#### Water Loss Test Results: West Main Canal United Irrigation District of Hidalgo County

#### **SUMMARY**

This report summarizes the results of ponding tests conducted in United Irrigation District of Hidalgo County (United) to measure losses in three segments of the West Main Canal. The ponding tests took place during July 10-12, 2001 and February 22-23, 2002, respectively.

The three test segments were located as follows:

- Test segment UN1 East of Inspiration Rd beginning just south of 7 Mile Rd.
- Test segment UN2 East of Inspiration Rd and 8 Mile Rd.
- Test segment UN3 East of Inspiration Rd and north of 6 Mile Rd.

Test results are summarized in Tables 1 and 2 and were as follows:

- The average seepage loss rate measured for Test Segment UN1 was 2.29 gal/ft<sup>2</sup>/day.
- The average seepage loss rate measured for Test Segment UN2 was 2.11 gal/ft<sup>2</sup>/day.
- Test Segment UN3 had two turnout gates (unable to be verified as leaking) that may have contributed to the total loss rate of 2.11 gal/ft²/day. Test was performed with water level being only 50% total depth.

Table 1	Table 1. Summary of ponding test results conducted on the West Main Canal.								
Test ID	District Segment ID	Soil**	Length (ft)	Top Width (ft)	Test Type	Loss rate Gal/ft²/day		ss in Canal t/mile) per year

Test ID	ft/hr	ft/day	in/hr	in/day			
UN1	0.019	0.447	0.223	5.36			
UN2	0.017	0.398	0.199	4.77			
UN3	0.016	0.388	0.194	4.65			

Figure 1. Large cracks and aquatic vegetation shown above contribute to higher total losses of canal segments.

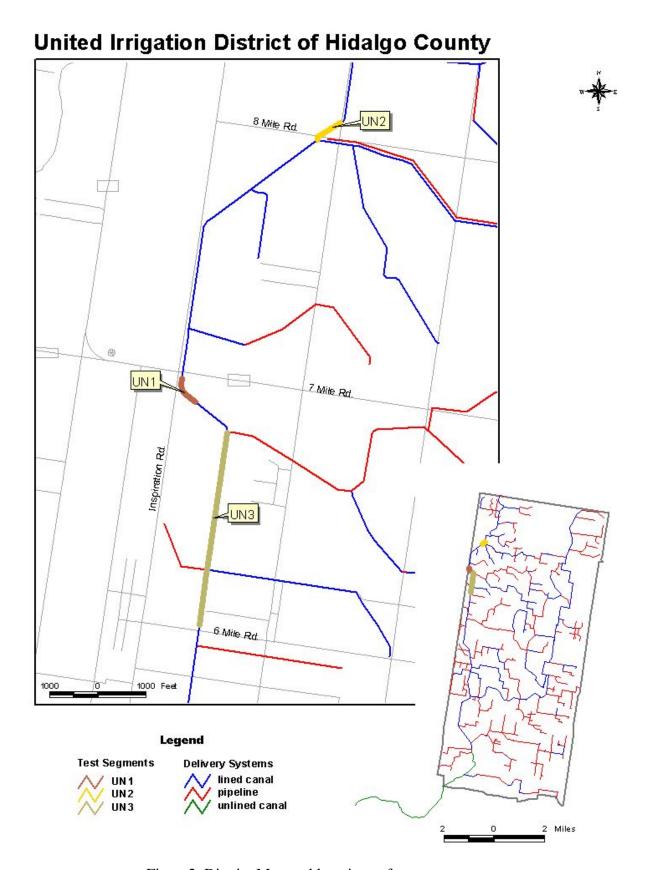

Figure 2. District Map and locations of test segments.

#### MATERIALS AND METHODS

Canal loss rates were measured using the ponding method. In this method, the two ends of a canal segment are closed or sealed with earthen dams as shown in Figure 3. Once sealed, water elevations are taken for approximately 24 to 48 hours. Five to six staff gauges (Fig. 4) were placed in each test segment, and stage levels were recorded manually. Canal dimensions and water spans were also surveyed during the test.

The tests are classified as follows:

- Test segment UN1 did not contain valves or gates within the canal; thus, the seepage rate was measured.
- Test segment UN2 did not contain valves or gates within the canal; thus, the seepage rate was measured.
- Test segment UN3 contained several leaking turnout gates; thus, we classify this as a <u>total loss</u> test since the gates contributed to the measured losses.

Tables 3, 4, and 5 provide details on the test segments; data collected and recorded changes in water depths during the tests. The canal cross-sections at each of the staff gauges are illustrated in Figure 6 for test UN1, Figure 10 for test UN2, and Figure 12 for test UN3. Also shown on these charts are the water depths at the beginning of the test.
