14 de septiembre de 1994**

RED GEODÉSICA FUNDAMENTAL PARA EL CATASTRO DE LA MUNICIPALIDAD RÍO GRANDE (Provincia de Tierra del Fuego)

1. Localización del levantamiento

La red consta de quince puntos fundamentales distribuidos en el éjido urbano de la ciudad de Río Grande, provincia de Tierra del Fuego, según se muestra en la tabla y figura 1. Los sitios donde se emplazaron dichos puntos fueron elegidos de común acuerdo con las autoridades del catastro y en la tabla 1 se da su ubicación aproximada. Las monografías de acceso detalladas son responsabilidad del Catastro Municipal.

Denominación del punto	Ubicación
PF00	Estación Astronómica Río Grande
PF01	Escuela N° 20
PF02	Prefectura Naval y Santa Rosa
PA02	Santa Rosa
PF03	Parque Industrial
PF04	San Martín y Ruta Nacional N° 3
PF05	Rotonda Ofen
PF06	Barrio Profesionales
PF07	Belgrano y Alma Fuerte
PF08	Belgrano y Elcano
PA08	Elcano
PF09	Predio antena Radio Nacional
PF10	Plaza Delfín
PF11	Baliza CAP
PF12	Barrio Austral

Tabla 1: ubicación aproximada de los puntos.

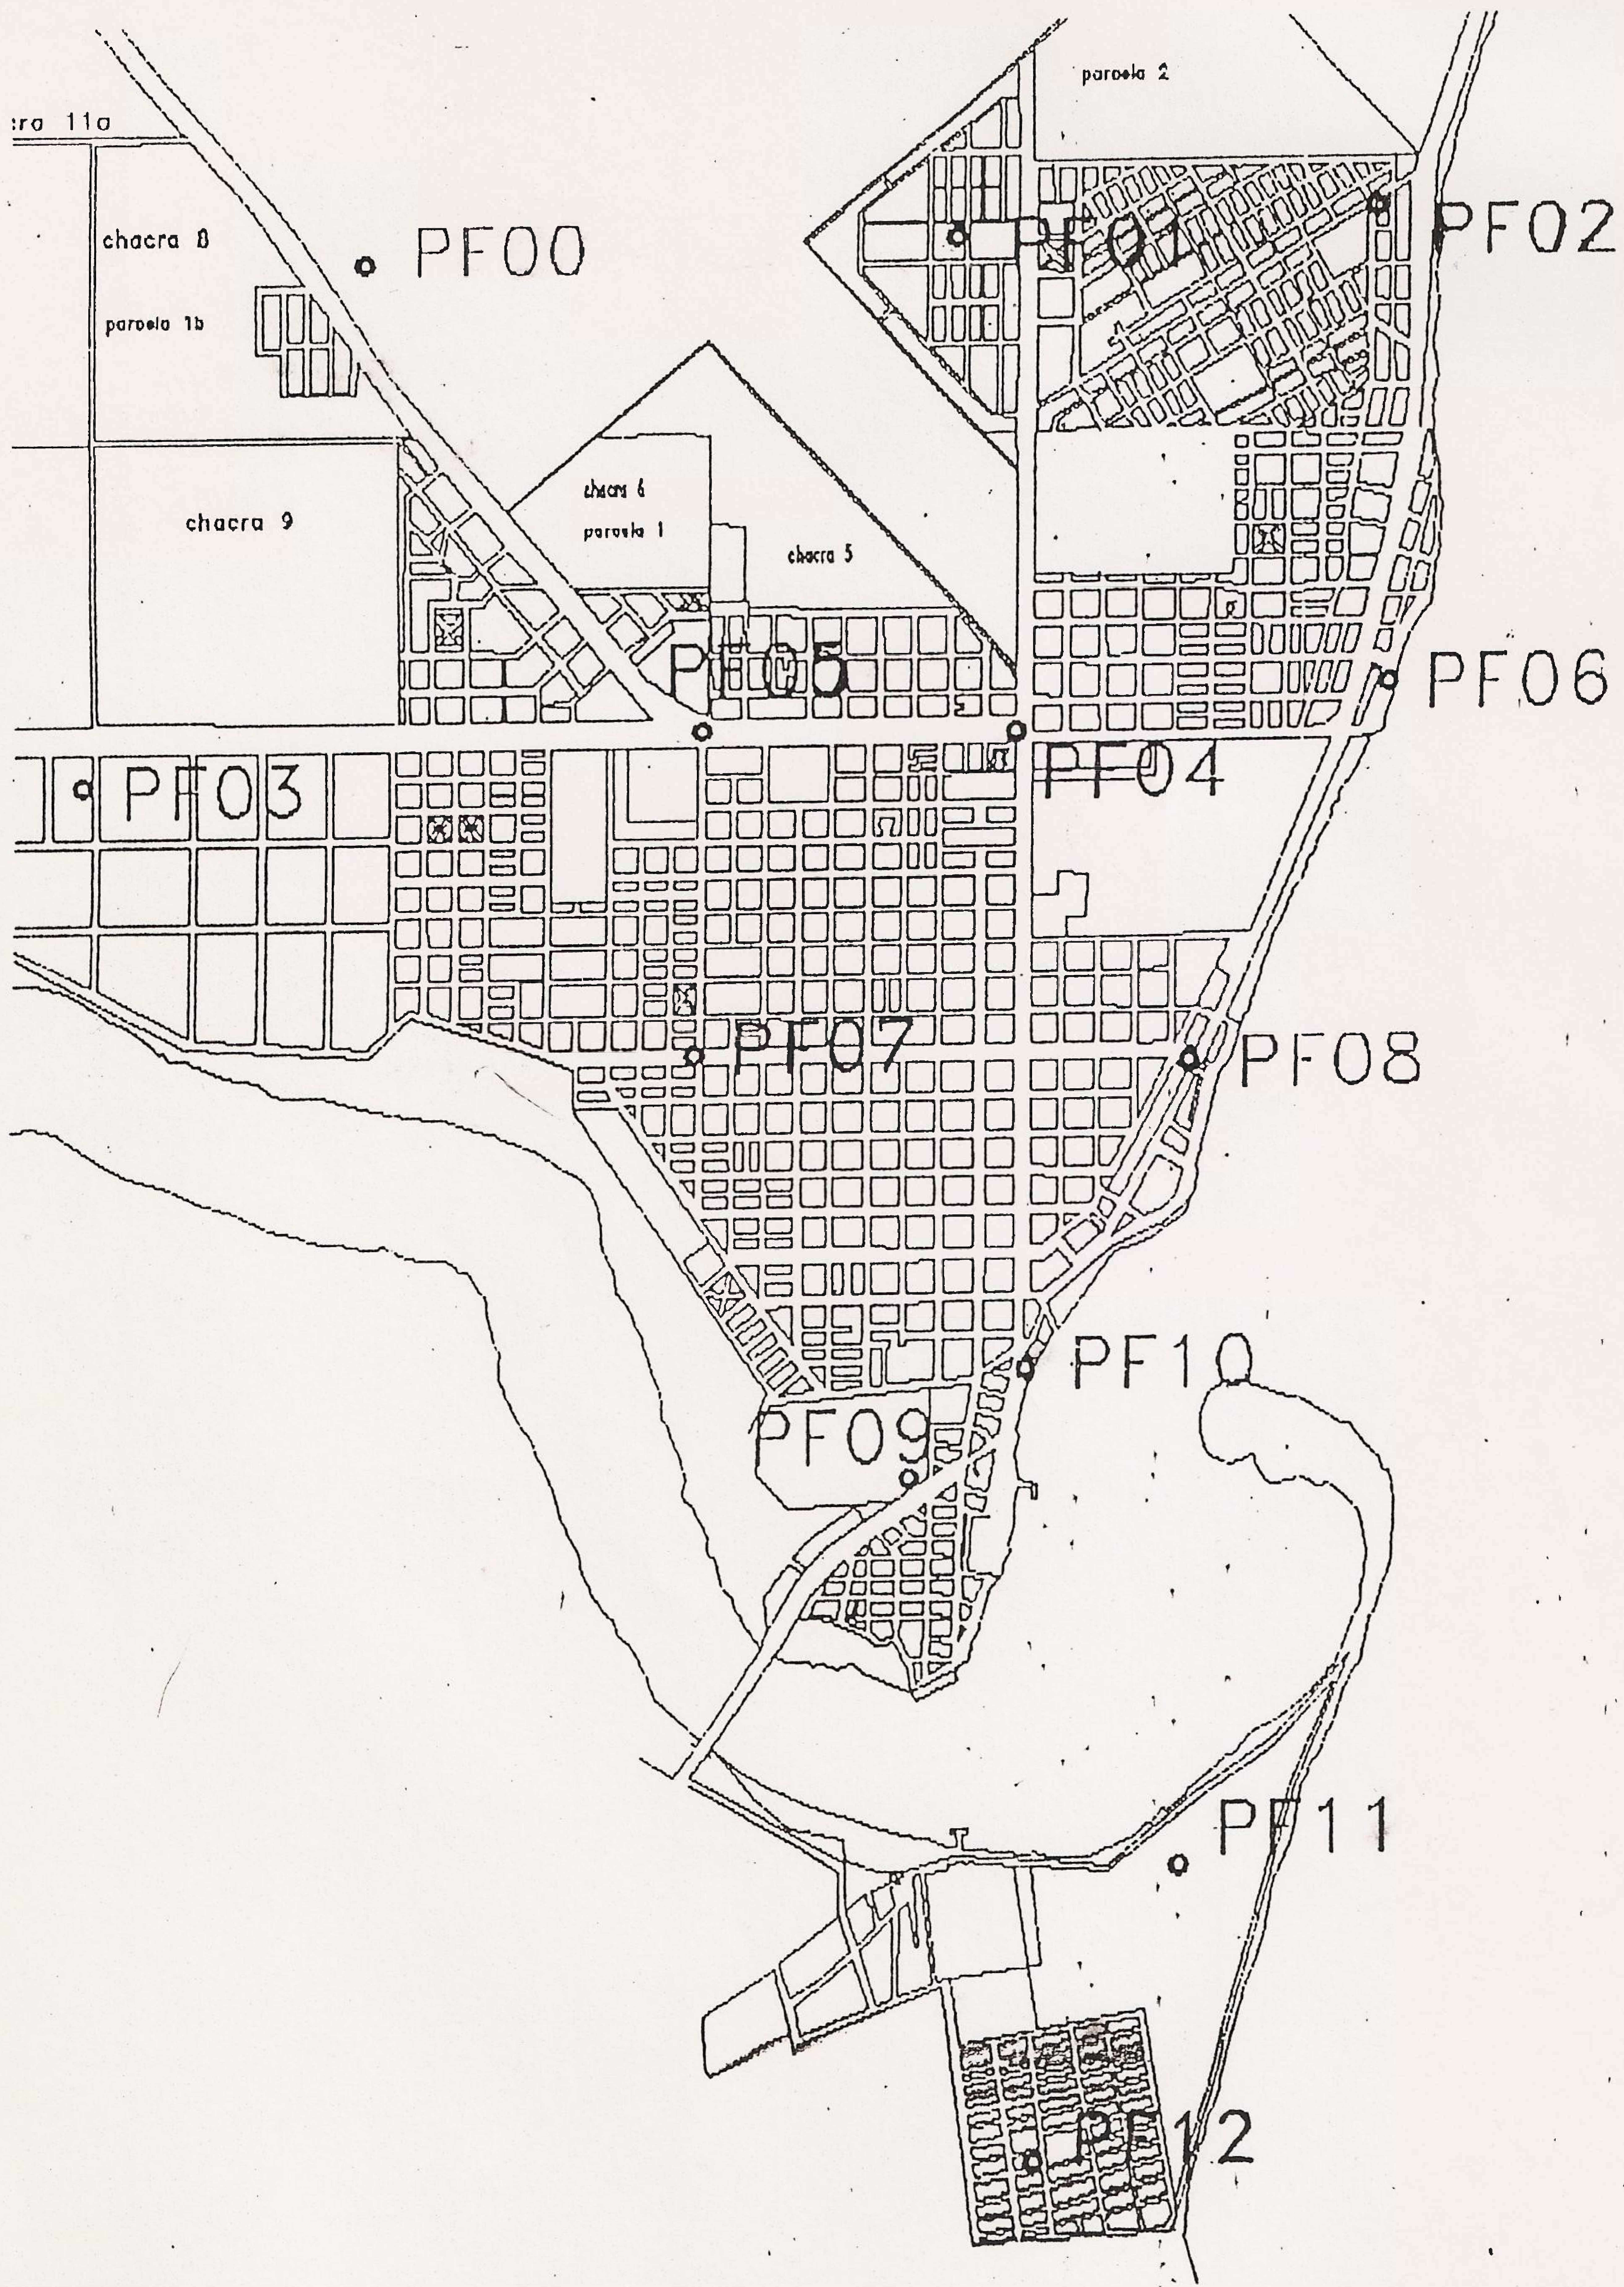

Figura 1: Ubicación aproximada de los puntos.

2. Objetivo del levantamiento

El objetivo de esta red es servir de apoyo geodésico para los levantamientos catastrales urbanos, brindando un marco de referencia preciso, apto para trabajar con la moderna tecnología GPS (pero que también permita el trabajo con técnicas clásicas) y adecuado como referencia geométrica para un futuro sistema de información territorial o geográfica.

Para satisfacer este objetivo se establecieron los siguientes criterios:

- * el error de punto no superará la cota de un centímetro para ningún punto de la red, lo que garantiza una precisión compatible con los requerimientos catastrales más exigentes;

- * como resultado final se darán coordenadas geodésicas φ , λ , h , en el Sistema Geodésico Mundial de 1984 (WGS84), lo que asegura una referencia geométrica compatible con el resto de la provincia y también con el resto del territorio nacional;

- * se calcularán para todos los puntos alturas del geoide, N , con uno de los mejores modelos de geoide disponibles, lo que permitirá tener alturas ortométricas H , dentro de la precisión del modelo;

- * se calcularán coordenadas superficiales en la proyección Gauss Krüger, a los efectos de la edición cartográfica;

- * para el emplazamiento de todos los puntos se elegirán sitios de muy fácil acceso y con horizonte despejado, para permitir la recepción de señales GPS, y para posibilitar el trabajo con técnicas clásicas de levantamiento se asegurará un número mínimo de puntos intervisibles de a pares.

3. Descripción de la monumentación utilizada

La monumentación de todos los puntos (excepto PF00 y PF06) fue realizada por personal de Obras Públicas de la Municipalidad de Río Grande y consistió en pilares de hormigón armado de sección cuadrada de 20 cm de lado y 1 m de alto, enterrados en el terreno natural, asomando aproximadamente 10 cm por sobre el nivel de piso firme. Como marca se usó un tornillo de bronce empotrado en la parte superior del pilar, con rosca estándar de teodolito para permitir la centración forzosa, y con un orificio central de 2 mm de diámetro para permitir la centración con plomada óptica o física.

Para el punto PF06 se aprovechó un monumento existente de similares características, excepto que la marca sólo permite centración con plomada.

El punto PF00 es el origen de la red. Este punto se encuentra en el predio de la Estación Astronómica Río Grande, ubicado sobre la ruta de acceso al aeropuerto de la ciudad, quinientos metros antes de arribar al mismo. Su monumentación es de alta estabilidad y consiste en un pilar de un metro cúbico de hormigón armado, enterrado en terreno natural, con una marca de acero en su parte superior que solo permite centración forzosa. Puesto que la rosca de la misma no es estándar, se colocó un adaptador roscado (ver párrafo subrayado en el ítem 4).

4. Descripción del instrumental utilizado

Para la medición se utilizaron tres receptores geodésicos marca Trimble Navigation, modelo 4000 SSE, con antenas geodésicas externas tipo 4000 ST L1/L2. Este tipo de equipo permite acceder a todos los observables del sistema GPS: fases de L1, fase de L2, código de adquisición rápida (CA) y código preciso (P), este último en forma directa o por la técnica de correlación cruzada en caso de estar activado el encriptamiento del código P (anti spoofing). En la tabla siguiente se dan datos adicionales sobre el instrumental utilizado.

Denominación del equipo	Número de serie del receptor	Número de serie de la antena	Versión del software del receptor
28	3249 A 02046	066414	NAV: 5.53 SIG: 1.20 BOOT: 3.30
26	3249 A 02044	066305	NAV: 5.53 SIG: 1.20 BOOT: 3.30
11	3248 A 01982	066330	NAV: 5.64 SIG: 1.23 BOOT: 3.30

Tabla 2: Números de serie de receptores y antenas y versiones de los softwares de los receptores.

Las observaciones se realizaron con la siguiente configuración:

frecuencia de muestreo: 15 segundos
máscara de elevación 10 grados
cantidad mínima de satélites 1

En todos los puntos de la red excepto en PF06 se utilizó centración forzosa "a tope" (es decir, no se orientaron las antenas). En PF00 la centración forzosa se realizó usando un adaptador roscado "a tope" sobre la marca empotrada en el pilar y la altura de la antena se redujo al adaptador (no a la marca empotrada). La altura del adaptador utilizado es de 40 mm.

En PF06 la antena se montó sobre un trípode horizontalizado, fue centrada mediante plomada física y orientada hacia el norte geográfico y la altura se midió en forma inclinada.

5. Desarrollo del levantamiento

Sobre la base de un diseño previamente estudiado, el día 2 de diciembre de 1994 se realizó el reconocimiento y la elección de sitios; el día 4 se realizó la monumentación y entre los días 5 y 6 (días GPS 338 y 339) se llevaron a cabo las medidas, según el esquema que se muestra en la tabla 3.

Las figuras 2 y 3 muestran un diagrama de los vectores medidos durante los días 338 y 339 y la figura 4 muestra la totalidad de los vectores medidos. La figura 5 muestra la geometría orbital (sky plot) entre las 10 hs y las 18 hs (hora local) para el punto PF00, la 6, los satélites accesibles, y la 7, la cantidad de satélites simultáneos y el factor puntual de dilución de la precisión (PDOP).

Día/Sesión	Receptor 11 sitio / alt ant	Receptor 26 sitio / alt ant	receptor 28 sitio / alt ant	Hora comienzo / final
338 / 1	PF00 / 0.050**	PF01 / 0.056	PF02 / 0.056	10:00 / 11:00
/ 2	PF00 / 0.050**	PF03 / 0.056	PF05 / 0.056	11:30 / 12:30
/ 3	PF00 / 0.050**	PF04 / 0.056	PF06 / 0.686*	13:00 / 14:00

6. Comentarios adicionales

A continuación se enuncian los principales inconvenientes encontrados y la forma en que fueron resueltos:

* En la mayoría de los sitios se observó tráfico de vehículos cercano a la antena mientras se estaban desarrollando las observaciones, pese a lo cual no se encontraron problemas en el cálculo que evidencien multi path.

* Por problemas en el set up del receptor 28 en la sesión 1 del día 339 (PF12) sólo se registraron 12 minutos de observaciones, pese a lo cual el vector se pudo resolver satisfactoriamente y no se consideró necesario remedir la sesión.
