A Ata da defesa assinada pelos membros da Comissão Examinadora, consta no SIGA/Sistema de Fluxo de Dissertação/Tese e na Secretaria do Programa da Unidade.

Este exemplar corresponde à redação final da Dissertação de Mestrado defendida pela aluna **Carolina Muller Ferreira**, aprovada pela Comissão Julgadora em **17 de novembro de 2020**.

*Dedico este trabalho aos meus pais Walter e Patrícia, aos meus irmãos Otávio e Geovana, e meus amigos Maisa, Rafael, Fabiana, Mariana, Rebeca e vários outros amigos que indiretamente sempre apoiaram na minha formação pessoal e profissional.*

## **AGRADECIMENTO**

Agradeço em primeiro lugar aos meus pais, Walter e Patrícia que sempre me apoiaram nas minhas escolhas e nunca me deixaram desistir dos meus sonhos.

Agradeço aos meus irmãos, Otávio e Geovana, que sempre me trouxeram felicidade nos momentos difíceis.

Agradeço aos meus amigos, pela cumplicidade, ajuda e amizade que contribuíram de forma direta ou indireta na conclusão deste trabalho.

Agradeço a minha orientadora Dra. Taís Freire Galvão, pela oportunidade concedida, pelo conhecimento transmitido, pela confiança depositada em mim e pela paciência durante o desenvolvimento de todo esse trabalho.

Agradeço os professores Dr. Marcus Tolentino e professora Dra. Dorotéia Höfelmann, pela ajuda nas etapas desse projeto e pelo conhecimento fornecido.

Agradeço as alunas de iniciação científica e trabalho de conclusão de curso, Andresa Castro, Natália Reis e Raisia Gusmão, pela ajuda e comprometimento fornecido nesse trabalho.

Agradeço também aos funcionários e professores da Faculdade de Ciências Farmacêuticas da UNICAMP, que me auxiliaram e contribuíram para a minha formação acadêmica.

Por fim, agradeço aos membros da banca examinadora, pela disposição em avaliar o presente trabalho.

O presente trabalho foi realizado com apoio da Coordenação de Aperfeiçoamento de Pessoal de Nível Superior - Brasil (CAPES) - Código de Financiamento 001 bem como o apoio do Conselho Nacional de Desenvolvimento Científico e Tecnológico (CNPq) e do Ministério da Saúde no qual a presente pesquisa foi contemplada como linha de financiamento no edital CNPq Nº 10/2017 - Revisões Sistemáticas em Alimentação e Nutrição,

## RESUMO

Contexto: Faltam estimativas representativas da obesidade infantil no Brasil. Objetivo é estimar a prevalência de obesidade infantil no Brasil. Métodos: Realizamos uma revisão sistemática (protocolo: CRD42018091713) e pesquisamos estudos de base populacional realizados no Brasil que avaliaram a obesidade em crianças <10 anos. Pesquisadores emparelhados selecionaram e extraíram os dados dos estudos. A meta-análise de prevalência e intervalo de confiança (IC95%) foi calculada, ponderada pelos tamanhos da população usando a transformação de arco-cosseno duplo de Freeman-Tukey. A heterogeneidade ( $I^2$ ) foi investigada por meta-regressão. Resultados: 53 estudos foram incluídos ( $n = 122.395$ ), realizados de 1986-2015, e limitados principalmente devido a taxas de resposta inadequadas. A prevalência de obesidade foi de 8,2% ([IC 95%]: 8,1-8,4%,  $I^2 = 98,5\%$ ). Prevalências mais altas foram observadas em meninos (9,7% [9,4-9,9%],  $I^2 = 97,4\%$ ) do que em meninas (7,3% [7,1-7,5%],  $I^2 = 96,1\%$ ). A prevalência aumentou de acordo com a década (1990: 6,5% [6,0-7,0%],  $I^2 = 96,8\%$ ; 2000: 7,9% [7,7-8,0%],  $I^2 = 98,8\%$ ; 2010: 12,0% [11,5-12,6%],  $I^2 = 95,8\%$ ), e região brasileira (Nordeste: 6,4% [6,2-6,7%],  $I^2 = 98,1\%$ ; Norte: 6,7% [6,3-7,2%],  $I^2 = 98,8\%$ ; Sudeste: 10,6% [10,2-11,0 %],  $I^2 = 98,2\%$ ; Sul: 10,1 [9,7-10,4%],  $I^2 = 97,7\%$ ). A heterogeneidade foi afetada pela idade e região ( $p < 0,05$ ) e o viés de publicação foi descartado ( $p = 0,746$ ). Conclusão: Para cada 100 crianças brasileiras, mais de oito apresentam obesidade. Prevalências maiores ocorreram em meninos, nas últimas décadas e em regiões brasileiras mais desenvolvidas.

Palavras-chave: Obesidade Pediátrica, Brasil, Prevalência, Revisão Sistemática, Meta-análise.

## ABSTRACT

Background: Representative estimates of childhood obesity in Brazil are lacking. Objective is to estimate the prevalence of childhood obesity in Brazil. Methods: We conducted a systematic review (protocol: CRD42018091713) and researched population-based studies conducted in Brazil that assessed obesity in children <10 years old. Paired researchers selected and extracted data from the studies. The meta-analysis of prevalence and confidence interval (95% CI) was calculated, weighted by population sizes using the Freeman-Tukey double cosine transformation. Heterogeneity ( $I^2$ ) was investigated by meta-regression. Results: 53 studies were included (n = 122,395), carried out from 1986-2015, and limited mainly due to inadequate response rates. The prevalence of obesity was 8.2% ([95% CI]: 8.1-8.4%,  $I^2 = 98.5\%$ ). Higher prevalence were observed in boys (9.7% [9.4-9.9%],  $I^2 = 97.4\%$ ) than in girls (7.3% [7.1-7.5%],  $I^2 = 96.1\%$ ). The prevalence increased according to the decade (1990: 6.5% [6.0-7.0%],  $I^2 = 96.8\%$ ; 2000: 7.9% [7.7-8.0%],  $I^2 = 98.8\%$ ; 2010: 12.0% [11.5-12.6%],  $I^2 = 95.8\%$ ), and the Brazilian region (Northeast: 6.4% [6.2-6.7 %],  $I^2 = 98.1\%$ ; North: 6.7% [6.3-7.2%],  $I^2 = 98.8\%$ ; Southeast: 10.6% [10.2-11.0%],  $I^2 = 98.2\%$ ; South: 10.1 [9.7-10.4%],  $I^2 = 97.7\%$ ). Heterogeneity was affected by age and region ( $p < 0.05$ ) and the publication bias was discarded ( $p = 0.746$ ). Conclusion: For every 100 Brazilian children, more than eight have obesity. Higher prevalence occurred in boys, in the last decades and in more developed Brazilian regions.

**Key words:** Pediatric Obesity, Brazil, Prevalence, Systematic Review, Meta-analysis.

## 1. Introdução

A obesidade é um acúmulo anormal ou excessivo de gordura que apresenta risco à saúde.<sup>1 2</sup> A identificação da criança com obesidade é influenciada pela idade, sexo, status de puberdade, raça e etnia, sendo definida a partir de pontos de corte do índice de massa corporal e sua relação com as curvas de crescimento oficiais.

Apesar de comum, há diferentes hipóteses sobre a etiologia da obesidade. A mais aceita é o resultado de desequilíbrio entre o consumo de calorias e o gasto energético,<sup>3</sup> associado ao alto consumo de carboidratos<sup>4</sup> e alimentos ultra-processados,<sup>5</sup> podendo ser tratada com uma dieta balanceada e atividade física.<sup>6</sup> Outra teoria aborda uma possível relação hormonal, por meio da ação da grelina e a leptina e suas cascatas hormonais bem como suas atuações por *feedback*.<sup>7</sup> Esses hormônios atuam desreguladamente, induzindo por vezes a hiperleptinemia, um processo de invasão de macrófagos que contribuem para as reações pró-inflamatórias, favorecendo a hiperplasia e hipertrofia do tecido adiposo e o estado de adipogênese.<sup>7</sup> O cortisol, hormônio ligado ao estresse, também pode estar envolvido.<sup>8</sup> Esse hormônio é normalmente estimulado pela privação de sono e manutenção do estado de alerta, onde uma duração do sono menor que 6 horas é significativamente associada a um ganho de peso e obesidade.<sup>9</sup>

A hiperinsulinemia e a resistência à leptina é um achado comum entre pessoas com obesidade.<sup>10</sup> Não se sabe ao certo como ocorrem as cascatas hormonais e suas ligações, mas estima-se que essa resistência à leptina impeça a transdução normal do sinal da leptina, que como consequência gera uma ingestão calórica contínua e a obesidade.<sup>10</sup> Além disso, a obesidade pode advir de causas genéticas, ambientais e socioeconômicas, sendo caracterizada como uma patologia multicausal.<sup>11</sup>

A oferta de alimentos ultraprocessados com menor preço e facilidade de acesso que alimentos in natura e pouco processados influencia o estabelecimento de preferências alimentares na infância.<sup>12</sup> A definição de preferências nessa fase tem papel determinante nas escolhas e hábitos no futuro, tornando difícil a aquisição de hábitos considerados saudáveis na idade adulta.<sup>12</sup> Aliado a trabalhos menos operacionais e mais sedentários parecem favorecer o aumento de peso na vida adulta.<sup>13</sup> Em contrapartida, trabalho mais operacionais geram menores salários, o que não são atrativos e não favorecem economicamente.<sup>12</sup>

Em países de baixa e média renda, o aumento da obesidade em crianças pode gerar consequências quando na fase adulta, favorecendo a ocorrência de doenças crônicas não

transmissíveis como diabetes, hipertensão, problemas cardiovasculares, gastrintestinais, renais e imunológicas.<sup>7</sup>

A carga de doenças associadas afeta o sistema de saúde e a sociedade, além de efeitos psicológicos ao indivíduo. Entre eles estão os preconceitos e estigmas sociais, associados à degradação social por meio de atitudes negativas dirigidas a uma pessoa com base em seu peso<sup>14</sup>. Os estereótipos podem levar a preconceitos, rejeição social, tratamento injusto ou discriminação aberta, bem como problemas psicossociais irreversíveis. O *bullying* com base no peso e como uma forma de escapar desse estigma, gera crianças que evitam a escola e afetam o desempenho acadêmico e as oportunidades socioeconômicas futuras.<sup>15</sup>

A obesidade é reconhecidamente de difícil manejo e muitas práticas clínicas são estimuladas na tentativa da solução em curto ou longo prazo. O estímulo à atividade física, – dentro e fora da escola –, melhoria na alimentação, seja por meio de dietas de baixo teor de carboidrato<sup>16</sup>, com alto conteúdo de proteína ou gordura, refeições em menor frequência, com jejum intermitente, são exemplos de tratamento.<sup>16 17</sup> Outras formas associadas são o acompanhamento psicológico, avaliação genética, recomendação de cirurgias e terapias medicamentosas.<sup>7 11</sup>

O gasto médico anual atribuído a um indivíduo com obesidade representou cerca de 150 bilhões de dólares nos Estados Unidos.<sup>18</sup> No Brasil, cerca de 3 a 5% das internações em adultos de 20 a 60 anos no Sistema Único de Saúde, foram atribuídas a doenças relacionadas à obesidade em 2001.<sup>19</sup> Os gastos individuais também parecem ser afetados pelo excesso de peso ou obesidade no domicílio, tendo maior carga econômica em domicílios pobres devido sua contribuição com gastos em medicamentos relacionados com a obesidade.<sup>20</sup>

A definição de políticas públicas e instituição de incentivos financeiros setoriais influenciam nessa dinâmica. Nos Estados Unidos, um exemplo são os subsídios para o milho e soja, que promovem o uso excessivo desses produtos pelos produtores e aumento do consumo de alimentos de menor custo e menor valor nutricional.<sup>12</sup> Revisar políticas anteriores para identificar falhas e potenciais de atuação são estratégias para reduzir a obesidade infantil,<sup>12</sup> incluindo restrições da influência de mídias e propaganda.<sup>21 22</sup>

Em todo o mundo, a prevalência de sobrepeso e obesidade na infância aumentou de apresentou aumento relativo de 60% entre as décadas de 1990 e 2020.<sup>7</sup> Ao longo de 22 anos, a prevalência de sobrepeso e risco de sobrepeso aumentou quase linearmente.<sup>23</sup> A tendência de aumento é prevista ao longo das próximas décadas.<sup>7 24</sup>

O último inquérito populacional realizado no Brasil em 2008-2009 observou que 17% dos meninos e 12% das meninas até 10 anos apresentaram obesidade, prevalência maior que o observado nas décadas de 1980 e 1990.<sup>25</sup> A obesidade foi estimada em 19% dos adultos brasileiros em 2017 e 20% em 2018, conforme a pesquisa de Vigilância de Fatores de Risco e Proteção para Doenças Crônicas por Inquérito Telefônico.<sup>26</sup> Dentre os inquéritos nacionais (domiciliares, escolares e telefônicos) realizados de 1974 a 2014 há carência de estimativas recentes acerca da obesidade infantil.<sup>27</sup>

Na ausência de estimativas nacionais, a síntese dos estudos individuais é uma alternativa para estimar e monitorar a obesidade infantil. As revisões sistemáticas disponíveis na área apresentam limitações por incluir estudos primários sem representatividade populacional,<sup>28-32</sup> critério de obesidade obsoleto ou não oficial<sup>28 33</sup> e ausência de critério de qualidade metodológica dos estudos incluídos.<sup>28 30 33</sup>

A presente pesquisa foi realizada para preencher essa lacuna, em atendimento a uma demanda do Ministério da Saúde para embasar políticas públicas na área. O objetivo desta pesquisa foi estimar a prevalência da obesidade infantil no Brasil por meio de revisão sistemática com meta-análise.

**2. Artigo submetido a periódico – *Prevalence of childhood obesity in Brazil: a systematic review and meta-analysis* [APÊNDICE A].**

**Introduction**

Obesity affects 5% of children worldwide and increased by 20% from 1980 to 2015, with the highest prevalence in economically disadvantaged settings.<sup>34</sup> This health risk accounted for 4 million deaths in 2015, mainly due to cardiovascular disease, and has a high rate of associated morbidity in adult life.<sup>34</sup> Measuring the prevalence of childhood obesity is crucial to track the trends of this health risk and establish public policies.

In Brazil, which has an emerging economy marked by high inequality, nationwide surveys to assess obesity, especially in the pediatric population, have irregular frequency. Discrepancies between Brazilian regions as well as effects of skin color and income were associated with the prevalence of childhood obesity in the most recent nationwide survey in 2009.<sup>35</sup> Since then, local studies have been carried out in different Brazilian cities and states,<sup>27</sup> but no summarized representative estimates are available.

A systematic review with a meta-analysis is a valuable tool in this scenario. Although some reviews to summarize the obesity prevalence in Brazilian children by these methods have been conducted, the findings have limited validity, mainly due to the lack of representativeness,<sup>28-32</sup> absence of quality assessment of primary studies,<sup>28 30 33</sup> and obsolete or irregular criteria for childhood obesity.<sup>28 33</sup> We aimed to assess the national prevalence of childhood obesity in Brazil by means of a systematic review and meta-analysis of representative studies.

**Methods**

***Protocol and registration***

The protocol containing the detailed methods of this systematic review was registered in the International prospective register of systematic reviews ([www.crd.york.ac.uk/prospero/display\\_record.php?ID=CRD42018091713](http://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42018091713))[APÊNDICE B].

***Eligibility criteria***

Observational or experimental representative studies that employed population or school-based sampling of children under 10 years old in Brazil were eligible. The prevalence of obesity in eligible studies relied on measured height and weight: studies with self-reported obesity were not eligible. Studies restricted to a particular ethnicity or social class were excluded.

### ***Information sources***

We searched the MEDLINE, EMBASE, Scopus, Web of Science, CINAHL, LILACS, SciELO, and Brazilian nationwide theses and dissertations (Brazilian Coordination for the Improvement of Higher Education Personnel and repositories of Brazilian universities with a postgraduate program of collective health and nutrition) databases.

There were no language or publication status restrictions. We screened the references of relevant publications to identify additional potentially eligible studies.

### ***Search***

The following search strategy was used for MEDLINE (via PubMed) and adapted for the other databases: ((children OR child OR pediatric OR infant OR kid OR baby OR neonate OR childhood) AND (obesity OR overweight OR obese) AND (prevalence OR prevalencia) AND (Brazil OR Brasil)), following the Peer Review of Electronic Search Strategies guidance [APÊNDICE C].<sup>36</sup> The search results in compatible formats were imported into the Covidence platform ([www.covidence.org](http://www.covidence.org)), for removing duplications and further review's steps. Searches were held in January 2018 and updated in September 2019.

### ***Study selection***

Independent paired researchers selected studies by screening titles and abstracts and then performing a full text assessment using the Covidence platform. A third reviewer arbitrated disagreement. For theses and dissertations, one reviewer screened the search results and eligibility was confirmed by a second researcher, using an Excel spreadsheet.

### ***Data collection process***

Data were extracted by two reviewers and independently confirmed by another using a standardized spreadsheet. Disagreements were resolved by a third reviewer. Study authors were contacted to obtain additional data if relevant data were not available in the reports or to clarify conflicting information included in different reports on the same study.

### ***Data items***

We extracted study data (author, data collection year, study design, sampling frame, publication type, and research location), population characteristics (age, sex, and number of children), and childhood obesity data of the total population and in each group, according to the World Health Organization (WHO) criteria for obesity in children from 0 to less than 5 years old<sup>37</sup> and from 5 to less than 10 years old.<sup>38</sup> For eligible studies that assessed obesity by different criteria, we either recalculated the prevalence from the original studies' datasets using the WHO growth criteria<sup>37 38</sup> or obtained new estimates that were as supplied by the authors.

### ***Risk of bias in individual studies***

Paired and independent researchers and confirmed by another, assessed the methodological quality of included studies using the checklist for prevalence data from the Joanna Briggs Institute,<sup>39</sup> consisting of the items: (i) sample frame (official source), (ii) sampling (probabilistic or universal sampling), (iii) sample size (statistically calculated), (iv) setting and participants description (appropriately described), (v) coverage of data analysis (adequate coverage for different age and sex subgroups), (vi) methods for outcome measurement (WHO growth criteria),<sup>37 38</sup> (vii) standardization of outcome measurement (weight and height measured by validated instruments), (viii) statistical analysis (analysis adjusted or with sample weighting), and (ix) response rate (low rate of refusals and losses). Reviewers assigned 1 point for each item attended by the studies, with a maximum score of 9 per study.

### ***Summary measures***

The primary outcome was the prevalence of childhood obesity and 95% confidence intervals (95% CIs). Secondary outcomes included the prevalence of childhood obesity in girls, boys, age groups, decade and Brazilian geographic regions (North, Northeast, Midwest, Southeast and South).

### ***Synthesis of results and additional analyses***

We used Stata (version 14.2) for all statistical analysis. Meta-analysis of proportions were calculated with Freeman-Tukey double arcsine transformation<sup>40</sup> (metaprop command, ftt option) and weighted according to the official population size obtained from the Brazilian Institute of Geography and Statistics for each period and location of the primary studies. Heterogeneity was estimated by the assessment of inconsistency between studies ( $I^2$ ) and chi-squared tests, with a significance level of  $p < 0.10$ .

Publication bias was assessed by funnel plot asymmetry evaluation and Egger's test (significance level of  $p < 0.05$ ).<sup>41</sup> Meta-regressions were calculated using the modified Knapp-Hartung method<sup>42</sup> to investigate the effects of independent variables (age, region, year, and quality score) on the variability of obesity prevalence between studies.

## **Results**

### ***Study characteristics***

Out of 9,394 retrieved records, 567 were assessed in full text, and 143 reports from 53 studies were included in the analysis (Figure 1).<sup>43-93</sup> The references of all reports of included studies

is listed in Supplementary Material Appendix 1 and the reason for exclusion of the 222 studies assessed for data extraction is listed in Supplementary Material Appendix 2.

In total, 122,395 children were assessed in studies conducted between 1986 and 2015. Most of the studies were cross-sectional and school-based, conducted in the South and Southeast regions, and included children aged 6-9 years old (Table 1). Studies were limited mainly due to inadequate response rates, poor subject description and inappropriate statistical analyses. The quality assessment score ranged from 3 to 9 with a median of 7. The individual characteristics of each included studies is depicted in Supplementary Material Appendix 3. Upon our request from authors, 36 studies sent additional data to allow proper quantitative synthesis.

### ***Childhood obesity prevalence***

The prevalence of childhood obesity was ([95% CI]: 8.1-8.4%,  $I^2 = 98.5\%$ ), and lower in girls (7.3% [7.1-7.5%],  $I^2 = 96.1\%$ ) than in boys (9.7% [9.4-9.9%],  $I^2 = 97.4\%$ ). Increasing trends in the obesity prevalence according to decade and age group were observed (Figure 2).

The highest prevalence rates of obesity were noted in the South (10.1% [9.7-10.4%],  $I^2 = 97.7\%$ ) and Southeast (10.6% [10.2-11.0%],  $I^2 = 98.2\%$ ) regions. Slightly lower obesity prevalence was observed in cross-sectional studies than in cohort studies, as well as in population-based studies than in school-based studies (Table 2).

### ***Investigation of heterogeneity and publication bias***

The variability in the obesity prevalence was significantly affected by the children's age group ( $p < 0.001$ ; residual  $I^2 = 56.4\%$ ), Brazilian region ( $p = 0.018$ ; residual  $I^2 = 63.4\%$ ), but not by the year of research ( $p = 0.051$ ; residual  $I^2 = 71.2\%$ ), and the methodological quality score of the studies ( $p = 0.256$ ; residual  $I^2 = 72.6\%$ ) (Figure 3). A symmetric distribution was noted in the funnel plot, without evidence of a small studies effect on childhood obesity ( $p = 0.746$ ) (Figure 4).

## **Discussion**

For every 100 Brazilian children, more than eight children are obese according to this systematic review and meta-analysis of representative studies. Obesity was slightly more frequent in boys than in girls, and all estimates had high heterogeneity. The prevalence increased with age, decade, and Brazilian regions, partially explaining the high variability across studies.

The results were highly inconsistent among studies, which is a common limitation in meta-analysis of prevalence.<sup>94</sup> Subgroup analyses according to factors that significantly affected

heterogeneity did not lead to more homogeneous estimates. Estimates were calculated from studies with population representativeness that used the same official criteria for assessing obesity in the Brazilian pediatric population.<sup>37 38</sup>

Boys had a slightly higher prevalence of obesity than girls in Brazil; this pattern was similar to those in Latin American and Caribbean regions in 2016, with 13% of obesity in boys and 10% in girls aged 5 to 19 years,<sup>95</sup> and in countries with a high-middle sociodemographic index according to the worldwide burden of obesity in 2015; however, this pattern was not observed in the overall childhood estimate.<sup>34</sup> An inverse association was observed in a systematic review of Australian studies conducted between 1967 and 2012, with a higher prevalence of combined overweight and obesity in girls (21%) than in boys (18%) aged 2 to 18 years.<sup>96</sup>

The age-standardized mean body mass index of children and adolescents increased globally from 1975 to 2016 (an increase of 0.32 kg/m<sup>2</sup> per decade for girls and 0.40 kg/m<sup>2</sup> per decade for boys).<sup>97</sup> Projections of global childhood obesity estimated that 5.4 % of the population aged 5-18 years will be obese by 2025, a 0.5% increase relative to 2013.<sup>98</sup> This trend seems to be influenced by human development in the region. Inverse associations between socioeconomic status and overweight and obesity were observed in a systematic review of 30 studies.<sup>99</sup> In Spain, a cohort study including 1.1 million children showed a slight reduction in childhood excess weight, from 42% in 2006 to 40% in 2016,<sup>100</sup> indicating the possible lower influence of time in highly developed regions.

The highest obesity prevalence was observed in the most economically developed Brazilian region, which also comprised the largest number of investigations. A bibliometric analysis of scientific obesity research studies from 1988-2007 revealed this tendency in few publications from Latin America in relation to more developed countries.<sup>101</sup> A positive association between a high obesity prevalence and the number of publications was observed and may explain our findings.<sup>101</sup> The nutritional transition to the consumption of ultra-processed foods, which accounted for approximately 40% of the total daily intake in children aged 6 years in a birth cohort in southern Brazil,<sup>102</sup> compared to a cohort in the city of São Luís (Northeast region), estimated in 26% of total calories of children up to 3 years old in 2007.<sup>103</sup>

Cohort studies reported a higher prevalence rates than cross-sectional studies, even though the latter were more frequent. Cohort studies are expensive due to the time required for follow-up and the large sample size, a possible explanation for lower number of studies included, and are more prone to losses of follow-up than other types of studies.<sup>104</sup>

School-based studies had a higher prevalence and were more common than population-based studies, possibly due to more convenient logistic in recruiting and data collection of children. Absenteeism during data collection in school-based research studies may explain higher prevalence observed. An analysis of 1,069 students in fourth to sixth grade in nine public elementary schools in Philadelphia in a published 2007, reported that children with obesity were absent ( $12.2 \pm 11.7$  days) more frequently than healthy children ( $10.1 \pm 10.5$  days),<sup>105</sup> showing a possible difference in school attendance that could result in selection bias. In Brazil, absenteeism and the lack of universal education for children can effect economic crises and increasing poverty, and resulted in an increase in male child labor in 2015 compared to 2013 in both in rural and urban areas.<sup>106</sup>

### **Conclusion**

Over eight out of every 100 Brazilian children up to 10 years old had obesity in this comprehensive analysis of representative studies. Obesity was higher in boys than in girls and increased with age, decade, and in more developed Brazilian regions. Further investigation should take into account underling factors such as dietary patterns and inequalities across Brazilian regions.

The authors thank Raisa Rafaela Santos de Gusmão for the contribution in piloting of the selection and data extraction of studies, and the authors of eligible manuscripts for providing data or clarification upon our requested: Adriana Paula Silva, Alanderson A. Ramalho, Alessandra Doumid Borges Pretto, Alessandra Vitorino Naghettini, Alynne Christian Ribeiro Andaki, Ana Flavia Granville-Garcia, Ana Mayra A. de Oliveira, Ana Paula Carlos Cândido Mendes, Anna Christina Barreto, Anne Jardim-Botelho, Barbara H. Lourenço, Carla de

Oliveira Bernardo, Cassiano Ricardo Rech, Cézane Priscila Reuter, Denise Petrucci Gigante, Deysianne Costa das Chagas, Diego Moura Tanajura, Doroteia Aparecida Höfelman, Elenir Rose Jardim Cury Pontes, Elma Izze da Silva Magalhães, Emil Kupek, Fabian Calixto Fraiz, Felipe S. Neves, Gabriella Bettioli Feltrin, Gerson Luis de Moraes Ferrari, Haroldo da Silva Ferreira, Ida Helena Carvalho Francescantonio Menezes, Jéssica Pedroso, Julia Khede Dourado Vila, Juliane Berria, Lana do Monte Paula Brasil, Larissa da Cunha Feio Costa, Leonardo Pozza Santos, Lucia Yassue Tutui Nogueira, Luciana Neri Nobre, Marcela de França Verçosa, Marcos Britto Correa, Marcos Pascoal Pattussi, Maria Luiza Kraft, Maria Wany Louzada Strufaldi, Naruna Pereira Rocha, Nilton Rosini, Patrícia Casagrande Dias de Almeida, Paula Azevedo Aranha Crispim, Peter Katzmarzyk, Rosângela de Mattos Müller, Ruth Liane Henn, Samuel Carvalho Dumith, Silvia Diez Castilho, Sílvia Letícia Alexius, Silvia Nascimento de Freitas, Silvia Regina Dias Medici Saldiva, Simone Augusta Ribas, Suélen Henriques da Cruz, Valter Cordeiro Barbosa Filho, Wendell Bila.

## Figures

Figure 1. Process of selection and inclusion of studies in the systematic review [APÊNDICE D e E].

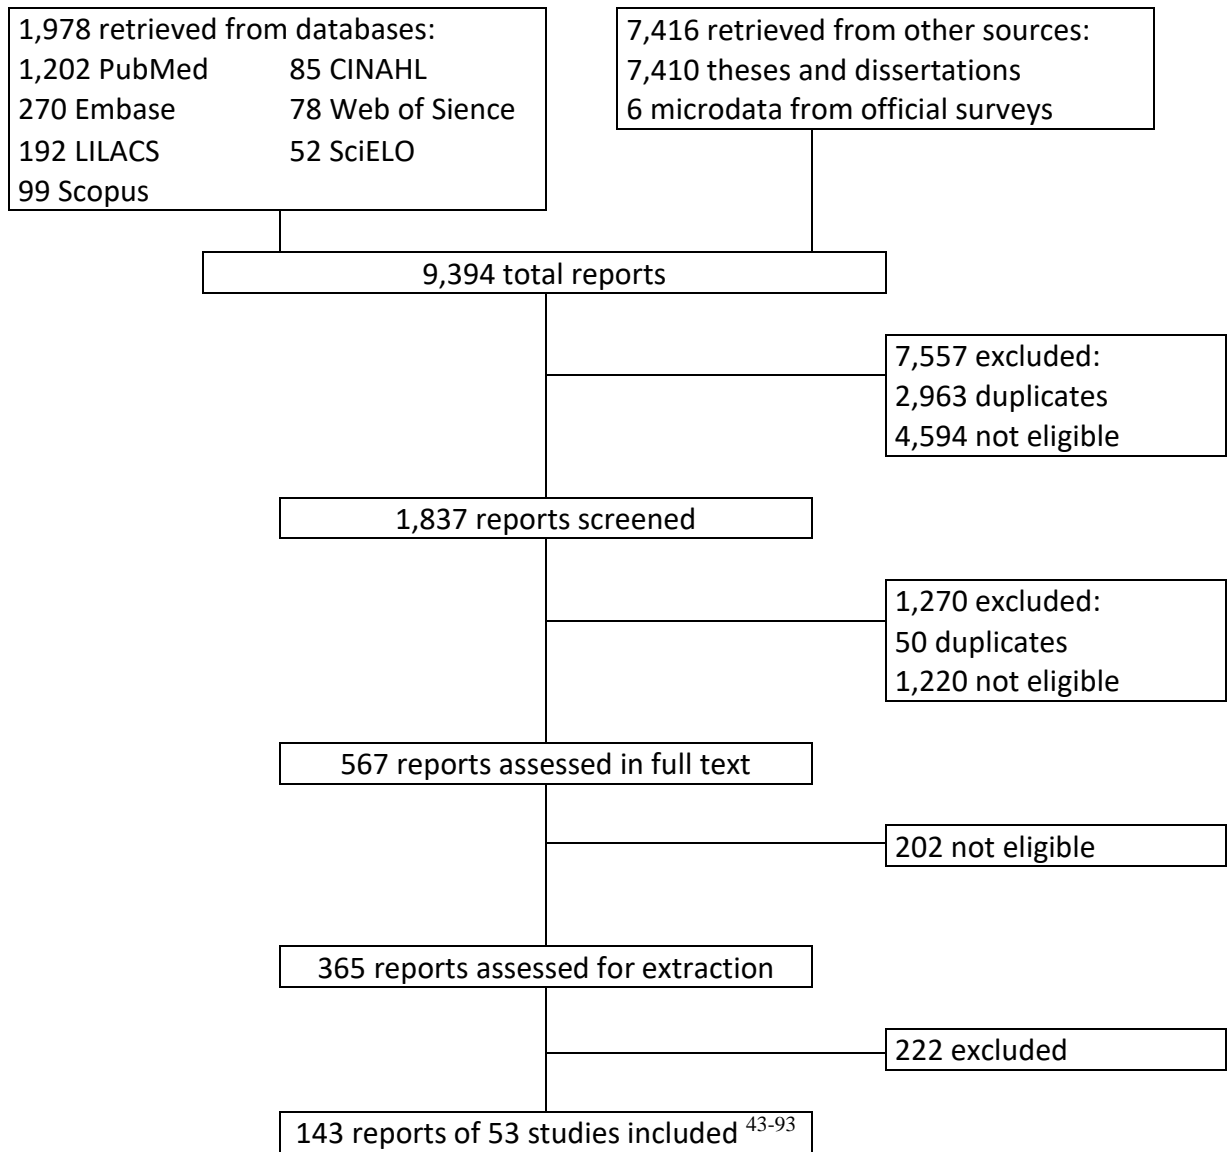

Figure 2. Prevalence of obesity in total and by sex, decade and aged group

Figure 3. Prevalence of obesity in included studies by children age group, Brazilian region, year of research and quality score (study size is represented by the circle size)

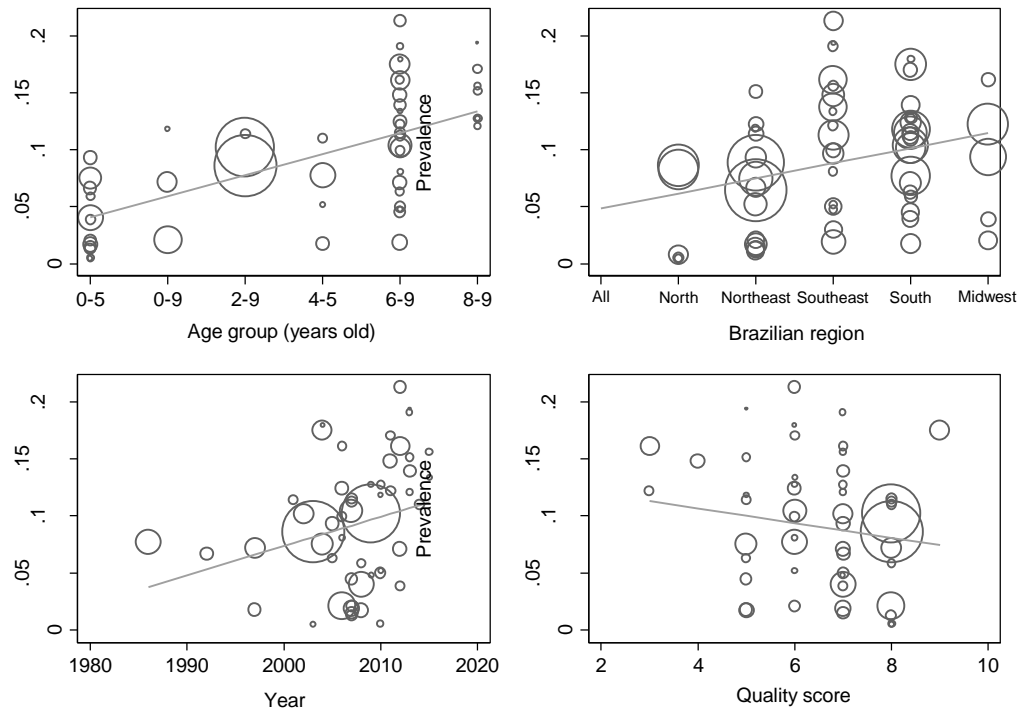

Figure 4. Prevalence of obesity in each study distributed according to the standard error of the prevalence

## Tables

Table 1. Characteristics of included studies

Characteristics	No of studies	No of children
Total	53	122,395
Age group (years)		
0-9	3	9,134
0-5	12	17,600
4-5	4	6,897
2-9	3	56,654
6-9	23	28,786
8-9	8	3,324
Study		
Cross-sectional	49	112,688
Cohort	4	9,707
Sample source		
School-based		
Public and private	26	27,530
Public	7	6,421
Population-based		
Household	15	78,505
Maternity	5	9,939
Region		
Brazil	5	69,713
North	2	577
Northeast	11	13,147
Southeast	14	10,711
South	19	26,985
Midwest	2	1,262
Decade		
1990s <sup>a</sup>	4	10,313
2000s	29	97,413
2010s	20	14,669
Limitations in methodological quality		
Sample frame	1	1,640
Sampling	11	10,390
Sample size	6	4,687
Setting and participants description	30	40,278
Coverage of data analysis	12	8,992
Method for outcome measurement	16	23,355
Standardization of outcome measurement	1	713
Statistical analysis	17	20,191
Response rate	42	112,279

<sup>a</sup> includes one study held in 1986

Table 2. Prevalence of childhood obesity, 95% confidence interval (CI) and heterogeneity ( $I^2$ ) according to the study design, sample source and region of studies

Subgroup	No of studies	No of children	Prevalence, % [95% CI]	$I^2$ (%)
<b>Study desing</b>				
Cross-sectional	48	112,023	8.1 [7.9-8.2]	98.3
Cohort	4	9,707	9.7 [8.9-10.6]	99.2
<b>Sample source</b>				
<b>School-based</b>				
Public and private schools	25	26,865	9.7 [9.3-10.1]	97.0
Public schools	7	6,421	12.6 [11.7-13.4]	93.0
<b>Population-based</b>				
Household	15	78,505	7.3 [7.1-7.5]	99.0
Maternity	5	9,939	9.5 [8.7-10.4]	99.0
<b>Region<sup>a</sup></b>				
North	5	12,443	6.7 [6.3-7.2]	98.8
Northeast	15	38,193	6.4 [6.2-6.7]	98.1
Southeast	18	18,497	10.6 [10.2-11.0]	98.2
South	21	35,230	10.1 [9.7-10.4]	97.7
Midwest	5	11,805	9.7 [9.1-10.2]	98.1

<sup>a</sup> the analysis included disaggregated data from each region if available in a nationwide study

<sup>a</sup> Study included only girls.

### **3. Conclusão**

A cada 100 crianças até 10 anos de idade, 8 apresentaram obesidade de acordo com pesquisas representativas realizadas no país. A obesidade foi maior em meninos do que em meninas, entre a faixa etária de 6 a 9 anos, nas regiões Sul e Sudeste do Brasil, principalmente entre as décadas de 2000 e 2010. A obesidade infantil aumentou nos últimos anos, nas regiões mais desenvolvidas do País ao longo dos anos e nas crianças mais velhas. Uma investigação mais aprofundada de cada fator subjacente, como padrões alimentares, desigualdades entre as regiões brasileiras e fatores sociais, pode explicar as variações observadas. As estimativas não apresentam suspeita de ausência de estudos publicados (viés de publicação) e possivelmente refletem a estimativa mais fidedigna disponível para embasar políticas públicas do Sistema Único de Saúde.

Title: Prevalence of childhood obesity in Brazil: a systematic review and meta-analysis

Corresponding Author: Prof. Tais F Galvao

Co-Authors: Carolina Muller Ferreira, BPharm, MSc candidate; Natália Dutra dos Reis, BPharm; Andresa de Oliveira Castro, BPharm student; Dorotéia Aparecida Hofelmann, RD, MSc, PhD; Kátia Kodaira, BPharm, MSc, PhD candidate; Marcus Tolentino Silva, BPharm, MSc, PhD

Manuscript Number: JPEDIATRIA-D-20-00255

Dear Carolina Muller Ferreira,

Prof. Tais F Galvao submitted this manuscript via Elsevier's online submission system, Editorial Manager, and you have been listed as a Co-Author of this submission.

Elsevier asks Co-Authors to confirm their consent to be listed as Co-Author and track the papers status. In order to confirm your connection to this submission, please click here to confirm your co-authorship:

<https://www.editorialmanager.com/jpediatria/l.asp?i=74634&l=Z1KU5NYO>

If you have not yet registered for the journal on Editorial Manager, you will need to create an account to complete this confirmation. Once your account is set up and you have confirmed your status as Co-Author of the submission, you will be able to view and track the status of the submission as it goes through the editorial process by logging in at

<https://www.editorialmanager.com/jpediatria/>

If you did not co-author this submission, please contact the Corresponding Author directly at [taisgalvao@gmail.com](mailto:taisgalvao@gmail.com)

Thank you,

Jornal de Pediatria

Prevalence of childhood obesity in Brazil: a systematic review and meta-analysis

*Tais Galvao, Carolina Muller, Andresa Castro, Raisa Gusmao, Natalia Reis, Doroteia Aparecida Höfelmann, Marcus Tolentino Silva*

### Citation

Tais Galvao, Carolina Muller, Andresa Castro, Raisa Gusmao, Natalia Reis, Doroteia Aparecida Höfelmann, Marcus Tolentino Silva. Prevalence of childhood obesity in Brazil: a systematic review and meta-analysis. PROSPERO 2018 CRD42018091713 Available from: [https://www.crd.york.ac.uk/prospero/display\\_record.php?ID=CRD42018091713](https://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42018091713)

### Review question

What is the prevalence of child obesity in Brazil by age groups and macro-regions?

### Searches

We will search the following electronic bibliographic databases: MEDical Literature Analysis and Retrieval System Online (MEDLINE), Excerpta Medica Database (EMBASE), Scopus, Web of Science, Cumulative Index to Nursing and Allied Health Literature (CINAHL), Literatura Latino-Americana e do Caribe em Ciências da Saúde (LILACS), Scientific Electronic Library Online (SciELO).

No restrictions will be applied on publication date, language or status.

Available Microdata from National Studies/Statistics that resulted from age groups of interest will also be searched, for example, Pesquisa de Orçamentos Familiares (POF), Pesquisa Nacional de Demografia e Saúde (PNDS) and others studies identified through manual searches and contact with specialists.

The references from the included studies and relevant publications in the area of this review will be scrutinized to identify potentially eligible studies. Grey literature will be identified through the search of repositories of thesis and dissertations.

A prior search strategy was elaborated in MEDLINE (via PubMed): ("pediatric obesity"[MeSH] OR ((obesity OR overweight OR obese) AND (children OR child OR pediatric OR infant OR kid OR baby OR neonate OR childhood))) AND (prevalence OR prevalencia) AND (Brazil OR Brasil).

The strategy approved following Peer Review of Electronic Search Strategies (PRESS) recommendation was adapted for the other bases described in the project.

### Types of study to be included

We will include observational or experimental studies population-based or school-based with regional or/and national representativeness.

### Condition or domain being studied

Childhood obesity as defined by the World Health Organization.

## Participants/population

We will include studies that report prevalence of obesity and overweight of Brazilian children aged from 0-10 years old. There are no restrictions on demographic characteristics.

### Intervention(s), exposure(s)

The focus of the review is to determine the prevalence of childhood obesity in Brazil.

## Comparator(s)/control

There is no control group in this review.

## Context

Studies must have been conducted with representative sampling and must have the definition of childhood obesity derived from weight and height measurement (reporting of weight and height of the child will not be

considered). Assessment of child obesity in the studies should have been performed according to World Health Organization (WHO) and adopted by the Ministry of Health for the Brazilian population. Studies using other criteria whose microdata are available will be eligible since they allow classification of individual data according to the adopted standard. Studies related to other diseases but that have data eligible for this research (height and weight measurements) will be included. Adult cutoff points of Body Mass Index (weight [kg]/square height [m<sup>2</sup>]), adiposity assessment by skinfold measurements and other body fat measurements and percentiles from Centers for Disease Control and Prevention will not be considered for reasons of validity and reproducibility.

## Main outcome(s)

Prevalence of childhood obesity.

## Additional outcome(s)

Prevalence of childhood obesity in Brazil by age groups, macro-regions and sex. Time trend of childhood obesity in Brazil.

## Data extraction (selection and coding)

Abstracts of studies retrieved using the search strategy and from the additional sources mentioned in Searches will be screened by team members trained in pairs, who will independently select the studies based on the eligibility criteria. Duplicate articles will be identified and removed. Next, full texts will be screened by two review team members. Disagreements will be resolved by a third researcher, the project coordinator. The Covidence platform ([www.covidence.org](http://www.covidence.org)) will be used at this stage.

Data will be extracted in a previously standardized Excel's worksheet. Extraction will be performed by a reviewer and confirmed by another. Discordances will be solved by consensus. Any missing or additional required data will be requested from the corresponding authors on the individual studies.

Data extracted will be:

- (1) Characteristics of the study: author, design, year and place of the research;
- (2) Characteristics of the population: age group included, sociodemographic variables, total of participants and proportion by sex and age;
- (3) Outcome: criterion used for assessing obesity, number of participants with obesity in total and in each group (sex and age), denominator of each obesity assessment.

## Risk of bias (quality) assessment

We will use the Joanna Briggs Institute critical evaluation checklist of studies with prevalence data. One reviewer will assess and another will confirm the quality assessment. Discordances will be solved by consensus.

This tool consists of 9 critical evaluation items:

- (1) Has the source of the sampling list been appropriate to address the target population?
- (2) Were the study participants adequately sampled?
- (3) Was the sample size adequate?
- (4) Were the study participants and context described in detail?
- (5) Was the data analysis conducted with sufficient coverage of the identified sample?
- (6) Were valid methods used to identify the outcome?
- (7) Was the outcome measured in a standardized and reliable manner for all participants?
- (8) Was the statistical analysis appropriate?
- (9) Was the response rate adequate and, if not, was it adequately managed?

## Strategy for data synthesis

We plan to use aggregate participant data and a quantitative synthesis approach. Results will be presented with 95% confidence intervals and meta-analysis to estimate prevalence of childhood obesity in the Brazilian population.

Prevalence of time intervals of 5 to 10 years of publication (or relevant intervals according to the availability of extracted data) will also be calculated to assess the time trend of childhood obesity.

Stata statistical software version 14.2 will be used to analyze data by two approaches: (1) metaprop command to group proportions of studies in meta-analysis, with score-based or exact binomial CI, assuming that population and sample sizes of the studies are correlated. (2) Transformation of Freeman-Tukey double arcsine to stabilize variances.

Heterogeneity will be evaluated through the  $\chi^2$  test, adopting the level of significance of  $p < 0.10$ . The  $I^2$  statistic will also be used to evaluate the degree of heterogeneity between studies. The sources of inconsistency between the results of the studies will be explored through meta-regressions and subgroup analyzes. Meta-regressions will be calculated by the modified Knapp-Hartung method.

Socioeconomic characteristics of the region in which each study was conducted will be obtained and explored in meta-regressions, including indicators of inequality and development.

The presence of effects from small studies will be observed through asymmetry of the funnel graph and calculation of the Egger test, adopting the level of significance of  $p < 0.05$ .

## Analysis of subgroups or subsets

In the subgroup analyzes, only studies with similar characteristics in the variables available for evaluation in the change of prevalence and heterogeneity will be included in the meta-analysis. We plan to examine estimates of prevalence stratification by:

- Age groups (0-23 months, 2-5 years, 5-9 years and other ranges according to the availability of data);
- Sex (male and female);
- Brazilian macro regions (North, Northeast, Midwest, Southeast and South).

#### Research Question

(Describe the purpose of the search)

*[mandatory]*

Qual a prevalência de obesidade infantil (crianças menores de 10 anos) no Brasil e macrorregiões do País?
---

**PICO Format**

(Outline the PICOs for your question— i.e., Patient, Index test, Reference standard, Outcome, and Study Design — as applicable)

<b>P</b>	Crianças (menores de 10 anos)
<b>I</b>	Obesidade, sobrepeso
<b>C</b>	-
<b>O</b>	Prevalência no Brasil e macrorregiões
<b>S</b>	Estudos de base populacional ou de base escolar com representatividade regional

**Inclusion Criteria** (List criteria such as age groups, study designs, etc., to be included)

*[optional]*

Pacientes com obesidade infantil (<10 anos) pela análise da relação peso e altura, avaliados em estudos de base populacional e escolar com representatividade regional e/ou nacional com foco restrito no Brasil.

**Exclusion Criteria** (List criteria such as study designs, date limits, etc., to be excluded)

*[optional]*

Pacientes adolescentes e adultos, cujo reporte de obesidade não é realizado por aferição de peso e altura. Exclusão de estudos nos quais se encaixem como casos reportados, e que analisam a relação da obesidade com adiposidade cutânea. Também serão desconsiderados estudos que não demonstrem a prevalência e que sejam como em outros Países/Regiões.

**Was a search filter applied?**

Yes  No

**If YES, which one(s) (e.g., Cochrane RCT filter, PubMed Clinical Queries filter)?**

**Provide the source if this is a published filter.** *[mandatory if YES to previous question — textbox]*

Other notes or comments you feel would be useful for the peer reviewer? *[optional]*

Sinônimo que pode ser inserido: Newborn

Please copy and paste your search strategy here, exactly as run, including the number of hits per line. *[mandatory]*

#### DESCRIPTION

*Jornal de Pediatria* is a bimonthly publication of the Brazilian Society of Pediatrics (Sociedade Brasileira de Pediatria, SBP). It has been published without interruption since 1934. *Jornal de Pediatria* publishes original articles and review articles covering various areas in the field of pediatrics. By publishing relevant scientific contributions, *Jornal de Pediatria* aims at improving the standards of pediatrics and of the healthcare provided for children and adolescents in general, as well to foster debate about health.

#### IMPACT FACTOR

2019: 2.029 © Clarivate Analytics Journal Citation Reports 2020

## GUIDE FOR AUTHORS

---

### Types of article

*Jornal de Pediatria* accepts submissions of original articles, review articles, and letters to the editor.

**Original articles** include reports on controlled and randomized studies, screening and diagnostic studies, and other descriptive and intervention studies, as well as reports on basic research carried out with laboratory animals (see section **Results of Clinical Trials**). Manuscripts in this category should not exceed 3,000 words (excluding front page, references and tables), 30 references and four tables and figures. Please access <http://www.equator-network.org/> for further information on how to publish this type of article.

**Review articles** are meta-analysis, systematic or critical assessments of the literature concerning topics of clinical relevance, with emphasis on aspects such as cause and prevention of diseases, diagnosis, treatment, and prognosis. Review articles should not exceed 6,000 words (excluding front page, references and tables) and a minimum of 30 up-to-date references should be cited. Usually, professionals of recognized expertise are invited to write review articles. Meta-analyses are included in this category. *Jornal de Pediatria* will also consider unsolicited review articles. Please contact [assessoria@jped.com.br](mailto:assessoria@jped.com.br) to submit a draft to the Editorial Board before sending the full review article. Please access <http://www.equator-network.org/> for further information on how to publish this type of article.

**Letters to the editor** usually express an opinion, discuss or criticize articles previously published in *Jornal de Pediatria*. Letters should not exceed 1,000 words and six references. Whenever possible, a response from the authors of the article to which the letter refers will be published along with the letter.

**Editorials and comments**, which usually make reference to selected articles, are solicited from experts in the field. The Editorial Board may consider the publication of unsolicited comments, as long as the authors send a draft to the Editorial Board before sending the full text.

### Language

As of December 9th, 2019, papers must be submitted in English, as they will be published in English (html and pdf). American spelling is used.

### Submission checklist

You can use this list to carry out a final check of your submission before you send it to the journal for review. Please check the relevant section in this Guide for Authors for more details.

#### Ensure that the following items are present:

One author has been designated as the corresponding author with contact details: E-mail address; Full postal address;

All necessary files have been uploaded:

#### Manuscript:

Include keywords

All figures (include relevant captions)

All tables (including titles, description, footnotes)

Ensure all figure and table citations in the text match the files provided

Supplemental files (where applicable)

#### Further considerations

Manuscript has been 'spell checked' and 'grammar checked'

All references mentioned in the Reference List are cited in the text, and vice versa

Permission has been obtained for use of copyrighted material from other sources (including the Internet)

Relevant declarations of interest have been made

Journal policies detailed in this guide have been reviewed.

For further information, visit our [Support Center](#).

## BEFORE YOU BEGIN

### *Ethics in publishing*

Please see our information pages on [Ethics in publishing](#) and [Ethical guidelines for journal publication](#).

### *Declaration of interest*

All authors must disclose any financial and personal relationships with other people or organizations that could inappropriately influence (bias) their work. Examples of potential competing interests include employment, consultancies, stock ownership, honoraria, paid expert testimony, patent applications/registrations, and grants or other funding. If there are no interests to declare then please state this: 'Declarations of interest: none'. [More information](#).

### *Submission declaration and verification*

Submission of an article implies that the work described has not been published previously (except in the form of an abstract, a published lecture or academic thesis, see '[Multiple, redundant or concurrent publication](#)' for more information), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. To verify originality, your article may be checked by the originality detection service [Crossref Similarity Check](#).

### *Use of inclusive language*

Inclusive language acknowledges diversity, conveys respect to all people, is sensitive to differences, and promotes equal opportunities. Content should make no assumptions about the beliefs or commitments of any reader; contain nothing which might imply that one individual is superior to another on the grounds of age, gender, race, ethnicity, culture, sexual orientation, disability or health condition; and use inclusive language throughout. Authors should ensure that writing is free from bias, stereotypes, slang, reference to dominant culture and/or cultural assumptions. We advise to seek gender neutrality by using plural nouns ("clinicians, patients/clients") as default/wherever possible to avoid using "he, she," or "he/she." We recommend avoiding the use of descriptors that refer to personal attributes such as age, gender, race, ethnicity, culture, sexual orientation, disability or health condition unless they are relevant and valid. These guidelines are meant as a point of reference to help identify appropriate language but are by no means exhaustive or definitive.

### *Contributors*

Each author is required to declare his or her individual contribution to the article: all authors must have materially participated in the research and/or article preparation, so roles for all authors should be described. The statement that all authors have approved the final article should be true and included in the disclosure.

### *Authorship*

All authors should have made substantial contributions to all of the following: (1) the conception and design of the study, or acquisition of data, or analysis and interpretation of data, (2) drafting the article or revising it critically for important intellectual content, (3) final approval of the version to be submitted.

### *Changes to authorship*

Authors are expected to consider carefully the list and order of authors **before** submitting their manuscript and provide the definitive list of authors at the time of the original submission. Any addition, deletion or rearrangement of author names in the authorship list should be made only **before** the manuscript has been accepted and only if approved by the journal Editor. To request such a change, the Editor must receive the following from the **corresponding author**: (a) the reason for the change in author list and (b) written confirmation (e-mail, letter) from all authors that they agree with the addition, removal or rearrangement. In the case of addition or removal of authors, this includes confirmation from the author being added or removed.

Only in exceptional circumstances will the Editor consider the addition, deletion or rearrangement of authors **after** the manuscript has been accepted. While the Editor considers the request, publication of the manuscript will be suspended. If the manuscript has already been published in an online issue, any requests approved by the Editor will result in a corrigendum.

### **Clinical trial results**

A clinical trial is defined as any research study that prospectively assigns human participants or groups of humans to one or more health-related interventions to evaluate the effects of health outcomes. Health-related interventions include any intervention used to modify a biomedical or health-related outcome (for example drugs, surgical procedures, devices, behavioural treatments, dietary interventions, and process-of-care changes). Health outcomes include any biomedical or health-related measures obtained in patients or participants, including pharmacokinetic measures and adverse events.

In line with the position of the International Committee of Medical Journal Editors, the journal will not consider results posted in the same clinical trials registry in which primary registration resides to be prior publication if the results posted are presented in the form of a brief structured (less than 500 words) abstract or table. However, divulging results in other circumstances (e.g., investors' meetings) is discouraged and may jeopardise consideration of the manuscript. Authors should fully disclose all posting in registries of results of the same or closely related work.

#### *Reporting clinical trials*

Randomized controlled trials should be presented according to the CONSORT guidelines. At manuscript submission, authors must provide the CONSORT checklist accompanied by a flow diagram that illustrates the progress of patients through the trial, including recruitment, enrollment, randomization, withdrawal and completion, and a detailed description of the randomization procedure. The <http://www.consort-statement.org> CONSORT checklist and template flow diagram are available at: <http://www.consort-statement.org>. Please access <http://www.equator-network.org/> for further information on how to publish this type of article.

#### *Registration of clinical trials*

Registration in a public trials registry is a condition for publication of clinical trials in this journal in accordance with [International Committee of Medical Journal Editors](#) recommendations. Trials must register at or before the onset of patient enrolment. The clinical trial registration number should be included at the end of the abstract of the article. Purely observational studies (those in which the assignment of the medical intervention is not at the discretion of the investigator) will not require registration.

### **Copyright**

Upon acceptance of an article, authors will be asked to complete a 'Journal Publishing Agreement' (see [more information](#) on this) to assign to the Brazilian Society of Pediatrics (Sociedade Brasileira de Pediatria – SBP) the copyright in the manuscript and any tables, illustrations or other material submitted for publication as part of the manuscript (the "Article") in all forms and media (whether now known or later developed), throughout the world, in all languages, for the full term of copyright, effective when the Article is accepted for publication. . An e-mail will be sent to the corresponding author confirming receipt of the manuscript together with a 'Journal Publishing Agreement' form or a link to the online version of this agreement.

### **Author rights**

As an author you (or your employer or institution) have certain rights to reuse your work. [More information](#).

#### *Elsevier supports responsible sharing*

Find out how you can [share your research](#) published in Elsevier journals.

### **Role of the funding source**

You are requested to identify who provided financial support for the conduct of the research and/or preparation of the article and to briefly describe the role of the sponsor(s), if any, in study design; in the collection, analysis and interpretation of data; in the writing of the report; and in the decision to submit the article for publication. If the funding source(s) had no such involvement then this should be stated.

### **Open access**

Please visit our [Open Access page](#) for more information.

#### *Elsevier Researcher Academy*

[Researcher Academy](#) is a free e-learning platform designed to support early and mid-career researchers throughout their research journey. The "Learn" environment at Researcher Academy offers several interactive modules, webinars, downloadable guides and resources to guide you through the process of writing for research and going through peer review. Feel free to use these free resources to improve your submission and navigate the publication process with ease.

#### *Language (usage and editing services)*

Please write your text in good English (American English is used). Authors who feel their English language manuscript may require editing to eliminate possible grammatical or spelling errors and to conform to correct scientific English may wish to use the [English Language Editing service](#) available from Elsevier's WebShop.

#### **Informed consent and patient details**

Studies on patients or volunteers require ethics committee approval and informed consent, which must be documented in the paper. Appropriate consents, permissions and releases must be obtained where an author wishes to include case details or other personal information or images of patients and any other individuals in an Elsevier publication. Written consents must be retained by the author and copies of the consents or evidence that such consents have been obtained must be provided to Elsevier on request. For more information, please review the [Elsevier Policy on the Use of Images or Personal Information of Patients or other Individuals](#). Unless you have written permission from the patient (or, where applicable, the next of kin), the personal details of any patient included in any part of the article and in any supplementary materials (including all illustrations and videos) must be removed before submission.

#### **Submission**

Our online submission system guides you stepwise through the process of entering your article details and uploading your files. The system converts your article files to a single PDF file used in the peer-review process. Editable files (e.g., Word, LaTeX) are required to typeset your article for final publication. All correspondence, including notification of the Editor's decision and requests for revision, is sent by e-mail.

#### *Submit your article*

Please submit your article via <https://www.evise.com/profile/api/navigate/JPED>.

### **PREPARATION**

#### **Double-blind review**

This journal uses double-blind review, which means the identities of the authors are concealed from the reviewers, and vice versa. [More information](#) is available on our website. To facilitate this, please include the following separately:

*Title page (with author details):* This should include the title, authors' names, affiliations, acknowledgements and any Declaration of Interest statement, and a complete address for the corresponding author including an e-mail address.

*Blinded manuscript (no author details):* The main body of the paper (including the references, figures, tables and any acknowledgements) should not include any identifying information, such as the authors' names or affiliations.

#### *Use of word processing software*

It is important that the file be saved in the native format of the word processor used. The text should be in single-column format. Keep the layout of the text as simple as possible. Most formatting codes will be removed and replaced on processing the article. In particular, do not use the word processor's options to justify text or to hyphenate words. However, do use bold face, italics, subscripts, superscripts etc. When preparing tables, if you are using a table grid, use only one grid for each individual table and not a grid for each row. If no grid is used, use tabs, not spaces, to align columns. The electronic text should be prepared in a way very similar to that of conventional manuscripts (see also the [Guide to Publishing with Elsevier](#)). Note that source files of figures, tables and text graphics will be required whether or not you embed your figures in the text. See also the section on Electronic artwork.

To avoid unnecessary errors you are strongly advised to use the 'spell-check' and 'grammar-check' functions of your word processor.

#### **Article structure**

#### *Subdivision - unnumbered sections*

The main text in **original articles** should contain the following sections, indicated by a subtitle: Introduction, Methods, Results, and Discussion.

The sections in **review articles** may vary depending on the topic. We suggest that authors include a brief introduction, in which they explain (from the perspective of the medical literature) the importance of the review for the practice of pediatrics. It is not necessary to describe how data were selected and collected. The conclusions section should correlate the main ideas in the review to possible clinical applications, keeping generalizations within the scope of the subject under review.

#### *Introduction*

State the objectives of the work and provide an adequate background, avoiding a detailed literature survey or a summary of the results. Make it brief, including only references that are strictly relevant to underscore the importance of the topic and to justify the study. At the end of the introduction, research objectives must be clearly stated.

#### *Material and methods*

Provide sufficient detail to allow the work to be reproduced. Methods already published should be indicated by a reference: only relevant modifications should be described. This section should describe the study population, the sample being analyzed, and the selection criteria; it should also clearly define the variables under study, and describe in detail the statistical methods employed (including appropriate references about statistical methods and software). Procedures, products, and equipment should be described in sufficient detail so as to allow reproduction of the study. A statement concerning approval by the research ethics committee (or equivalent) of the institution in which the work was carried out must be included.

#### *Results*

Study results should be presented in a clear, objective manner, following a logical sequence. Information contained in tables or figures should not be repeated in the text. Use figures rather than tables to present extensive data.

#### *Discussion*

Results should be interpreted and compared with previously published data, emphasizing new and important aspects of the present study. Discuss the implications of the findings and the limitations of the study, as well as the need for additional research. Conclusions should be presented at the end of the Discussion section, taking into consideration the purpose of the work. Relate the conclusions to the initial study objectives, avoiding statements that are not supported by the findings and giving similar emphasis to positive and negative findings that have similar scientific relevance. If relevant, include recommendations for further research.

#### **Essential title page information**

The title page should contain all the following information:

- a) concise and informative title. Avoid unnecessary terms and abbreviations; also avoid reference to the site and/or city where the work was carried out;
- b) short title of not more than 50 characters including spaces to appear on the headers;
- c) authors' names (first and last names and middle initials) and ORCID ID. The **ORCID ID** must be inserted in all authors' profile. To do that go to Update your details, ORCID field; if any of the authors does not have an ORCID ID, it can be registered at <https://orcid.org/register>;
- d) authors' highest academic degree;
- e) e-mail address of all authors;
- f) if available, URL to electronic curriculum vitae ("Currículo Lattes" for Brazilian authors);
- g) the specific contribution of each author to the study;
- h) statement of conflicts of interest (write "nothing to declare" or clearly disclose any financial or other interests which could cause embarrassment if revealed after the publication of the article);

- i) institution or service with which the work is associated for indexing in Index Medicus/MEDLINE;
- j) name, address, telephone number, fax number, and e-mail of corresponding author;
- k) name, address, telephone number, fax number, and e-mail of author in charge of pre-publication contacts;
- l) funding sources, or name of institutions or companies providing equipment and materials, if applicable;
- m) word count of the main text not including abstract, acknowledgements, references, tables and legends to figures;
- n) abstract word count;
- o) number of tables and figures.

### **Abstract**

A concise and factual abstract is required. The abstract should state briefly the purpose of the research, the principal results and major conclusions. An abstract is often presented separately from the article, so it must be able to stand alone. For this reason, References should be avoided, but if essential, then cite the author(s) and year(s). Also, non-standard or uncommon abbreviations should be avoided, but if essential they must be defined at their first mention in the abstract itself.

The abstract should have no more than 250 words or 1,400 characters. Do not include words that could identify the institution or city where the study was performed, to facilitate blind review. All information in the abstract must accurately reflect the content of the article. The abstract should be structured as described below:

#### **Abstract for original articles**

**Objective:** State why the study was initiated and any initial hypotheses. Precisely define the main purpose of the study; only the most relevant secondary objectives should be listed.

**Method:** Describe the study design (if appropriate, state whether the study is randomized, blinded, prospective, etc.), setting (if appropriate, describe the level of care, i.e., primary, secondary or tertiary, private clinic or public institution, etc.), patients or participants (selection criteria, number of cases at the beginning and at the end of the study, etc.), interventions (include essential information, such as methods and duration of the study), and criteria used to measure the outcomes.

**Results:** Describe the most important findings, confidence intervals, and statistical significance of the findings.

**Conclusions:** Only describe conclusions that reflect the purpose of the study and that are supported by your findings. Discuss possible applications of the findings, with equal emphasis on positive and negative findings that have similar scientific merit.

#### **Abstract for review articles**

**Objective:** Explain why the review was performed, stating whether it focuses on a special factor, such as disease etiology, prevention, diagnosis, treatment or prognosis.

**Sources:** Describe all sources of information, defining databases and years researched. Briefly state the criteria used to select articles for review and to assess the quality of information.

**Summary of the findings:** State the main quantitative or qualitative findings.

**Conclusions:** State your conclusions and their clinical application, keeping generalizations within the scope of the subject under review.

### Keywords

Immediately after the abstract, provide a maximum of 6 keywords, using American spelling and avoiding general and plural terms and multiple concepts (avoid, for example, 'and', 'of'). Be sparing with abbreviations: only abbreviations firmly established in the field may be eligible. These keywords will be used for indexing purposes.

Please use Medical Subject Headings (MeSH), available at <http://www.nlm.nih.gov/mesh/meshhome.html>. Whenever adequate descriptors are not available you may use new terms.

### Abbreviations

Use abbreviations sparingly. All abbreviations must be spelled out at their first mention in the text. Abbreviations that are not standard in the field of pediatrics must be defined in a footnote to be placed on the first page of the article. Avoid the use of abbreviations in the abstract; those that are unavoidable in the abstract must be defined at their first mention there, as well as in the footnote. Ensure consistency of abbreviations throughout the article.

### Acknowledgements

Collate acknowledgements in a separate section at the end of the article before the references and do not, therefore, include them on the title page, as a footnote to the title or otherwise. List here those individuals who provided help during the research (e.g., providing language help, writing assistance or proof reading the article, etc.).

Only individuals or institutions that contributed significantly to the study, but are not qualified for authorship, should be mentioned. Individuals cited in this section must agree in writing to the inclusion of their names, since readers may infer their endorsement of the conclusions of the study.

### Formatting of funding sources

List funding sources in this standard way to facilitate compliance to funder's requirements:

Funding: This work was supported by the National Institutes of Health [grant numbers xxxx, yyyy]; the Bill & Melinda Gates Foundation, Seattle, WA [grant number zzzz]; and the United States Institutes of Peace [grant number aaaa].

It is not necessary to include detailed descriptions on the program or type of grants and awards. When funding is from a block grant or other resources available to a university, college, or other research institution, submit the name of the institute or organization that provided the funding.

If no funding has been provided for the research, please include the following sentence:

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

### Units

Follow internationally accepted rules and conventions: use the international system of units (SI). If other units are mentioned, please give their equivalent in SI.

### Math formulae

Please submit math equations as editable text and not as images. Present simple formulae in line with normal text where possible and use the solidus (/) instead of a horizontal line for small fractional terms, e.g., X/Y. In principle, variables are to be presented in italics. Powers of e are often more conveniently denoted by exp. Number consecutively any equations that have to be displayed separately from the text (if referred to explicitly in the text).

### Footnotes

Footnotes should not be used. Rather, incorporate the pertaining information in the main text.

### Artwork

#### Image manipulation

Whilst it is accepted that authors sometimes need to manipulate images for clarity, manipulation for purposes of deception or fraud will be seen as scientific ethical abuse and will be dealt with accordingly. For graphical images, this journal is applying the following policy: no specific feature within an image may be enhanced, obscured, moved, removed, or introduced. Adjustments of brightness, contrast,

or color balance are acceptable if and as long as they do not obscure or eliminate any information present in the original. Nonlinear adjustments (e.g. changes to gamma settings) must be disclosed in the figure legend.

#### *Electronic artwork*

##### *General points*

- Make sure you use uniform lettering and sizing of your original artwork.
- Embed the used fonts if the application provides that option.
- Aim to use the following fonts in your illustrations: Arial, Courier, Times New Roman, Symbol, or use fonts that look similar.
- Number the illustrations according to their sequence in the text.
- Use a logical naming convention for your artwork files.
- Provide captions to illustrations separately.
- Size the illustrations close to the desired dimensions of the published version.
- Submit each illustration as a separate file.
- Ensure that color images are accessible to all, including those with impaired color vision.

A detailed [guide on electronic artwork](#) is available.

**You are urged to visit this site; some excerpts from the detailed information are given here.**

##### *Formats*

If your electronic artwork is created in a Microsoft Office application (Word, PowerPoint, Excel) then please supply 'as is' in the native document format.

Regardless of the application used other than Microsoft Office, when your electronic artwork is finalized, please 'Save as' or convert the images to one of the following formats (note the resolution requirements for line drawings, halftones, and line/halftone combinations given below):

EPS (or PDF): Vector drawings, embed all used fonts.

TIFF (or JPEG): Color or grayscale photographs (halftones), keep to a minimum of 300 dpi.

TIFF (or JPEG): Bitmapped (pure black & white pixels) line drawings, keep to a minimum of 1000 dpi.

TIFF (or JPEG): Combinations bitmapped line/half-tone (color or grayscale), keep to a minimum of 500 dpi.

##### **Please do not:**

- Supply files that are optimized for screen use (e.g., GIF, BMP, PICT, WPG); these typically have a low number of pixels and limited set of colors;
- Supply files that are too low in resolution;
- Submit graphics that are disproportionately large for the content.

##### *Color artwork*

Please make sure that artwork files are in an acceptable format (TIFF (or JPEG), EPS (or PDF), or MS Office files) and with the correct resolution. If, together with your accepted article, you submit usable color figures then Elsevier will ensure, at no additional charge, that these figures will appear in color (e.g., ScienceDirect and other sites).

##### *Illustration services*

[Elsevier's Author Services](#) offers Illustration Services to authors preparing to submit a manuscript but concerned about the quality of the images accompanying their article. Elsevier's expert illustrators can produce scientific, technical and medical-style images, as well as a full range of charts, tables and graphs. Image 'polishing' is also available, where our illustrators take your image(s) and improve them to a professional standard. Please visit the website to find out more.

##### *Figure captions*

Ensure that each illustration has a caption. Supply captions separately, not attached to the figure. A caption should comprise a brief title (**not** on the figure itself) and a description of the illustration. Keep text in the illustrations themselves to a minimum but explain all symbols and abbreviations used.

##### **Tables**

Please submit tables as editable text and not as images. Tables can be placed either next to the relevant text in the article, or on separate page(s) at the end. Number tables consecutively in accordance with their appearance in the text and place any table notes below the table body. Be sparing in the use of tables and ensure that the data presented in them do not duplicate results described elsewhere in the article. Please avoid using vertical rules and shading in table cells.

##### **References**

*Citation in text*

Please ensure that every reference cited in the text is also present in the reference list (and vice versa). Any references cited in the abstract must be given in full. Unpublished results and personal communications are not recommended in the reference list, but may be mentioned in the text. If these references are included in the reference list they should follow the standard reference style of the journal and should include a substitution of the publication date with either 'Unpublished results' or 'Personal communication'. Citation of a reference as 'in press' implies that the item has been accepted for publication.

*Reference links*

Increased discoverability of research and high quality peer review are ensured by online links to the sources cited. In order to allow us to create links to abstracting and indexing services, such as Scopus, CrossRef and PubMed, please ensure that data provided in the references are correct. Please note that incorrect surnames, journal/book titles, publication year and pagination may prevent link creation. When copying references, please be careful as they may already contain errors. Use of the DOI is highly encouraged.

A DOI is guaranteed never to change, so you can use it as a permanent link to any electronic article. An example of a citation using DOI for an article not yet in an issue is: VanDecar J.C., Russo R.M., James D.E., Ambeh W.B., Franke M. (2003). Aseismic continuation of the Lesser Antilles slab beneath northeastern Venezuela. *Journal of Geophysical Research*, <https://doi.org/10.1029/2001JB000884>. Please note the format of such citations should be in the same style as all other references in the paper.

*Web references*

As a minimum, the full URL should be given and the date when the reference was last accessed. Any further information, if known (DOI, author names, dates, reference to a source publication, etc.), should also be given. Web references can be listed separately (e.g., after the reference list) under a different heading if desired, or can be included in the reference list.

*Data references*

This journal encourages you to cite underlying or relevant datasets in your manuscript by citing them in your text and including a data reference in your Reference List. Data references should include the following elements: author name(s), dataset title, data repository, version (where available), year, and global persistent identifier. Add [dataset] immediately before the reference so we can properly identify it as a data reference. The [dataset] identifier will not appear in your published article.

Users of Mendeley Desktop can easily install the reference style for this journal by clicking the following link:

<http://open.mendeley.com/use-citation-style/jornal-de-pediatria>

When preparing your manuscript, you will then be able to select this style using the Mendeley plugins for Microsoft Word or LibreOffice.

*Reference style*

References should follow the Vancouver style, also known as the Uniform Requirements style, which is based largely on an American National Standards Institute style adapted by the U.S. National Library of Medicine (NLM) for its databases.

Authors should consult *Citing Medicine, The NLM Style Guide for Authors, Editors, and Publishers* ( ) for information on the recommended formats for a variety of reference types. Authors may also consult sample references ([http://www.nlm.nih.gov/bsd/uniform\\_requirements.html](http://www.nlm.nih.gov/bsd/uniform_requirements.html)), a list of examples extracted from or based on *Citing Medicine* for easy general use; these sample references are maintained by NLM.

References must be numbered consecutively in the order in brackets. Do not use automatic numbering, footnotes or end notes for references.

Unpublished articles that have been accepted for publication may be included as references if the name of the journal is included followed by "in press."

Unpublished observations and personal communications should not be cited as references; if this information is essential for the understanding of the article, it may be cited within the text, followed by the observations in parentheses "unpublished observation" or "personal communication."

For more detailed information, refer to the Uniform Requirements for Manuscripts Submitted to Biomedical Journals, available at

Below we present some examples of the model adopted by *Jornal de Pediatria*:

#### **Articles in journals**

1. Up to six authors:

Araújo LA, Silva LR, Mendes FA. Digestive tract neural control and gastrointestinal disorders in cerebral palsy. *J Pediatr (Rio J)*. 2012;88:455-64.

2. More than six authors:

Ribeiro MA, Silva MT, Ribeiro JD, Moreira MM, Almeida CC, Almeida-Junior AA, et al. Volumetric capnography as a tool to detect early peripheral lung obstruction in cystic fibrosis patients. *J Pediatr (Rio J)*. 2012;88:509-17.

3. Organization as author:

Mercier CE, Dunn MS, Ferrelli KR, Howard DB, Soll RF; Vermont Oxford Network ELBW Infant Follow-Up Study Group. Neurodevelopmental outcome of extremely low birth weight infants from the Vermont Oxford network: 1998-2003. *Neonatology*. 2010;97:329-38.

4. No author given:

Informed consent, parental permission, and assent in pediatric practice. Committee on Bioethics, American Academy of Pediatrics. *Pediatrics*. 1995;95:314-7.

5. Article published electronically ahead of the print version:

Carvalho CG, Ribeiro MR, Bonilha MM, Fernandes Jr M, Procianny RS, Silveira RC. Use of off-label and unlicensed drugs in the neonatal intensive care unit and its association with severity scores. *J Pediatr (Rio J)*. 2012 Oct 30. [Epub ahead of print]

#### **Books**

Blumer JL, Reed MD. Principles of neonatal pharmacology. In: Yaffe SJ, Aranda JV, eds. *Neonatal and Pediatric Pharmacology*. 3rd ed. Baltimore: Lippincott, Williams and Wilkins; 2005. p. 146-58.

#### **Academic studies**

Borkowski MM. Infant sleep and feeding: a telephone survey of Hispanic Americans [dissertation]. Mount Pleasant, MI: Central Michigan University; 2002.

**CD-ROM** Anderson SC, Poulsen KB. Anderson's electronic atlas of hematology [CD-ROM]. Philadelphia: Lippincott Williams and Wilkins; 2002.

#### **Homepage/website**

*Journal abbreviations source*

Journal names should be abbreviated according to the [List of Title Word Abbreviations](#).

#### **Video**

Elsevier accepts video material and animation sequences to support and enhance your scientific research. Authors who have video or animation files that they wish to submit with their article are strongly encouraged to include links to these within the body of the article. This can be done in the same way as a figure or table by referring to the video or animation content and noting in the body text where it should be placed. All submitted files should be properly labeled so that they directly relate to the video file's content. In order to ensure that your video or animation material is directly usable, please provide the file in one of our recommended file formats with a preferred maximum size of 150 MB per file, 1 GB in total. Video and animation files supplied will be published online in

the electronic version of your article in Elsevier Web products, including [ScienceDirect](#). Please supply 'stills' with your files: you can choose any frame from the video or animation or make a separate image. These will be used instead of standard icons and will personalize the link to your video data. For more detailed instructions please visit our [video instruction pages](#). Note: since video and animation cannot be embedded in the print version of the journal, please provide text for both the electronic and the print version for the portions of the article that refer to this content.

### **Supplementary material**

Supplementary material such as applications, images and sound clips, can be published with your article to enhance it. Submitted supplementary items are published exactly as they are received (Excel or PowerPoint files will appear as such online). Please submit your material together with the article and supply a concise, descriptive caption for each supplementary file. If you wish to make changes to supplementary material during any stage of the process, please make sure to provide an updated file. Do not annotate any corrections on a previous version. Please switch off the 'Track Changes' option in Microsoft Office files as these will appear in the published version.

### **Research data**

This journal encourages and enables you to share data that supports your research publication where appropriate, and enables you to interlink the data with your published articles. Research data refers to the results of observations or experimentation that validate research findings. To facilitate reproducibility and data reuse, this journal also encourages you to share your software, code, models, algorithms, protocols, methods and other useful materials related to the project.

Below are a number of ways in which you can associate data with your article or make a statement about the availability of your data when submitting your manuscript. If you are sharing data in one of these ways, you are encouraged to cite the data in your manuscript and reference list. Please refer to the "References" section for more information about data citation. For more information on depositing, sharing and using research data and other relevant research materials, visit the [research data](#) page.

#### *Data linking*

If you have made your research data available in a data repository, you can link your article directly to the dataset. Elsevier collaborates with a number of repositories to link articles on ScienceDirect with relevant repositories, giving readers access to underlying data that gives them a better understanding of the research described.

There are different ways to link your datasets to your article. When available, you can directly link your dataset to your article by providing the relevant information in the submission system. For more information, visit the [database linking page](#).

For [supported data repositories](#) a repository banner will automatically appear next to your published article on ScienceDirect.

In addition, you can link to relevant data or entities through identifiers within the text of your manuscript, using the following format: Database: xxxx (e.g., TAIR: AT1G01020; CCDC: 734053; PDB: 1XFN).

#### *Mendeley Data*

This journal supports Mendeley Data, enabling you to deposit any research data (including raw and processed data, video, code, software, algorithms, protocols, and methods) associated with your manuscript in a free-to-use, open access repository. During the submission process, after uploading your manuscript, you will have the opportunity to upload your relevant datasets directly to *Mendeley Data*. The datasets will be listed and directly accessible to readers next to your published article online.

For more information, visit the [Mendeley Data for journals page](#).

#### *Data statement*

To foster transparency, we encourage you to state the availability of your data in your submission. This may be a requirement of your funding body or institution. If your data is unavailable to access or unsuitable to post, you will have the opportunity to indicate why during the submission process, for example by stating that the research data is confidential. The statement will appear with your published article on ScienceDirect. For more information, visit the [Data Statement page](#).

## **AFTER ACCEPTANCE**

#### *Availability of accepted article*

This journal makes articles available online as soon as possible after acceptance. This concerns the Journal Pre-proofs (both in HTML and PDF format), which have undergone enhancements after acceptance, such as the addition of a cover page and metadata, and formatting for readability, but are not yet the definitive versions of record. A Digital Object Identifier (DOI) is allocated, thereby making it fully citable and searchable by title, author name(s) and the full text. The article's PDF also carries a disclaimer stating that it is an unedited article. Subsequent production stages will simply replace this version.

#### **Proofs**

One set of page proofs (as PDF files) will be sent by e-mail to the corresponding author or, a link will be provided in the e-mail so that authors can download the files themselves. Elsevier now provides authors with PDF proofs which can be annotated; for this you will need to [download the free Adobe Reader](#), version 9 (or higher). Instructions on how to annotate PDF files will accompany the proofs (also given online). The exact system requirements are given at the [Adobe site](#).

If you do not wish to use the PDF annotations function, you may list the corrections (including replies to the Query Form) and return them to Elsevier in an e-mail. Please list your corrections quoting line number. If, for any reason, this is not possible, then mark the corrections and any other comments (including replies to the Query Form) on a printout of your proof and scan the pages and return via e-mail. Please use this proof only for checking the typesetting, editing, completeness and correctness of the text, tables and figures. Significant changes to the article as accepted for publication will only be considered at this stage with permission from the Editor. We will do everything possible to get your article published quickly and accurately. It is important to ensure that all corrections are sent back to us in one communication: please check carefully before replying, as inclusion of any subsequent corrections cannot be guaranteed. Proofreading is solely your responsibility.

#### **AUTHOR INQUIRIES**

Visit the [Elsevier Support Center](#) to find the answers you need. Here you will find everything from Frequently Asked Questions to ways to get in touch.

You can also [check the status of your submitted article](#) or find out [when your accepted article will be published](#).
