We have generated induced pluripotent stem 29 cells (iPSCs) from 24 people from the Lothian Birth Cohort 1936, whose cognitive ability was tested in 30 childhood and in older age. Peripheral blood mononuclear cells (PBMCs) were reprogrammed using non-31 integrating oriP/EBNA1 backbone plasmids expressing six iPSC reprogramming factors (OCT3/4 (POU5F1), 32 SOX2, KLF4, L-Myc, shp53, Lin28, SV40LT). All lines demonstrated STR matched karyotype and pluripotency 33 was validated by multiple methods. These iPSC lines are a valuable resource to study molecular mechanisms 34 underlying individual differences in cognitive ageing and resilience to age-related neurodegenerative diseases.

2 **Resource utility**

3 The neurobiology of cognitive ability and its decline during ageing are poorly understood. Human iPSC lines

4 from the Lothian Birth Cohort 1936 comprise individuals with rich life-course cognitive performance data

1	<mark>(Taylor et al., 2018; Wardlaw et al., 2011)</mark> , affording a rare model to investigate molecular mechanisms
2	relevant to differences in brain development, cellular resilience, and vulnerability to pathology.
3	
4	Resource Details
5	
6	Human peripheral blood mononuclear cells (PBMCs) were obtained from 24 unrelated members of the
7	Lothian Birth Cohort 1936. Demographic parameters are 50% female (n = 12), 100% white Scottish (Table 1).
8	Line donors can be grouped into 'successful', 'typical', and 'poor' cognitive ageing categories (sFig.1). Exclusion
9	criteria were: self-reported dementia, Parkinson's disease or stroke, Mini Mental State Examination (MMSE
10	score <24, as well as standardised childhood IQ scores (<65, Moray House Test No. 12 at age 11), and
11	standardised adult IQ scores (<85, average of Moray House Test No. 12 at age 70 and 76).
12	
13	PBMCs were reprogrammed to generate induced pluripotent stem cells (iPSCs) using episomal plasmids
14	encoding human OCT3/4 (POU5F1), SOX2, KLF4, L-Myc, shp53, Lin28, SV40LT. All lines were reprogrammed
15	and stored within 22 months of each other. EBNA-related gene analysis demonstrated that iPSCs were EBNA
16	transgene-free (and therefore exogenous reprogramming factors were no longer present) by passage 17-21
17	(depending on line). Qualitative tests for parental cell type by TCR- $lphaeta$ and TCR- $\gamma\delta$ T-cell clonality assay
18	revealed that 83% (n = 20) of lines were non-T cell-derived, 17% (n = 4) were T-cell derived. T-cell derived lines
19	are: EDi021-A, EDi025-A, EDi026-A, and EDi035-A. All lines have been confirmed mycoplasma negative
20	(sFig.27).
21	
22	All lines demonstrated stem cell-like morphology (Fig1F, sFig2-24F) and expressed six pluripotency markers
23	(OCT3/4, NANOG, SOX2, TRA-1-60, TRA-1-81, SSEA4) evaluated by immunocytochemistry (Fig.1B, sFig.2-24B).
24	Additionally, all lines demonstrated positive alkaline phosphatase AP staining (Fig.1A, sFig.2-24A) and self-
25	renewal in undifferentiated iPSCs as assessed by PluriTest (Fig.1C, sFig.2-24C) and TaqMan®hPSC Scorecard [™]
26	Panel (Fig.1D, sFig.2-24E). However, whilst EDi035-A had a positive PluriTest and Scorecard [™] pluripotency
27	result, the PluriTest novelty score was borderline (1.688) (sFig.14C,E). Furthermore, EDi027-A also had a
28	borderline positive ectoderm score as assessed by Scorecard [™] (sFig.6E). At 14 days of embryoid body
29	differentiation, all lines demonstrated tri-lineage potential except EDi022-A (negative endoderm, borderline
30	mesoderm score, sFig.2E), EDi035-A (negative mesoderm, borderline endoderm score, sFig.14E), and EDi042-A
31	(negative endoderm score, sFig.21E), as assessed by Scorecard [™] .
32	
33	All lines showed a normal karyotype (Fig.1D, sFig. 2-24D) between passages 6-22, with one exception. All five
34	clones of EDi-038-A (a male) karyotyped as monosomy (45,X) (sFig.18D), and thus very likely stems from the
35	source PBMCs. Mosaicism is a relatively common and probably harmless finding in blood cultures from normal

1	females and, though rarer, also in males (Bukvic et al., 2001). No differences were detected between the
2	original PBMC samples and the corresponding iPSC lines.
3	
4	All lines were confirmed to be of human origin and iPSCs matched the profile of parent PBMCs by Short
5	Tandem Repeat (STR) analysis. Parent line data was not available for EDi026-A and EDi028-A. Genetic profiles
6	for these lines were compared to the cell line genetic profiles available in the DSMZ STR database and did not
7	match any other reported profiles in the DSMZ database. These profiles were found to be unique and did not
8	match to any previously submitted profiles from the iPSC Core. The genetic profiles established here can be
9	used for future comparisons for these cell lines. Whole genome sequence data for all 24 lines has been
10	deposited at the European Genome-phenome Archive (EGA), which is hosted by the EBI and the CRG, under
11	accession number EGAS00001003819.
12	
13	An overview of iPSC line characterisation can be found in Table 2. Figure 1 presents example characterisation
14	<mark>data from EDi021-A</mark> . Data for all other lines can be found in Supplementary Figures 2- <mark>27</mark> .
15	
16	Materials and Methods
17	
18	PBMC isolation
19	Blood samples were collected with NHS Lothian Research Ethics Committee Approval (10/S1103/10). Blood
20	samples were collected in Sodium Citrate BD Vacutainer CPT tubes (BD, Cat. 362761) (three tubes per
21	participant). For samples EDi021-A, EDi025-A, EDi028-A, EDi030-A, EDi031-A, EDi032-A, EDi033-A, EDi034-A,
22	and EDi035-A PBMC isolation was performed by Roslin Cells. For all other lines, PBMC isolation was performed
23	by the Edinburgh Clinical Research Facility (ECRF).
24	
25	Generation of human iPSCs
26	Generation of human iPSCs lines from PBMCs was performed using nucleofection of episomal plasmids
27	containing POU5F1, SOX2, KLF4, LIN28, L-MYC, TP53shRNA, and SV40LT.
28	
29	Briefly, ~5×10 ⁶ cells per nucleofection of PBMCs were nucleofected with the Amaxa Human T-cell
30	Nucleofector [®] Kit (Lonza, Cat. VVPA-1002) and a 5p plasmid mixture <mark>using program V-024</mark> on a Amaxa
31	Nucleofector 2D Device <mark>(Lonza, Cat. AAB-1001).</mark> Each transfection contained the following seven factors:
32	OCT4, SOX2, KLF4, LMYC, LIN28, SV40LT and p53 shRNA. These were delivered on the following plasmids from
33	Addgene, together with an EBNA1 plasmid for episomal plasmid maintenance: pEP4 E02S ET2K <mark>(Cat. 20927)</mark> ,
34	pCXLE-hOCT3/4-shp53-F <mark>(Cat. 27077)</mark> , pCXLEhUL <mark>(Cat. 27080)</mark> , pCXLE-hSK <mark>(Cat. 27078)</mark> , and pCXWB-EBNA1
35	(Cat. 37624). Each transfection used 0.5μg of plasmid pCXWB-EBNA1 and 0.83μg of each of the remaining four
36	plasmids. After nucleofection, cells were immediately plated in either $\alpha\beta$ T-cell medium (X-vivo10 [Lonza, Cat.

- 1 04-380Q] supplemented with 30U/ml IL-2 [ThermoFisher Scientific, Cat. PHC0026] and 5µl/well Dynabeads
- 2 Human T-activator CD3/CD28 [Life Technologies, Cat. 11161D]) or non T-cell medium (αMEM [Life
- 3 Technologies, Cat. 12561056] supplemented with 10% Heat Inactivated-FBS [Life Technologies, Cat.
- 4 10437028], 10ng/ml IL-3 [StemCell Technologies, Cat. 78040.1], 10ng/ml IL-6 [StemCell Technologies, Cat.
- 5 78050.1], 10ng/ml G-CSF [StemCell Technologies, Cat. 78012.1] and 10ng/ml GM-CSF [StemCell Technologies,
- 6 Cat. 78015.1]) onto mitomycin treated mouse embryonic fibroblasts (MEF) and placed in a 37°C incubator
- 7 with 20% O2 and 5% CO2.
- 8
- 9 Two days after nucleofection, 2mL/well of Primate ESC medium (ReproCell, Cat. RCHEMD001) containing 10 5ng/ml bFGF (for MEF condition) was added to the wells without aspirating the previous medium. Beginning 11 on day four, the medium was gently aspirated from each well and 2mL of the appropriate fresh 12 reprogramming media was added to each well. Medium was replaced every other day. At approximately day 13 18 post nucleofection, individual colonies were observed in all wells of each condition. Individual PBMC-iPSC colonies with ES/iPSC-like morphology appeared between day 25-32 and those with best morphology were 14 15 mechanically isolated, transferred onto 12-well plates with fresh Matrigel™ Matrix (Corning/BD Biosciences, Cat. 354230), and maintained in mTeSR[®]1 medium (StemCell Technologies, Cat. 85850). The iPSC clones were 16 17 further expanded and scaled up for further analysis. All cultures were maintained at 37°C, 20% O₂, and 5% CO₂ 18 throughout the reprogramming process.
- 19

20 *iPSC maintenance and storage*

- Human iPSCs were cultured in mTeSR[®]1 medium (StemCell Technologies, Cat. 85850) on growth factor-21 22 reduced Matrigel[™] Matrix (Corning, Cat. 354230) -coated plates at 37°C in a 20% O₂, 5% CO₂ incubator. Briefly, 23 70–90% confluent human iPSC colonies were passaged every 7 days chemically (Versene, Life Technologies, 24 Cat. 15040-066 or ReLeSR, StemCell Technologies, Cat. 05872) or mechanically by StemPro® EZPassage™ Disposable Stem Cell Passaging Tool (Life Technologies, Cat. 23181-010) and re-plated at a 1:6 or 1:9 ratio 25 26 depending on the cell line. The iPSCs were passaged every 5-7 days. The iPSCs were expanded for 6-22 27 passages during which period various characterization assays were performed. The iPSCs were cryopreserved 28 using CryoStor CS10 (StemCell Technologies, Cat. 07930) and an isopropanol freezing vessel at -80°C 29 overnight. The cryopreserved vials were subsequently stored in liquid nitrogen tanks for long-term storage. 30 Working Cell Banks (WCB) of iPSCs were cryopreserved at passage 9-14 and then Distribution Cells Banks 31 (DCB) were created between passages 18-22.
- 32

33 Mycoplasma testing

The absence of mycoplasma contamination in the iPSC lines were confirmed monthly using the MycoAlert
 Detection Kit, a selective biochemical test (LONZA, Cat. LT07-1188).

1 EBNA-related gene analysis

- 2 250ng of genomic DNA was extracted using the KingFisherTM DUO Prime purification system (Thermo Fisher
- 3 Scientific) and the MagMAXTM DNA Multi-Sample Ultra 2.0 Kit (Applied Biosystems, A36570). An embryonic
- 4 stem cell line (H9) was included alongside LBC lines a negative control. DNA Amplification was conducted
- 5 using TaKaRa Ex Taq[®] DNA Polymerase (TaKaRa Bio, RR001) and a Bio Rad 1000 Touch Thermal Cycler.
- 6 Primers that recognize EBNA1 along with housekeeping gene Glyceraldehyde 3-phosphate dehydrogenase
- 7 (GAPDH), which was used as a housekeeping gene, were included in this study (Table 2). PCR was run for 35
- 8 cycles at 95°C for 30 seconds, 60°C for 30 seconds, and 72°C for 30 seconds.
- 9

10 TCRB and TCRG T-Cell Clonality Assay

- TCRB and TCRG T-Cell Clonality testing was conducted using Gene Rearrangement and Translocation assays
 from Invivoscribe Technologies, Inc. Genomic DNA was harvested from all iPSC lines using the MagMAX[™] DNA
 Multi-Sample Ultra 2.0 Kit (Cat. A36570) from Applied Biosystems and it was re-suspended to a final
 concentration of 100-400µg per ml in dilution buffer. Three Clonal Control DNA and one Polyclonal Control
 DNA provided with the kit were used. PCR was carried out as per the manufacturer's protocol. PCR products
 were analysed using 6% TBE gel electrophoresis with gel red staining.
- 17

18 Karyotyping

- 19 Human PBMC-iPSCs were incubated in Colcemid (100ng/mL; Life Technologies) for 30 minutes at 37°C and 20 then dissociated using TrypLE for 5 minutes. They were then washed in phosphate buffered saline (PBS) and 21 incubated at 37°C in 5mL hypotonic solution (1g KCl, 1g Na Citrate in 400mL water) for 30 minutes. The cells 22 were centrifuged for 2.5 minutes at 1500RPM and re-suspended in fixative (methanol: acetic acid, 3:1) at room temperature for 5 minutes. This was repeated twice, and finally cells were re-suspended in 500µl of 23 24 fixative solution and submitted to the Cedars-Sinai Clinical Cytogenetics Core for G-band karyotyping. 25 Karyotyping of each iPSC line was conducted at early and late passage, between passages 6-22. Approximately 20 metaphase spreads were counted per line. 26
- 27

28 Immunocytochemistry

iPSCs were plated on Matrigel[™] (Corning, Cat. 354230) -coated glass coverslips or optical-bottom 96-well 29 30 plates (ThermoFisher Scientific, Cat. 165305) and subsequently fixed in 4% paraformaldehyde (10 minutes, room temperature (RT)). The blocking buffer used was <mark>5%</mark> goat serum (Millipore, Cat. S26-100ML) and 5% 31 32 donkey serum (Millipore, S30-100ML) with 0.15% Triton X-100 in PBS, except for SSEA4 and OCT4 staining, for 33 which 5% goat serum with 0.15% Triton X-100 in PBS was used as the block. All cells were blocked for one 34 hour at RT, then incubated with primary antibodies (Table 3) for either 3 hours at RT or overnight at 4°C. Cells 35 were then rinsed and incubated in species-specific AF488 or AF594-conjugated secondary antibodies (1:500, diluted in the same block as the primary antibodies) for one hour at RT, followed by DAPI (0.5-1µg/ml; Sigma) 36

- 1 to counterstain nuclei (10 minutes, RT). Cells were imaged using Nikon/Leica microscopes or Image Express.
- 2 The iPSCs exhibited an embryonic stem cell like morphology, and expressed a range of pluripotency markers
- 3 (OCT3/4, NANOG, SOX2, TRA-1-60, TRA-1-81, SSEA4) (Figure 1B, Supplementary Figures 2-24B).
- 4

5 Alkaline phosphatase staining

Alkaline phosphatase staining was performed using the Alkaline Phosphatase Staining Kit II (Stemgent, Cat. 000055) according to the manufacturer's instructions.

8

9 PluriTest

10 PluriTest was used to assess the pluripotency of undifferentiated iPSCs (Figure 1C, Supplementary Figures 2-11 24C). Cell pellets were sent to Life Technologies Corporation for the PluriTest Service. Total RNA was isolated 12 using the PureLinkTM RNA Mini Kit (Thermo Fisher Scientific) and quantified using NanoDropTM. 100ng total RNA was used to prepare the GeneChip[®] for the PluriTest[™]. In this assay, 36,000 transcripts and variants 13 14 against a >450 sample reference set are assessed for gene expression analysis. A non-iPSC sample was used in this experiment to serve as a control for non-pluripotency. The transcriptome of all samples were analysed 15 16 and processed in the PluriTest[™] algorithm to generate a pluripotency and novelty score. These two scores determine the pluripotency signature of the cell line which is represented in the pluripotency plot. The 17 18 threshold for pluripotency was >20, and the threshold for novelty was <1.6.

19

20 hPSC Scorecard Data Analysis

Applied Biosystems TaqMan[®]hPSC Scorecard[™] Panel (Thermo Fisher Scientific) was used as an additional 21 22 technique to assess pluripotency and tri-lineage differentiation potential of iPSC lines using real-time qPCR assays (Figure 1E, Supplementary Figures 2-24E). Total RNA from undifferentiated and EB differentiated iPSC 23 lines was isolated using MagMAX[™] mirVana[™] Total RNA Isolation Kit (A27828), and 1µg of RNA was used to 24 25 make cDNA using the High Capacity cDNA Reverse Transcription Kit (4368813), both from Applied Biosystems. 26 TaqMan qRT-PCR was carried out using the hPSC Scorecard 384w Fast plate (Life technologies, A15870) and 27 QuantStudio 12k Flex, following manufacturer protocol. We analysed the gene expression data from the TaqMan[®]hPSC Scorecard[™] Panel using the web-based hPSC Scorecard[™] Analysis Software (Thermo Fisher 28 Scientific). 29

30

31 Embryoid Body (EB) Formation

32 IPSC lines were allowed to differentiate by EB formation. Briefly, iPSCs were lifted from 3 wells of a 6 well
33 plate using a cell scraper and seeded in a T25 flask treated with poly-HEMA to prevent cell attachment in EB
34 media containing: IMDM basal media (Cat. 12440061), 17% KnockOut Serum Replacement (KOSR; Cat.
35 10828028), 1% non-essential amino acids (Cat. 11140050), 1% Antibiotic-Antimycotic (Cat. 15240062) and
36 110µM β-Mercaptoethanol (Cat. 21985023), all from Thermo Fisher. EBs were allowed to form by self-

1 aggregation, grow and differentiate for 14 days in EB culture media replacing it twice a week. Differentiation

2 to endoderm, mesoderm and ectoderm was assessed by TaqMan[®] hPSC Scorecard[™] Assay (Figure 1E,

- 3 Supplementary Figures 2-24E).
- 4
- 5

6 STR Analysis

Short Tandem Repeat (STR) Analysis is conducted to confirm iPSC genetic identity. For that, a frozen vial of the parent PBMCs and a frozen vial of the reprogramed iPSC line at late passage (18-21, depending on the cell
line) are sent to IDEXX BioResearch. STR profile and interspecies contamination testing is analysed. iPSC line
human authentication was conducted at IDEXX BioResearch by Cell Check[™]. Profiling included using a nine
marker STR profile (AMEL, CSF1PO, D13S317, D16S539, D5S818, D7S820, TH01, TPOX and vWA) and
interspecies contamination check for human, mouse, rat, African green monkey and Chinese hamster cells.

- 13 Comparative analysis was conducted between parent PBMCs and reprogrammed iPSC lines.

31 Acknowledgements

32 We thank the LBC1936 participants who took part in this study, and gratefully acknowledge the contribution of

the late Professor John M. Starr, who was the Lothian Birth Cohort 1936's research medical doctor from its

34 beginning in 2004 until 2018. Additionally, we would like to thank the Edinburgh Clinical Research Facility

35 nursing staff, Roslin Cells, and the LBC research team members for their contributions to sample collection,

- 1 sample processing, and data processing respectively. Finally, we thank The David and Janet Polak Foundation
- 2 for their support of the Cedars-Sinai iPSC Core laboratory.
- 3

4 Competing interests

- US patent US 10,221,395 B2 has been granted describing some of the methods to reprogram to iPSCs. Apart
 from this issued patent filing the authors have declared that no other competing financial interests exist.

27 Abstract:

Cognitive decline is among the most feared aspects of ageing. We have generated induced pluripotent stem
cells (iPSCs) from 24 people from the Lothian Birth Cohort 1936, whose cognitive ability was tested in
childhood and in older age. Peripheral blood mononuclear cells (PBMCs) were reprogrammed using nonintegrating oriP/EBNA1 backbone plasmids expressing six iPSC reprogramming factors (OCT3/4 (POU5F1),
SOX2, KLF4, L-Myc, shp53, Lin28, SV40LT). All lines demonstrated STR matched karyotype and pluripotency
was validated by multiple methods. These iPSC lines are a valuable resource to study molecular mechanisms
underlying individual differences in cognitive ageing and resilience to age-related neurodegenerative diseases.

2 **Resource utility**

3 The neurobiology of cognitive ability and its decline during ageing are poorly understood. Human iPSC lines

4 from the Lothian Birth Cohort 1936 comprise individuals with rich life-course cognitive performance data

(Taylor et al., 2018; Wardlaw et al., 2011), affording a rare model to investigate molecular mechanisms
 relevant to differences in brain development, cellular resilience, and vulnerability to pathology.

3

4 **Resource Details**

5

Human peripheral blood mononuclear cells (PBMCs) were obtained from 24 unrelated members of the
Lothian Birth Cohort 1936. Demographic parameters are 50% female (n = 12), 100% white Scottish (Table 1).
Line donors can be grouped into 'successful', 'typical', and 'poor' cognitive ageing categories (sFig.1). Exclusion
criteria were: self-reported dementia, Parkinson's disease or stroke, Mini Mental State Examination (MMSE
score <24, as well as standardised childhood IQ scores (<65, Moray House Test No. 12 at age 11), and
standardised adult IQ scores (<85, average of Moray House Test No. 12 at age 70 and 76).

12

PBMCs were reprogrammed to generate induced pluripotent stem cells (iPSCs) using episomal plasmids 13 encoding human OCT3/4 (POU5F1), SOX2, KLF4, L-Myc, shp53, Lin28, SV40LT. All lines were reprogrammed 14 15 and stored within 22 months of each other. EBNA-related gene analysis demonstrated that iPSCs were EBNA 16 transgene-free (and therefore exogenous reprogramming factors were no longer present) by passage 17-21 (depending on line). Qualitative tests for parental cell type by TCR- $\alpha\beta$ and TCR- $\gamma\delta$ T-cell clonality assay 17 revealed that 83% (n = 20) of lines were non-T cell-derived, 17% (n = 4) were T-cell derived. T-cell derived lines 18 19 are: EDi021-A, EDi025-A, EDi026-A, and EDi035-A. All lines have been confirmed mycoplasma negative 20 (sFig.27).

21

22 All lines demonstrated stem cell-like morphology (Fig1F, sFig2-24F) and expressed six pluripotency markers 23 (OCT3/4, NANOG, SOX2, TRA-1-60, TRA-1-81, SSEA4) evaluated by immunocytochemistry (Fig.1B, sFig.2-24B). 24 Additionally, all lines demonstrated positive alkaline phosphatase AP staining (Fig.1A, sFig.2-24A) and self-25 renewal in undifferentiated iPSCs as assessed by PluriTest (Fig.1C, sFig.2-24C) and TaqMan®hPSC Scorecard[™] Panel (Fig.1D, sFig.2-24E). However, whilst EDi035-A had a positive PluriTest and Scorecard[™] pluripotency 26 27 result, the PluriTest novelty score was borderline (1.688) (sFig.14C,E). Furthermore, EDi027-A also had a borderline positive ectoderm score as assessed by Scorecard[™] (sFig.6E). At 14 days of embryoid body 28 29 differentiation, all lines demonstrated tri-lineage potential except EDi022-A (negative endoderm, borderline 30 mesoderm score, sFig.2E), EDi035-A (negative mesoderm, borderline endoderm score, sFig.14E), and EDi042-A 31 (negative endoderm score, sFig.21E), as assessed by Scorecard[™].

32

All lines showed a normal karyotype (Fig.1D, sFig. 2-24D) between passages 6-22, with one exception. All five
 clones of EDi-038-A (a male) karyotyped as monosomy (45,X) (sFig.18D), and thus very likely stems from the
 source PBMCs. Mosaicism is a relatively common and probably harmless finding in blood cultures from normal

females and, though rarer, also in males (Bukvic et al., 2001). No differences were detected between the
 original PBMC samples and the corresponding iPSC lines.

3

4 All lines were confirmed to be of human origin and iPSCs matched the profile of parent PBMCs by Short 5 Tandem Repeat (STR) analysis. Parent line data was not available for EDi026-A and EDi028-A. Genetic profiles 6 for these lines were compared to the cell line genetic profiles available in the DSMZ STR database and did not 7 match any other reported profiles in the DSMZ database. These profiles were found to be unique and did not 8 match to any previously submitted profiles from the iPSC Core. The genetic profiles established here can be 9 used for future comparisons for these cell lines. Whole genome sequence data for all 24 lines has been 10 deposited at the European Genome-phenome Archive (EGA), which is hosted by the EBI and the CRG, under 11 accession number EGAS00001003819.

12

An overview of iPSC line characterisation can be found in Table 2. Figure 1 presents example characterisation
data from EDi021-A. Data for all other lines can be found in Supplementary Figures 2-27.

15

16 Materials and Methods

17

18 **PBMC isolation**

Blood samples were collected with NHS Lothian Research Ethics Committee Approval (10/S1103/10). Blood
samples were collected in Sodium Citrate BD Vacutainer CPT tubes (BD, Cat. 362761) (three tubes per
participant). For samples EDi021-A, EDi025-A, EDi028-A, EDi030-A, EDi031-A, EDi032-A, EDi033-A, EDi034-A,
and EDi035-A PBMC isolation was performed by Roslin Cells. For all other lines, PBMC isolation was performed
by the Edinburgh Clinical Research Facility (ECRF).

24

25 Generation of human iPSCs

Generation of human iPSCs lines from PBMCs was performed using nucleofection of episomal plasmids
 containing POU5F1, SOX2, KLF4, LIN28, L-MYC, TP53shRNA, and SV40LT.

28

29 Briefly, ~5×10⁶ cells per nucleofection of PBMCs were nucleofected with the Amaxa Human T-cell

30 Nucleofector[®] Kit (Lonza, Cat. VVPA-1002) and a 5p plasmid mixture using program V-024 on a Amaxa

31 Nucleofector 2D Device (Lonza, Cat. AAB-1001). Each transfection contained the following seven factors:

- 32 OCT4, SOX2, KLF4, LMYC, LIN28, SV40LT and p53 shRNA. These were delivered on the following plasmids from
- 33 Addgene, together with an EBNA1 plasmid for episomal plasmid maintenance: pEP4 E02S ET2K (Cat. 20927),
- 34 pCXLE-hOCT3/4-shp53-F (Cat. 27077), pCXLEhUL (Cat. 27080), pCXLE-hSK (Cat. 27078), and pCXWB-EBNA1
- 35 (Cat. 37624). Each transfection used 0.5μg of plasmid pCXWB-EBNA1 and 0.83μg of each of the remaining four
- 36 plasmids. After nucleofection, cells were immediately plated in either $\alpha\beta$ T-cell medium (X-vivo10 [Lonza, Cat.

1 04-380Q] supplemented with 30U/ml IL-2 [ThermoFisher Scientific, Cat. PHC0026] and 5µl/well Dynabeads

- 2 Human T-activator CD3/CD28 [Life Technologies, Cat. 11161D]) or non T-cell medium (αMEM [Life
- 3 Technologies, Cat. 12561056] supplemented with 10% Heat Inactivated-FBS [Life Technologies, Cat.
- 4 10437028], 10ng/ml IL-3 [StemCell Technologies, Cat. 78040.1], 10ng/ml IL-6 [StemCell Technologies, Cat.
- 5 78050.1], 10ng/ml G-CSF [StemCell Technologies, Cat. 78012.1] and 10ng/ml GM-CSF [StemCell Technologies,
- 6 Cat. 78015.1]) onto mitomycin treated mouse embryonic fibroblasts (MEF) and placed in a 37°C incubator
- 7 with 20% O2 and 5% CO2.
- 8

9 Two days after nucleofection, 2mL/well of Primate ESC medium (ReproCell, Cat. RCHEMD001) containing 5ng/ml bFGF (for MEF condition) was added to the wells without aspirating the previous medium. Beginning 10 11 on day four, the medium was gently aspirated from each well and 2mL of the appropriate fresh 12 reprogramming media was added to each well. Medium was replaced every other day. At approximately day 13 18 post nucleofection, individual colonies were observed in all wells of each condition. Individual PBMC-iPSC 14 colonies with ES/iPSC-like morphology appeared between day 25-32 and those with best morphology were 15 mechanically isolated, transferred onto 12-well plates with fresh Matrigel™ Matrix (Corning/BD Biosciences, Cat. 354230), and maintained in mTeSR[®]1 medium (StemCell Technologies, Cat. 85850). The iPSC clones were 16 17 further expanded and scaled up for further analysis. All cultures were maintained at 37°C, 20% O₂, and 5% CO₂ 18 throughout the reprogramming process.

19

20 *iPSC maintenance and storage*

21 Human iPSCs were cultured in mTeSR®1 medium (StemCell Technologies, Cat. 85850) on growth factor-22 reduced Matrigel[™] Matrix (Corning, Cat. 354230) -coated plates at 37°C in a 20% O₂, 5% CO₂ incubator. Briefly, 70–90% confluent human iPSC colonies were passaged every 7 days chemically (Versene, Life Technologies, 23 24 Cat. 15040-066 or ReLeSR, StemCell Technologies, Cat. 05872) or mechanically by StemPro® EZPassage™ 25 Disposable Stem Cell Passaging Tool (Life Technologies, Cat. 23181-010) and re-plated at a 1:6 or 1:9 ratio 26 depending on the cell line. The iPSCs were passaged every 5-7 days. The iPSCs were expanded for 6-22 27 passages during which period various characterization assays were performed. The iPSCs were cryopreserved 28 using CryoStor CS10 (StemCell Technologies, Cat. 07930) and an isopropanol freezing vessel at -80°C 29 overnight. The cryopreserved vials were subsequently stored in liquid nitrogen tanks for long-term storage. 30 Working Cell Banks (WCB) of iPSCs were cryopreserved at passage 9-14 and then Distribution Cells Banks 31 (DCB) were created between passages 18-22.

32

33 Mycoplasma testing

The absence of mycoplasma contamination in the iPSC lines were confirmed monthly using the MycoAlert
 Detection Kit, a selective biochemical test (LONZA, Cat. LT07-1188).

1 EBNA-related gene analysis

2 250ng of genomic DNA was extracted using the KingFisherTM DUO Prime purification system (Thermo Fisher

- Scientific) and the MagMAXTM DNA Multi-Sample Ultra 2.0 Kit (Applied Biosystems, A36570). An embryonic
 stem cell line (H9) was included alongside LBC lines a negative control. DNA Amplification was conducted
- 5 using TaKaRa Ex Taq[®] DNA Polymerase (TaKaRa Bio, RR001) and a Bio Rad 1000 Touch Thermal Cycler.
- 6 Primers that recognize EBNA1 along with housekeeping gene Glyceraldehyde 3-phosphate dehydrogenase
- 7 (GAPDH), which was used as a housekeeping gene, were included in this study (Table 2). PCR was run for 35
- 8 cycles at 95°C for 30 seconds, 60°C for 30 seconds, and 72°C for 30 seconds.
- 9

10 TCRB and TCRG T-Cell Clonality Assay

TCRB and TCRG T-Cell Clonality testing was conducted using Gene Rearrangement and Translocation assays
from Invivoscribe Technologies, Inc. Genomic DNA was harvested from all iPSC lines using the MagMAX[™] DNA
Multi-Sample Ultra 2.0 Kit (Cat. A36570) from Applied Biosystems and it was re-suspended to a final
concentration of 100-400µg per ml in dilution buffer. Three Clonal Control DNA and one Polyclonal Control
DNA provided with the kit were used. PCR was carried out as per the manufacturer's protocol. PCR products
were analysed using 6% TBE gel electrophoresis with gel red staining.

17

18 Karyotyping

19 Human PBMC-iPSCs were incubated in Colcemid (100ng/mL; Life Technologies) for 30 minutes at 37°C and 20 then dissociated using TrypLE for 5 minutes. They were then washed in phosphate buffered saline (PBS) and 21 incubated at 37°C in 5mL hypotonic solution (1g KCl, 1g Na Citrate in 400mL water) for 30 minutes. The cells 22 were centrifuged for 2.5 minutes at 1500RPM and re-suspended in fixative (methanol: acetic acid, 3:1) at room temperature for 5 minutes. This was repeated twice, and finally cells were re-suspended in 500µl of 23 24 fixative solution and submitted to the Cedars-Sinai Clinical Cytogenetics Core for G-band karyotyping. 25 Karyotyping of each iPSC line was conducted at early and late passage, between passages 6-22. Approximately 26 20 metaphase spreads were counted per line.

27

28 Immunocytochemistry

29 iPSCs were plated on Matrigel[™] (Corning, Cat. 354230) -coated glass coverslips or optical-bottom 96-well 30 plates (ThermoFisher Scientific, Cat. 165305) and subsequently fixed in 4% paraformaldehyde (10 minutes, room temperature (RT)). The blocking buffer used was 5% goat serum (Millipore, Cat. S26-100ML) and 5% 31 32 donkey serum (Millipore, S30-100ML) with 0.15% Triton X-100 in PBS, except for SSEA4 and OCT4 staining, for 33 which 5% goat serum with 0.15% Triton X-100 in PBS was used as the block. All cells were blocked for one hour at RT, then incubated with primary antibodies (Table 3) for either 3 hours at RT or overnight at 4°C. Cells 34 35 were then rinsed and incubated in species-specific AF488 or AF594-conjugated secondary antibodies (1:500, 36 diluted in the same block as the primary antibodies) for one hour at RT, followed by DAPI (0.5-1µg/ml; Sigma)

- 1 to counterstain nuclei (10 minutes, RT). Cells were imaged using Nikon/Leica microscopes or Image Express.
- 2 The iPSCs exhibited an embryonic stem cell like morphology, and expressed a range of pluripotency markers
- 3 (OCT3/4, NANOG, SOX2, TRA-1-60, TRA-1-81, SSEA4) (Figure 1B, Supplementary Figures 2-24B).
- 4

5 Alkaline phosphatase staining

Alkaline phosphatase staining was performed using the Alkaline Phosphatase Staining Kit II (Stemgent, Cat. 000055) according to the manufacturer's instructions.

8

9 PluriTest

10 PluriTest was used to assess the pluripotency of undifferentiated iPSCs (Figure 1C, Supplementary Figures 2-11 24C). Cell pellets were sent to Life Technologies Corporation for the PluriTest Service. Total RNA was isolated 12 using the PureLinkTM RNA Mini Kit (Thermo Fisher Scientific) and quantified using NanoDropTM. 100ng total RNA was used to prepare the GeneChip[®] for the PluriTest[™]. In this assay, 36,000 transcripts and variants 13 14 against a >450 sample reference set are assessed for gene expression analysis. A non-iPSC sample was used in this experiment to serve as a control for non-pluripotency. The transcriptome of all samples were analysed 15 16 and processed in the PluriTest[™] algorithm to generate a pluripotency and novelty score. These two scores determine the pluripotency signature of the cell line which is represented in the pluripotency plot. The 17 18 threshold for pluripotency was >20, and the threshold for novelty was <1.6.

19

20 hPSC Scorecard Data Analysis

Applied Biosystems TaqMan[®]hPSC Scorecard[™] Panel (Thermo Fisher Scientific) was used as an additional 21 22 technique to assess pluripotency and tri-lineage differentiation potential of iPSC lines using real-time qPCR assays (Figure 1E, Supplementary Figures 2-24E). Total RNA from undifferentiated and EB differentiated iPSC 23 lines was isolated using MagMAX[™] mirVana[™] Total RNA Isolation Kit (A27828), and 1µg of RNA was used to 24 25 make cDNA using the High Capacity cDNA Reverse Transcription Kit (4368813), both from Applied Biosystems. 26 TaqMan qRT-PCR was carried out using the hPSC Scorecard 384w Fast plate (Life technologies, A15870) and 27 QuantStudio 12k Flex, following manufacturer protocol. We analysed the gene expression data from the TaqMan[®]hPSC Scorecard[™] Panel using the web-based hPSC Scorecard[™] Analysis Software (Thermo Fisher 28 29 Scientific).

30

31 Embryoid Body (EB) Formation

IPSC lines were allowed to differentiate by EB formation. Briefly, iPSCs were lifted from 3 wells of a 6 well
plate using a cell scraper and seeded in a T25 flask treated with poly-HEMA to prevent cell attachment in EB
media containing: IMDM basal media (Cat. 12440061), 17% KnockOut Serum Replacement (KOSR; Cat.
10828028), 1% non-essential amino acids (Cat. 11140050), 1% Antibiotic-Antimycotic (Cat. 15240062) and
110µM β-Mercaptoethanol (Cat. 21985023), all from Thermo Fisher. EBs were allowed to form by self-

1 aggregation, grow and differentiate for 14 days in EB culture media replacing it twice a week. Differentiation

2 to endoderm, mesoderm and ectoderm was assessed by TaqMan[®] hPSC Scorecard[™] Assay (Figure 1E,

- 3 Supplementary Figures 2-24E).
- 4
- 5

6 STR Analysis

Short Tandem Repeat (STR) Analysis is conducted to confirm iPSC genetic identity. For that, a frozen vial of the parent PBMCs and a frozen vial of the reprogramed iPSC line at late passage (18-21, depending on the cell
line) are sent to IDEXX BioResearch. STR profile and interspecies contamination testing is analysed. iPSC line
human authentication was conducted at IDEXX BioResearch by Cell Check[™]. Profiling included using a nine
marker STR profile (AMEL, CSF1PO, D13S317, D16S539, D5S818, D7S820, TH01, TPOX and vWA) and
interspecies contamination check for human, mouse, rat, African green monkey and Chinese hamster cells.

- 13 Comparative analysis was conducted between parent PBMCs and reprogrammed iPSC lines.
- 14

15 Funding

- 16 This work was funded by MRC Dementias Platform UK Stem Cell Network Capital Equipment
- 17 MC_EX_MR/N50192X/1 and Partnership Award MR/N013255/1, the UK Dementia Research Institute which
- 18 receives its funding from DRI Ltd, funded by the UK Medical Research Council, Alzheimer's Society, and
- 19 Alzheimer's Research UK, and the European Research Council (ERC) under the European Union's Horizon 2020
- 20 research and innovation programme (Grant agreement No. 681181). Funding for the Lothian Birth Cohort 1936
- 21 (LBC1936) has been received from Research Into Ageing programme grant and the Age UK-funded
- 22 Disconnected Mind project. Additional funding from the UK Medical Research Council (MRC; G0701120,
- G1001245, MR/M013111/1; MR/R024065/1), National Institutes of Health (R01AG054628) and the University
 of Edinburgh is gratefully acknowledged. This work was undertaken as part of the Cross Council and University
- of Edinburgh is gratefully acknowledged. This work was undertaken as part of the Cross Council and University
- 25 of Edinburgh Centre for Cognitive Ageing and Cognitive Epidemiology (CCACE), funded by the Biotechnology
- and Biological Sciences Research Council (BBSRC) and the MRC (MR/K026992/1). A portion of the personnel
- 27 support for the generation and maintenance of iPSCs was supported by Cedars-Sinai Institutional Funds. The
- funders had no role in study design, data collection and analysis, decision to publish, or preparation of themanuscript.
- 30

31 Acknowledgements

- 32 We thank the LBC1936 participants who took part in this study, and gratefully acknowledge the contribution of
- the late Professor John M. Starr, who was the Lothian Birth Cohort 1936's research medical doctor from its
- 34 beginning in 2004 until 2018. Additionally, we would like to thank the Edinburgh Clinical Research Facility
- 35 nursing staff, Roslin Cells, and the LBC research team members for their contributions to sample collection,

- 1 sample processing, and data processing respectively. Finally, we thank The David and Janet Polak Foundation
- 2 for their support of the Cedars-Sinai iPSC Core laboratory.
- 3

4 Competing interests

- US patent US 10,221,395 B2 has been granted describing some of the methods to reprogram to iPSCs. Apart
 from this issued patent filing the authors have declared that no other competing financial interests exist.

sFig26: Data showing T-cell clonal lineage for LBC iPSCs. For each line, three targets (Vß +Jß1/2, Vß +Jß2 and Dß +Jß1/2) were tested for T-Cell Receptor Beta Chain (TCRB), and two targets (Vg1-8, Vg10+Jg1.3/2.3; Vg9 and Vg11+ Jg1.3/2.3) for T-Cell Receptor Gamma Chain (TCRG). A-B-C) Representative 6% TBE Gel image for TCRB. D-E) Representative 6% TBE Gel image for TCRG. F) Representative 6% TBE Gel image for Control Genes. G) Table listing each of the LBC iPSC lines, indicating positivity (+) or negativity (-) for each of the T-cell receptors. Lines were considered positive if any band was present in any of the samples.

sFig.27: Data showing the results of mycoplasma testing from iPSCs stored at two sites. A) PCR conducted by IDEXX BioAnalytics for samples provided by Cedars-Sinai Medical Center, All 24 LBC lines shown in green, positive control in red. B) Table showing results of MycoAlert Lonza LT07-318 assay conducted by Dementias Platform UK for available lines. Ratio values stated are the ratio of the luminescence signal of the kit substrate to that of the kit reagent. A ratio of 0-0.999 is negative for mycoplasma, 1-1.3 is borderline (requiring retest), and >1.3 is positive for mycoplasma. All samples tested at both sites were negative for mycoplasma.
