This thesis presents the research works that has been carried out in the development and characterizations of light sources based on two gain medium, namely Erbium and Brillouin. The laser gain medium used in the research work is in the form of optical fiber rather than bulk piece of doped crystal or glass. The physical structure of the gain medium makes it easy to be spliced with other optical components in the Fiber laser configurations. The Brillouin gain comes from a standard single mode fiber used in the optical fiber communication system. The aim of the research work is to investigate various techniques in Fiber laser that allow the generation of multiple laser output (or multi-wavelength) from a single light source unit. The techniques differ from each other in the wavelength selection mechanism and the gain medium used in the configurations.

In the first experiment, optical fiber Bragg grating has been chosen as the wavelength selective technique. Through this configuration, a dual and switchable laser output can be constructed. The output of the laser can be made to switch between single wavelength or with both wavelengths lasers simultaneously. A moderate laser output power (about 10 mW at 60 mW EDF pump power) has also been achieved with both output power has a uniform power level. The multi-wavelength output can be easily increased through the addition of more optical fiber Bragg grating.

Through a linear fiber laser configuration which incorporates Fabry-Perot band-pass filter, a dual laser output system has been demonstrated. A novel technique has been suggested which allows for a uniform output power levels at any wavelengths within the EDF allowable gain profile. This was achieved by varying the optical attenuator values placed at one of the laser cavity loops such that it changes the cavity loss at that particular wavelength of interest.

Finally, by combining two gain medium within a laser cavity, a fiber laser system that is capable of achieving high number of laser outputs is being constructed. The mechanism that is responsible for the generation of the multiple laser output is the Stimulated Brillouin scattering phenomena and the feedback loop that is incorporated within the laser cavity. Output of more than 20 laser lines could be achieved with such configuration. Besides producing a high number of laser lines, the output can also be made tuneable within a wide range. A tuning range of up to 34 nm has been demonstrated for a ring laser configuration and 17 nm for linear laser configuration. The work presented in this thesis also reported for the first time a tuneable L-band Brillouin/Erbium fiber laser system adopting a linear laser cavity. A tuning range of up to 11 nm can be achieved with average laser output of 10 signals.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**PEMBANGUNAN DAN PENCIRIAN  
PUNCA CAHAYA LASER GENTIAN OPTIK PELBAGAI KELUARAN  
BERDASARKAN PENGGANDA ERBIUM DAN BRILLOUIN**

Tesis ini membentangkan aktiviti penyelidikan dan pencirian yang telah dilaksanakan terhadap punca cahaya berdasarkan dua jenis perantara pengganda iaitu Erbium dan Brillouin. Perantara pengganda laser yang digunakan didalam ujikaji ini adalah di dalam bentuk gentian optik sebagai ganti kepada bongkah optik terdopan jenis kristal atau kaca. Pengganda Erbium yang digunakan adalah di dalam bentuk gentian optik yang memudahkan ia disambung kepada komponen optik yang lain. Pengganda Brillouin pula diperolehi dalam bentuk gentian optik yang biasa digunakan di dalam sistem komunikasi gentian optik. Matlamat penyelidikan ini adalah untuk menyelidiki pelbagai teknik di dalam laser gentian yang boleh menghasilkan keluaran pelbagai laser dari satu punca cahaya. Teknik yang digunakan berbeza di antara satu sama lain dari segi cara pemilihan jarak gelombang dan jenis pengganda laser yang digunakan di dalam konfigurasi laser gentian yang diselidiki.

Ujikaji pertama menggunakan gentian optik parutan Bragg sebagai teknik untuk pemilihan jarak gelombang operasi laser. Melalui konfigurasi ini, dua keluaran laser yang boleh disusis telah diperolehi. Laser jenis ini boleh disusiskan untuk menghasilkan isyarat laser tunggal atau sekaligus kedua isyarat keluaran. Kuasa keluaran laser yang sederhana (sekitar 10 mW pada kuasa mengepam EDF 60 mW) telah dicapai dengan kedua-dua isyarat laser mempunyai tahap keluaran kuasa yang hampir sama. Keluaran laser boleh ditingkatkan dengan cara menambah bilangan dan menyambung gentian optik parutan Bragg ke sistem laser yang sedang di kaji.

Tiga kaedah pemilihan jarak gelombang telah digunakan di dalam ujikaji iaitu gentian optik parutan Bragg, penapis lulus jalur dan jarak gelombang yang diperolehi dari anjakan frekuensi isyarat Stoke yang dipam oleh punca laser yang lain. Oleh itu, tesis ini mengandungi beberapa ujikaji yang menunjukkan keupayaan setiap teknik di dalam penghasilan punca cahaya laser pelbagai keluaran. Selain daripada

keupayaan keluaran pelbagai, penyelidikan terhadap keupayaan talaan setiap teknik turut dilaksanakan.

Turut diketengahkan di dalam tesis ini ialah satu teknik yang mampu menghasilkan laser pelbagai keluaran yang boleh ditala ialah melalui teknik gentian laser linear yang mengandungi penapis lulus jalur jenis Fabry-Perot. Satu teknik untuk menghasilkan keluaran kuasa laser yang setara untuk kedua isyarat laser pada sebarang jarak gelombang di dalam profil gandaan EDF yang dibenarkan telah berjaya dikemukakan. Ia dihasilkan dengan cara mengubah nilai alat perosot yang diletakkan di dalam salah satu rongga gelung laser supaya kehilangan di dalam rongga laser dapat diubah untuk jarak gelombang yang diingini.

Dengan menggandingkan dua pengganda laser di dalam satu rongga laser, satu sistem yang mampu mencapai keluaran laser pelbagai yang tinggi dapat dihasilkan. Mekanisma yang bertanggungjawab ke atas penjanaan bilangan keluaran laser yang tinggi ini adalah fenomena yang di kenali sebagai penyerakan Brillouin terangsang dan gelung suap balik di dalam sistem rongga laser. Keupayaan sistem ini boleh mencapai sehingga 20 keluaran laser pelbagai. Selain dari keluaran laser pelbagai yang tinggi, keluaran sistem ini mampu ditala untuk julat yang lebar. Jarak talaan sehingga 34 nm telah diperolehi untuk konfigurasi gegelang dan 17 nm untuk konfigurasi linear.

Penyelidikan terhadap sistem laser pelbagai keluaran pada jalur L turut dikaji melalui laser gentian linear yang menggandingkan pengganda Erbium dan Brillouin. Jarak talaan sehingga 11 nm telah dicapai dengan keluaran laser sebanyak 10 isyarat.

This thesis submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirements for the degree of Doctor of Philosophy. The members of the Supervisory Committee are as follows.

## CHAPTER

### **1 INTRODUCTION**

- 1.1 Background
- 1.2 Motivation of research
- 1.3 Objectives of Research
- 1.4 Contribution of Research
- 1.5 Study model
- 1.6 Thesis outline

### **2 LITERATURE REVIEW AND THEORY**

- 2.1 Introduction
- 2.2 Continuous wave (CW) Fiber laser chronology
- 2.3 Review of Laser principles
- 2.4 Population inversion
- 2.5 Gain and losses in laser
- 2.6 Choice of laser medium
- 2.7 Fiber Laser Principles
- 2.8 Lasing Wavelength of an Erbium Doped Ring Fiber Laser
- 2.9 Output Power of Ring EDL
- 2.10 Stimulated Brillouin Scattering (SBS)
- 2.11 Multi-Wavelength Laser Generation
- 2.12 Multi-Wavelength Brillouin Erbium Fiber Laser
- 2.13 Characterization of Light Sources
  - 2.13.1 Laser Optical Power
  - 2.13.2 Laser Spectral Width
  - 2.13.3 Power Conversion Efficiency
  - 2.13.4 Lasing Threshold
  - 2.13.5 Laser wavelength
  - 2.13.6 Side Mode Suppression Ratio (SMSR)
  - 2.13.7 Laser tuneability
- 2.14 Conclusion

### **3 SWITCHABLE SINGLE/DUAL CHANNEL ERBIUM DOPED FIBER LASER**

- 3.1 Introduction
- 3.2 Experimental Set-Up
- 3.3 Results and Discussions
  - 3.3.1 EDL Laser Threshold
  - 3.3.2 Output Power and Spectral Width of an EDL System for Various Coupling Ratios
  - 3.3.3 EDL Output at Different EDF Pump Power
  - 3.3.4 Tuning Range
  - 3.3.5 Switching Properties of a Switchable Fiber Laser System
  - 3.3.6 Effect of EDF Pump Towards Single Output of The Switchable Laser System
  - 3.3.7 Effect of EDF Pump Power Towards Dual Laser Output of The Switchable Laser System
  - 3.3.8 Effect of Optical Coupling Ratio Towards Switchable Output Laser System
- 3.4 Conclusion

### **4 TUNEABLE DUAL WAVELENGTH EDL**

- 4.1 Introduction
- 4.2 Experimental Set-Up
- 4.3 Results and Discussions
  - 4.3.1 Effect of Reflectivity Towards EDL Output Power
  - 4.3.2 Effect of Various EDF Pumping Scheme Towards EDL Output Power
  - 4.3.3 Effect of EDF Pump towards SMSR
  - 4.3.4 Tuneability of Dual Output EDL System
  - 4.3.5 Effect of Variable Optical Attenuator (VOA) Towards Laser Outputs
- 4.4 Conclusion

### **5 SINGLE AND MULTI-WAVELENGTH BRILLOUIN/ERBIUM FIBER LASER BASED OF RING CONFIGURATION**

- 5.1 Introduction
- 5.2 Experimental Set-Up
- 5.3 Results and Discussions
  - 5.3.1 Brillouin Threshold and Evolution of Stokes
  - 5.3.2 Effect of EDF and Brillouin Pump Towards BEFL Output
  - 5.3.3 BEFL Side Mode Suppression Ratio (SMSR)
  - 5.3.4 Optimization of EDF Pump
  - 5.3.5 Effect of Brillouin Pump Towards BEFL Output
  - 5.3.6 Stoke Power Level against Monitoring BP Power
  - 5.3.7 Wavelength Tuning
  - 5.3.8 Brillouin Threshold and Signal in Multi-Wavelength BEFL

- 5.3.9 The Effect of Tuneable Band-Pass Filter (TBF) towards Multi-Wavelength BEFL Output
- 5.3.10 Flatness of Output Power Employing TBF
- 5.3.11 Tuneability of Multi-Wavelength BEFL System
- 5.3.12 Total Stoke Power
- 5.3.13 Effect of EDF2 Towards BEFL Output
- 5.3.14 Effect of BP Power Towards Number of Stoke's Order in Multi-Wavelength BEFL
- 5.4 Conclusion

## **6 C AND L BAND LINEAR CONFIGURATION OF MULTI-WAVELENGTH BRILLOUIN/ERBIUM FIBER LASER**

- 6.1 Introduction
- 6.2 Experimental Set-Up
- 6.3 Results and Discussions
  - 6.3.1 Effect of EDF Pump Power Towards BEFL System with SMF's Length of 1.97 Km.
  - 6.3.2 Effect of Varying BP Power at SMF Length of 1.97 km and BP Wavelength of 1548 nm
  - 6.3.3 Effect of EDF Pump Power Towards BEFL System With 8 km SMF
  - 6.3.4 Effect of Varying BP's Wavelengths Towards the Number of Stoke Lines
  - 6.3.5 Effect of EDF's Length towards BEFL Output Employing Bi-Directional Pumping Scheme
  - 6.3.6 Effect of EDF Pump and BP Power for BEFL System Employing Bi-Directional Pumping at BP Wavelength of 1597 nm
  - 6.3.7 Stoke Generation from a Shorter (1.97 km) SMF Length
- 6.4 Conclusion

## **7 CONCLUSION AND FUTURE WORKS**

- 7.1 Conclusion
- 7.2 Future Works
