

The Hydrological Summary for the UK National Hydrological Monitoring Programme

Reporting of UK hydrological conditions is of paramount importance during extreme flood and drought episodes¹. The Hydrological Summary provides an authoritative and informative commentary on the severity and spatial extent of hydrological extremes and the current water resource situation. Starting in 1988, this monthly report describes the preceding month's conditions, and placing them in a long-term context. It's audience includes academia, consultants, regulators, the water industry, policy makers and the media, as well as appealing to wider public interest. The National Hydrological Monitoring Programme has a particular obligation to document contemporary hydrological conditions through the Summary and in occasional reports on events of major significance.

Hydrological Summary for the United Kingdom Left & Below: Feb 1990. Right & Trent at Colwick Above: Mar 2016. Groundwater

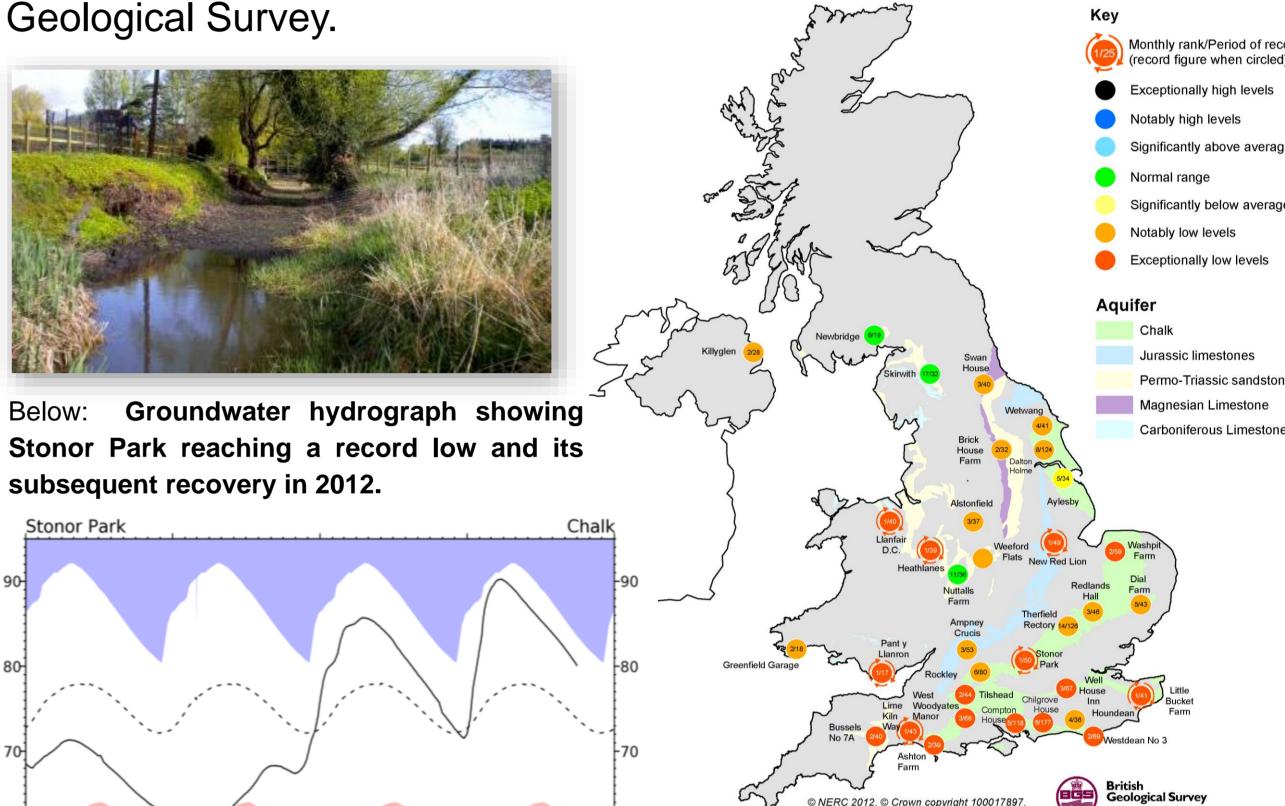

Rainfall and Soil Moisture

- Rainfall data are provided by the Met Office National Climate Information Centre (NCIC).
- Based on 5km resolution gridded data² from rain gauges and extends back to 1910.
- Rainfall accumulations derived from the monthly areal with periods series return calculated to place events in longterm context.
- Soil moisture deficits from the Met Office Rainfall and Evaporation Calculation System (MORECS) are averaged over 40 x 40km grid squares, in records extending back to 1961³.

Below: MORECS Soil Moisture Below: August 2015 rainfall as % of **Deficits August 2015.** 1971-2000 Average. SMD (mm)

 Collation of data from 33 boreholes, and groundwater commentaries, complied and composed by the British

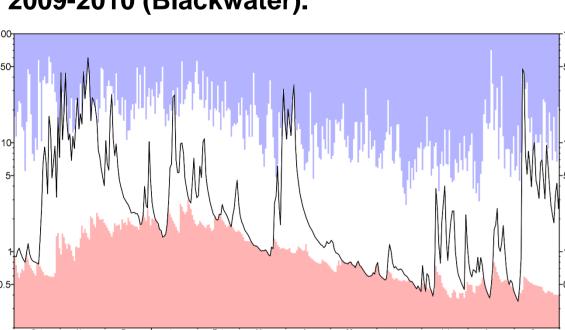

Below: Groundwater Levels in the 2010-2012 Drought - March 2012.

River Flow

- Flows from 105 rivers are used to produce, hydrographs, monthly and accumulated 'spot-maps'.
- Analysis determines maximum or minimum records have been registered.
- Flows are combined to produce national and regional outflows, to help characterise contemporary runoff and water resource variability⁴.

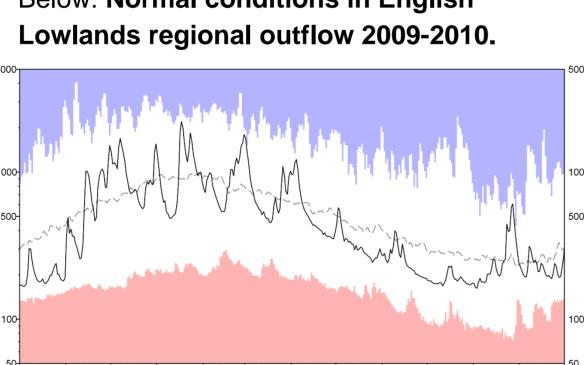

Below: Flood events in Northern Ireland 2009-2010 (Blackwater).

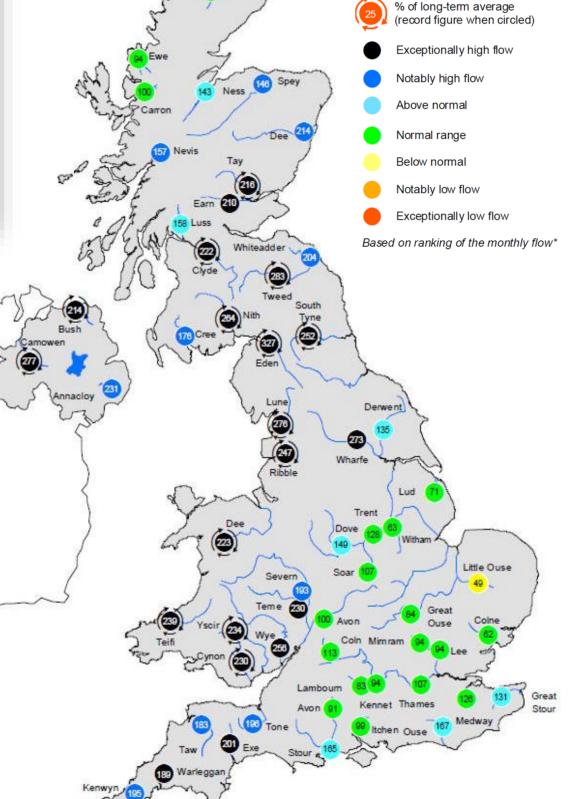

Below: November 2009 flooding in Northern Ireland.

Below: Normal conditions in English

Below: November 2009 flows show large contrast between the English Lowlands and the rest of the UK.

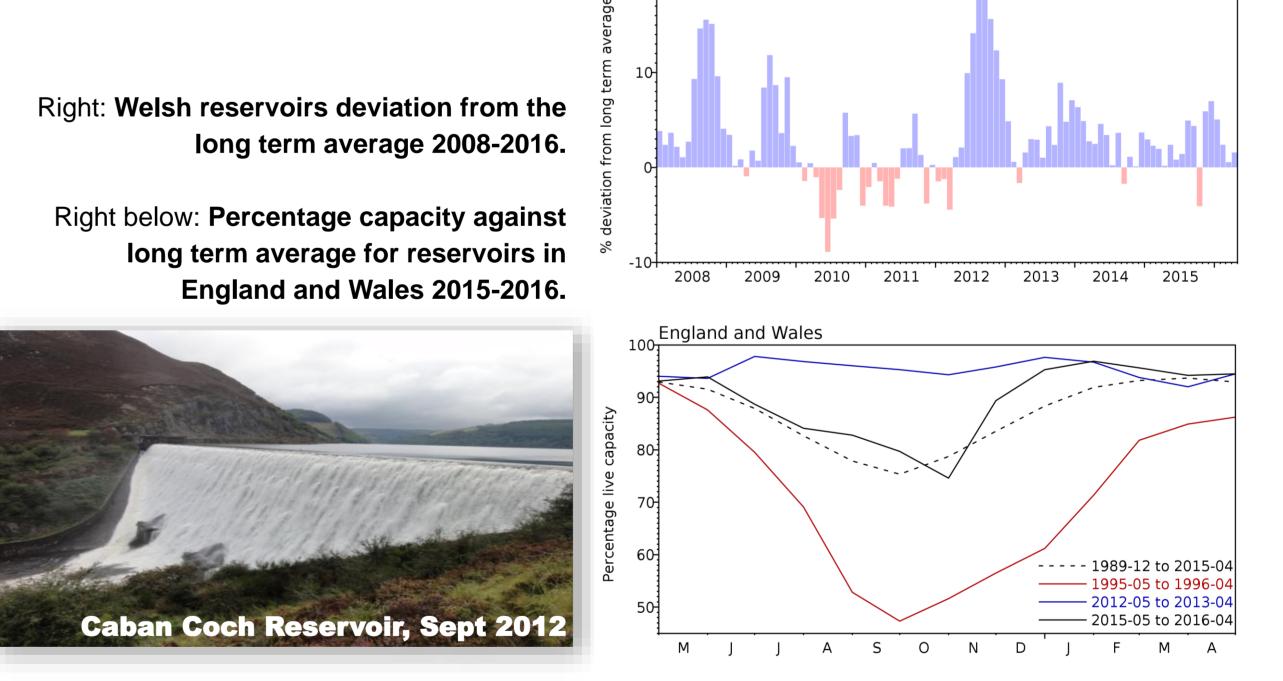

Reservoirs

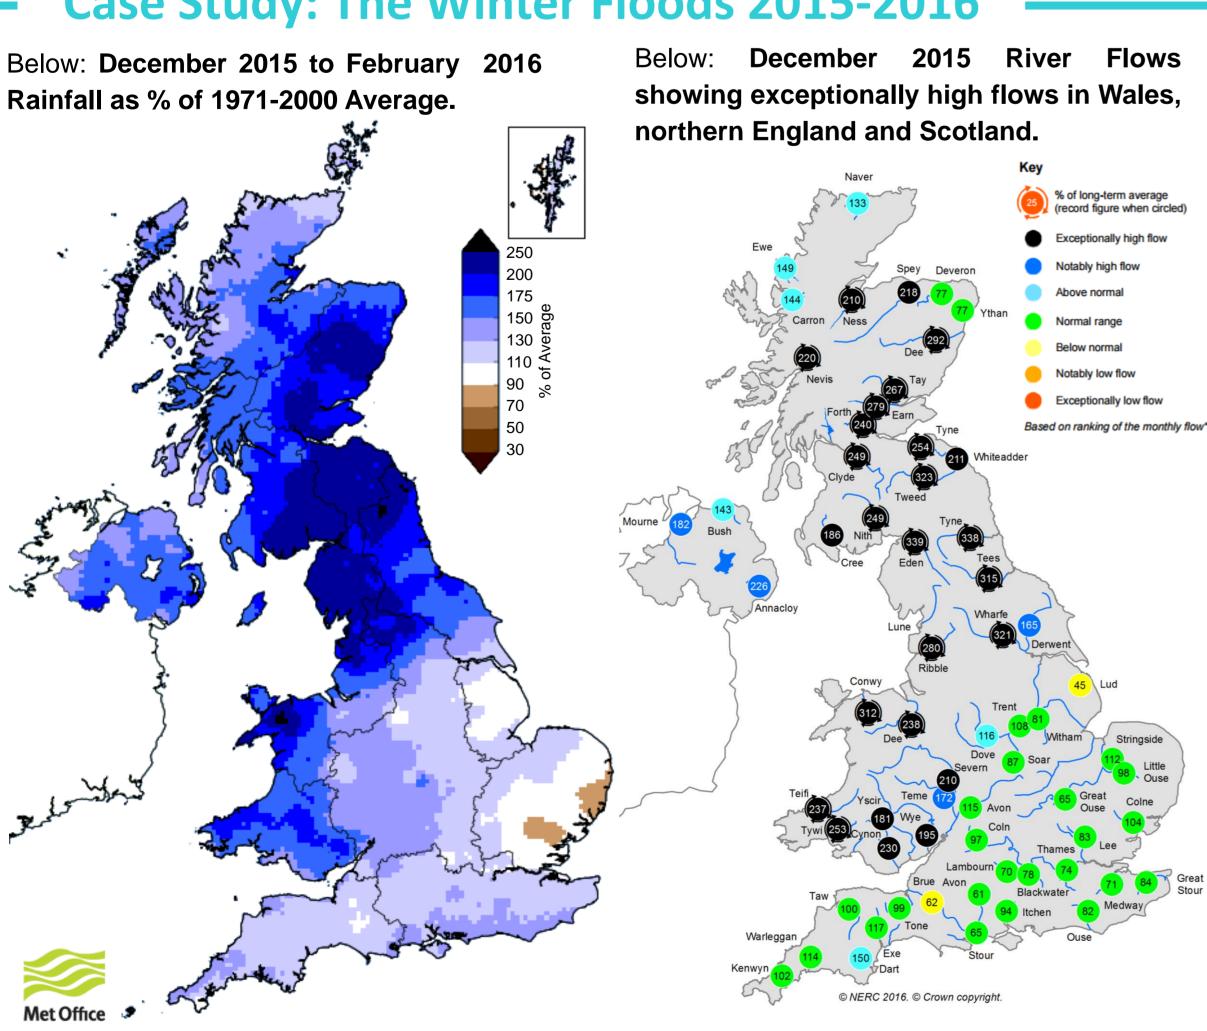

Reservoir stocks are provided by the water companies and the EA.

2013 2014 Period of record: 1961-2014

- The percentage capacity of reservoir stocks are compared to long term averages, and is displayed for regions and individual reservoirs.
- Deviation from the long term average highlights current water resources situation.

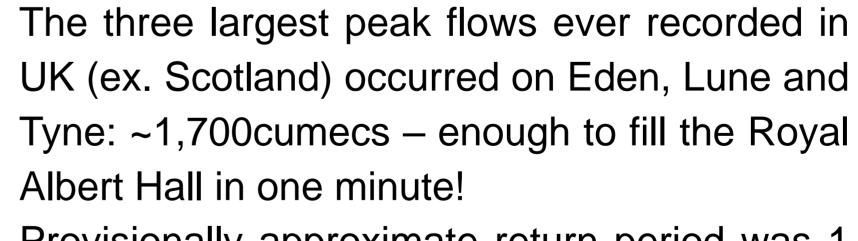

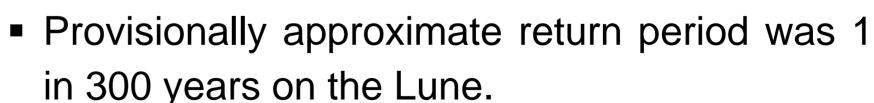

Case Study: The Winter Floods 2015-2016

- Cumbria, Dec 2015
- adcaster Bridge, Dec 2015
- GB outflow highlights the widespread nature of the December 2015 event as well as the magnitude.

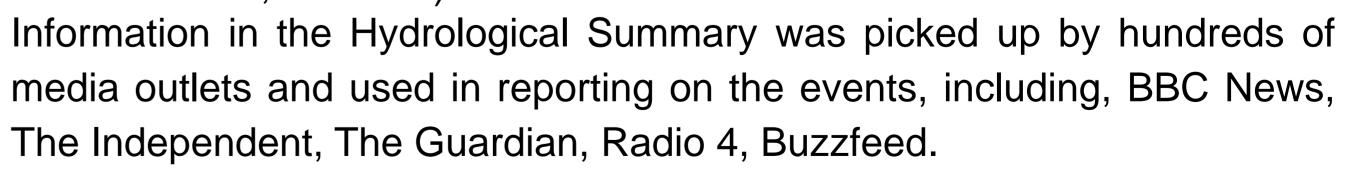

Right: Great Britain national outflows from March 2015-April 2016 showing winter events.

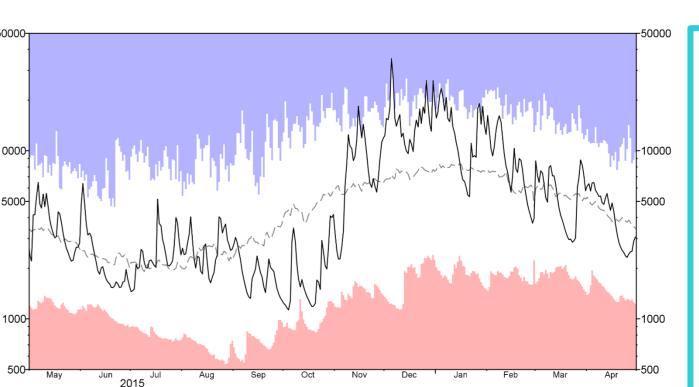

New 24-hour UK rainfall record (341.4mm at

Honister Pass, Cumbria).
