} Section), only include fights with someone other than your partner, for example, friend, family member, stranger, etc.

Please use the following scale to answer the questions below. Please read each statement carefully, and then circle the number that corresponds to your reply.

How often did this happen in the past year?

0 = This has never happened, 1 = Once in the past year, 2 = Twice in the past year, 3 = 3–5 times in the past year, 4 = 6–10 times in the past year, 5 = 11–20 times in the past year, 6 = More than 20 times in the past year.

Non-violent offending

Please answer the following questions in relation to **your** behavior.

Please use the following scale to answer the questions below. Please read each statement carefully, and then circle the number that corresponds to your reply.

How often did this happen in the past year?

0 = This has never happened, 1 = Once in the past year, 2 = Twice in the past year, 3 = 3–5 times in the past year, 4 = 6–10 times in the past year, 5 = 11–20 times in the past year, 6 = More than 20 times in the past year.

Author Proof

AUTHOR QUERY FORM

JOURNAL: AGGRESSIVE BEHAVIOR

Article: ab21468

Dear Author,

During the copyediting of your paper, the following queries arose. Please respond to these by annotating your proofs with the necessary changes/additions using the E-annotation guidelines attached after the last page of this article.

We recommend that you provide additional clarification of answers to queries by entering your answers on the query sheet, in addition to the text mark-up.

Query No.	Query	Remark
Q1	Please provide the educational degrees of the corresponding author.	
Q2	Please check the insertion of the heading 'Introduction'.	
Q3	References Broidy et al., 2003 and Côté, Tremblay, Nagin, Zoccolillo, & Vitaro, 2002 have not been included in the Reference List, please supply full publication details.	
Q4	Hilbe, 2007 has not been included in the Reference List, please supply full publication details.	
Q5	Smith & Visher, 1980 has not been included in the Reference List, please supply full publication details.	
Q6	Payne, Higgins, and Blackwell (2010) has not been included in the Reference List, please supply full publication details.	
Q7	The headings are unnumbered hence Section 1 has been changed to Introduction Section, please check.	
Q8	Please provide the volume number and page range.	
Q9	Please cite the following references in the text or else delete them from the reference list: Capaldi and Crosby, 1997; Krueger et al., 1998; Pratt and Cullen, 2000; Straus, 1990.	
Q10	Please provide the publisher location.	

USING e-ANNOTATION TOOLS FOR ELECTRONIC PROOF CORRECTION

Required software to e-annotate PDFs: Adobe Acrobat Professional or Adobe Reader (version 8.0 or above). (Note that this document uses screenshots from Adobe Reader X)

The latest version of Acrobat Reader can be downloaded for free at: <http://get.adobe.com/reader/>

Once you have Acrobat Reader open on your computer, click on the Comment tab at the right of the toolbar:

This will open up a panel down the right side of the document. The majority of tools you will use for annotating your proof will be in the Annotations section, pictured opposite. We've picked out some of these tools below:

1. Replace (Ins) Tool – for replacing text.

Strikes a line through text and opens up a text box where replacement text can be entered.

How to use it

- Highlight a word or sentence.
- Click on the Replace (Ins) icon in the Annotations section.
- Type the replacement text into the blue box that appears.

standard framework for the analysis of microeconomics. Nevertheless, it also led to the emergence of strategic behavior in the number of competitors in an industry. This is that the structure of an industry, its main components, and the level, are exogenous to the industry. An important work on this by Shirasaka (henceforth) we open the 'black b

2. Strikethrough (Del) Tool – for deleting text.

Strikes a red line through text that is to be deleted.

How to use it

- Highlight a word or sentence.
- Click on the Strikethrough (Del) icon in the Annotations section.

there is no room for extra profits and the number of competitors are zero and the number of firms (net) values are not determined by the number of firms. Blanchard and ~~Kiyotaki~~ (1987), perfect competition in general equilibrium. The effects of aggregate demand and supply in the classical framework assuming monopoly power are an exogenous number of firms

3. Add note to text Tool – for highlighting a section to be changed to bold or italic.

Highlights text in yellow and opens up a text box where comments can be entered.

How to use it

- Highlight the relevant section of text.
- Click on the Add note to text icon in the Annotations section.
- Type instruction on what should be changed regarding the text into the yellow box that appears.

dynamic responses of mark-ups consistent with the VAR evidence

sation... y Ma... and... on n... to a... on... stent also with the demand-

4. Add sticky note Tool – for making notes at specific points in the text.

Marks a point in the proof where a comment needs to be highlighted.

How to use it

- Click on the Add sticky note icon in the Annotations section.
- Click at the point in the proof where the comment should be inserted.
- Type the comment into the yellow box that appears.

and supply shocks. Most of the... a... number... standard fra... cy. Nev... ole of str... ber of competitors and the imp... is that the structure of the secto

USING e-ANNOTATION TOOLS FOR ELECTRONIC PROOF CORRECTION

5. Attach File Tool – for inserting large amounts of text or replacement figures.

Inserts an icon linking to the attached file in the appropriate place in the text.

How to use it

- Click on the [Attach File](#) icon in the Annotations section.
- Click on the proof to where you'd like the attached file to be linked.
- Select the file to be attached from your computer or network.
- Select the colour and type of icon that will appear in the proof. Click OK.

6. Add stamp Tool – for approving a proof if no corrections are required.

Inserts a selected stamp onto an appropriate place in the proof.

How to use it

- Click on the [Add stamp](#) icon in the Annotations section.
- Select the stamp you want to use. (The [Approved](#) stamp is usually available directly in the menu that appears).
- Click on the proof where you'd like the stamp to appear. (Where a proof is to be approved as it is, this would normally be on the first page).

of the business cycle, starting with the
 on perfect competition, constant ret
 production. In this environment goods
 extra profits and the market for marke
 he market for goods is determined by the model. The New-Key
 otaki (1987), has introduced produc
 general equilibrium models with nomin
 and market-clearing. Most of this literat

7. Drawing Markups Tools – for drawing shapes, lines and freeform annotations on proofs and commenting on these marks.

Allows shapes, lines and freeform annotations to be drawn on proofs and for comment to be made on these marks..

How to use it

- Click on one of the shapes in the [Drawing Markups](#) section.
- Click on the proof at the relevant point and draw the selected shape with the cursor.
- To add a comment to the drawn shape, move the cursor over the shape until an arrowhead appears.
- Double click on the shape and type any text in the red box that appears.

For further information on how to annotate proofs, click on the [Help](#) menu to reveal a list of further options:

COLOR REPRODUCTION IN YOUR ARTICLE

Color figures were included with the final manuscript files that we received for your article. Because of the high cost of color printing, we can only print figures in color if authors cover the expense.

Please indicate if you would like your figures to be printed in color or black and white. Color images will be reproduced online in *Wiley Online Library* at no charge, whether or not you opt for color printing.

Failure to return this form will result in the publication of your figures in black and white.

COPYRIGHT TRANSFER AGREEMENT

Date: _____ Contributor name: _____

Contributor address: _____

Manuscript number (Editorial office only): _____

Re: Manuscript entitled _____

_____ (the "Contribution")

for publication in _____ (the "Journal")

published by _____ ("Wiley-Blackwell").

Dear Contributor(s):

Thank you for submitting your Contribution for publication. In order to expedite the editing and publishing process and enable Wiley-Blackwell to disseminate your Contribution to the fullest extent, we need to have this Copyright Transfer Agreement signed and returned as directed in the Journal's instructions for authors as soon as possible. If the Contribution is not accepted for publication, or if the Contribution is subsequently rejected, this Agreement shall be null and void. **Publication cannot proceed without a signed copy of this Agreement.**

A. COPYRIGHT

1. The Contributor assigns to Wiley-Blackwell, during the full term of copyright and any extensions or renewals, all copyright in and to the Contribution, and all rights therein, including but not limited to the right to publish, republish, transmit, sell, distribute and otherwise use the Contribution in whole or in part in electronic and print editions of the Journal and in derivative works throughout the world, in all languages and in all media of expression now known or later developed, and to license or permit others to do so.

2. Reproduction, posting, transmission or other distribution or use of the final Contribution in whole or in part in any medium by the Contributor as permitted by this Agreement requires a citation to the Journal and an appropriate credit to Wiley-Blackwell as Publisher, and/or the Society if applicable, suitable in form and content as follows: (Title of Article, Author, Journal Title and Volume/Issue, Copyright © [year], copyright owner as specified in the Journal). Links to the final article on Wiley-Blackwell's website are encouraged where appropriate.

B. RETAINED RIGHTS

Notwithstanding the above, the Contributor or, if applicable, the Contributor's Employer, retains all proprietary rights other than copyright, such as patent rights, in any process, procedure or article of manufacture described in the Contribution.

C. PERMITTED USES BY CONTRIBUTOR

1. **Submitted Version.** Wiley-Blackwell licenses back the following rights to the Contributor in the version of the Contribution as originally submitted for publication:

a. After publication of the final article, the right to self-archive on the Contributor's personal website or in the Contributor's institution's/employer's institutional repository or archive. This right extends to both intranets and the Internet. The Contributor may not update the submission version or replace it with the published Contribution. The version posted must contain a legend as follows: This is the pre-peer reviewed version of the following article: FULL CITE, which has been published in final form at [Link to final article].

b. The right to transmit, print and share copies with colleagues.

2. **Accepted Version.** Re-use of the accepted and peer-reviewed (but not final) version of the Contribution shall be by separate agreement with Wiley-Blackwell. Wiley-Blackwell has agreements with certain funding agencies governing reuse of this version. The details of those relationships, and other offerings allowing open web use, are set forth at the following website: <http://www.wiley.com/go/funderstatement>. NIH grantees should check the box at the bottom of this document.

3. **Final Published Version.** Wiley-Blackwell hereby licenses back to the Contributor the following rights with respect to the final published version of the Contribution:

a. Copies for colleagues. The personal right of the Contributor only to send or transmit individual copies of the final published version in any format to colleagues upon their specific request provided no fee is charged, and further-provided that there is no systematic distribution of the Contribution, e.g. posting on a listserve, website or automated delivery.

b. Re-use in other publications. The right to re-use the final Contribution or parts thereof for any publication authored or edited by the Contributor (excluding journal articles) where such re-used material constitutes less than half of the total material in such publication. In such case, any modifications should be accurately noted.

c. Teaching duties. The right to include the Contribution in teaching or training duties at the Contributor's institution/place of employment including in course packs, e-reserves, presentation at professional conferences, in-house training, or distance learning. The Contribution may not be used in seminars outside of normal teaching obligations (e.g. commercial seminars). Electronic posting of the final published version in connection with teaching/training at the Contributor's institution/place of employment is permitted subject to the implementation of reasonable access control mechanisms, such as user name and password. Posting the final published version on the open Internet is not permitted.

d. Oral presentations. The right to make oral presentations based on the Contribution.

4. **Article Abstracts, Figures, Tables, Data Sets, Artwork and Selected Text (up to 250 words).**

a. Contributors may re-use unmodified abstracts for any non-commercial purpose. For on-line uses of the abstracts, Wiley-Blackwell encourages but does not require linking back to the final published versions.

b. Contributors may re-use figures, tables, data sets, artwork, and selected text up to 250 words from their Contributions, provided the following conditions are met:

- (i) Full and accurate credit must be given to the Contribution.
- (ii) Modifications to the figures, tables and data must be noted. Otherwise, no changes may be made.
- (iii) The reuse may not be made for direct commercial purposes, or for financial consideration to the Contributor.
- (iv) Nothing herein shall permit dual publication in violation of journal ethical practices.

D. CONTRIBUTIONS OWNED BY EMPLOYER

1. If the Contribution was written by the Contributor in the course of the Contributor's employment (as a "work-made-for-hire" in the course of employment), the Contribution is owned by the company/employer which must sign this Agreement (in addition to the Contributor's signature) in the space provided below. In such case, the company/employer hereby assigns to Wiley-Blackwell, during the full term of copyright, all copyright in and to the Contribution for the full term of copyright throughout the world as specified in paragraph A above.

2. In addition to the rights specified as retained in paragraph B above and the rights granted back to the Contributor pursuant to paragraph C above, Wiley-Blackwell hereby grants back, without charge, to such company/employer, its subsidiaries and divisions, the right to make copies of and distribute the final published Contribution internally in print format or electronically on the Company's internal network. Copies so used may not be resold or distributed externally. However the company/employer may include information and text from the Contribution as part of an information package included with software or other products offered for sale or license or included in patent applications. Posting of the final published Contribution by the institution on a public access website may only be done with Wiley-Blackwell's written permission, and payment of any applicable fee(s). Also, upon payment of Wiley-Blackwell's reprint fee, the institution may distribute print copies of the published Contribution externally.

E. GOVERNMENT CONTRACTS

In the case of a Contribution prepared under U.S. Government contract or grant, the U.S. Government may reproduce, without charge, all or portions of the Contribution and may authorize others to do so, for official U.S. Govern-

ment purposes only, if the U.S. Government contract or grant so requires. (U.S. Government, U.K. Government, and other government employees: see notes at end)

F. COPYRIGHT NOTICE

The Contributor and the company/employer agree that any and all copies of the final published version of the Contribution or any part thereof distributed or posted by them in print or electronic format as permitted herein will include the notice of copyright as stipulated in the Journal and a full citation to the Journal as published by Wiley-Blackwell.

G. CONTRIBUTOR'S REPRESENTATIONS

The Contributor represents that the Contribution is the Contributor's original work, all individuals identified as Contributors actually contributed to the Contribution, and all individuals who contributed are included. If the Contribution was prepared jointly, the Contributor agrees to inform the co-Contributors of the terms of this Agreement and to obtain their signature to this Agreement or their written permission to sign on their behalf. The Contribution is submitted only to this Journal and has not been published before. (If excerpts from copyrighted works owned by third parties are included, the Contributor will obtain written permission from the copyright owners for all uses as set forth in Wiley-Blackwell's permissions form or in the Journal's Instructions for Contributors, and show credit to the sources in the Contribution.) The Contributor also warrants that the Contribution contains no libelous or unlawful statements, does not infringe upon the rights (including without limitation the copyright, patent or trademark rights) or the privacy of others, or contain material or instructions that might cause harm or injury.

U.S. Government work

Note to U.S. Government Employees

A contribution prepared by a U.S. federal government employee as part of the employee's official duties, or which is an official U.S. Government publication, is called a "U.S. Government work," and is in the public domain in the United States. In such case, the employee may cross out Paragraph A.1 but must sign (in the Contributor's signature line) and return this Agreement. If the Contribution was not prepared as part of the employee's duties or is not an official U.S. Government publication, it is not a U.S. Government work.

U.K. Government work
(Crown Copyright)

Note to U.K. Government Employees

The rights in a Contribution prepared by an employee of a U.K. government department, agency or other Crown body as part of his/her official duties, or which is an official government publication, belong to the Crown. U.K. government authors should submit a signed declaration form together with this Agreement. The form can be obtained via <http://www.opsi.gov.uk/advice/crown-copyright/copyright-guidance/publication-of-articles-written-by-ministers-and-civil-servants.htm>

Other Government work

Note to Non-U.S., Non-U.K. Government Employees

If your status as a government employee legally prevents you from signing this Agreement, please contact the editorial office.

NIH Grantees

Note to NIH Grantees

Pursuant to NIH mandate, Wiley-Blackwell will post the accepted version of Contributions authored by NIH grant-holders to PubMed Central upon acceptance. This accepted version will be made publicly available 12 months after publication. For further information, see www.wiley.com/go/nihmandate.
