FOREWORD

The following is a list of generic, specific, and subspecific names of Trematoda listed in the Index-Catalogue of Medical and Veterinary Zoology. Subjects: Trematoda, Genera and Supergenera A-Z. It is also a supplement to the preceding catalogue in that genera and species described since 1960, the closing date of the series, as well as many not available at time of compilation have been included. It serves as a link to bind together the information contained in the other catalogues of the Trematoda series, i.e., the Parasite, or master catalogue, the Host Catalogue, and the Geographical Catalogue. This list must be used with the Author Catalogue of the Index-Catalogue of Medical and Veterinary Zoology as the bibliographical key. If a given genus or species has not been listed in the Author Catalogue, bibliographical information as well as host, location, and locality have been added to this Checklist. Such information is also being entered in the Host and Geographical Catalogues and is marked with an asterisk *.

Basic information on the genera includes the author of the genus, the year published, the pages of the description, and the type if given by the author. Example:

TAGIA Sproston, N. G., 1946a, 190, 419-420 (tod: *T. ecuadori*).

For species and subspecies, the basic information regarding author, date of publication, pagination, and illustrations, is given and also the genus or genera in which the species or subspecies has been placed and the years in which such combinations were made. Example:

excavata Rudolphi, C. A., 1803a, 28-29. 1803: FASCIOLA. 1809: DISTOMA. 1819: HOLOSTOMA. 1819: AMPHISTOMA. 1850: HEMISTOMUM. 1936: PROALARIA. 1929: DIPLOSTOMUM. 1933: PRODIPLOSTOMUM (tod). 1935: TYLODELPHYS.

Thus anyone seeking complete information concerning this species must check the Parasite Catalogue under nine combinations with this name.

Collective group names for immature forms such as Adolescaria, Cercaria, and Metacercaria are treated for convenience as if they were genera. Brackets [] around date, word, or group of words mean that the enclosed information was supplied by the compiler. Parentheses () around a date indicate that the original description has not been seen.

This checklist is designed to contribute to the stabilization of nomenclature in a small segment of the immense field of zoology. Authors using it can quickly ascertain whether a selected generic name has been used previously or whether a specific name has ever been combined with a given generic name, and thus avoid creating a homonym.

This investigation was supported in whole by Public Health Service Research Grant, E4334, from the U.S. National Institute of Allergy and Infectious Diseases to the University of Maryland.

FOREWORD

The following is a list of genera, species, and subspecific names of
Trematodes found in the genus *Alveolus* and *Alveolus*
Zoology, Budapest; Trematode Genera and Subgenera A-Z. It is
also a supplement to the preceding catalogue in that genera and species
described since 1960, the closing date of the work, as well as being an
update in terms of compilation and classification. It serves as a
handy pocket reference for the information contained in the other catalogues of
the Trematode series, i.e. the Trematode or water catalogues, the Fish
Catalogue, and the Geographical Catalogue. The list must be used
with the Author's Catalogue of the Index Catalogue of Medical and
Veterinary Zoology as the index-catalogue key. It is given genus or
species has not been listed in the Author's Catalogue. Additional material
information as well as host, location, and locality have been added to
this Checklist. Such information is also being entered in the host and
Geographical Catalogues and is marked with an asterisk (*).
Basic information on the genera includes the author of the genus,
the year published, the pages of the description, and the type it gives
by the author. I sample:

TAXIA Spixen, N. G. 1842, 100, 419-420 (host: Y. covadour).
For species and subspecies, the basic information regarding author,
date of publication, pagination, and illustration, is given and also
the genus or genera in which the species or subspecies has been placed
and the years in which such combinations were made. Examples:

- DISTOMA 1819: HOLOSOMA 1819: AMPHISTOMA
1820: HEMISTOMA 1820: PROALARIA 1820: DITLO
STOMUM 1820: PLODIPLO 1820: 1820-1820
DELPHYS

That anyone seeking complete information regarding this species
must check the Parasite Catalogue under nine combinations with the
name.

Collective group names for immature forms such as Adolescents,
Larvae, and Metacercariae are treated for convenience as if they were
generic (includes) around date, word, or group of words used
that the enclosed information was supplied by the compiler. Paren-
theses () around a date indicate that the original description has
not been seen.

Terms that are deemed to contribute to the identification of human-
nature in a short sentence of the form: "Host of *Alveolus* *Alveolus*
using it can quickly ascertain whether a selected generic name has
been used previously or whether a specific name has been con-
fused with a given generic name, and thus avoid creating a homonym.

This investigation was supported in whole by Public Health Service Research
Grant E-1111 from the U.S. National Institute of Health and includes the
work of the University of Maryland.
