DEDICATION

Thanks to my beloved wife, sons, parents and my loving family for their patience and support during the long preparations of this thesis

Abstract of thesis presented to the Senate of Universiti Putra Malaysia
In fulfilment of the requirements for the degree of Doctor of Philosophy

**DEVELOPMENT OF POLYURETHANE/CLAY NANOCOMPOSITES BASED
ON PALM OIL POLYOL**

By

Teuku Rihayat

November 2007

Chairman : **Assoc.Prof. Dr. Saari B. Mustapha**
Faculty : **Engineering**

Polyurethanes (PURs) are very versatile polymeric materials with a wide range of physical and chemical properties. PURs have desirable properties such as high abrasion resistance, tear strength, shock absorption, flexibility and elasticity. Although they have relatively poor thermal stability, this can be improved by using treated clay. Polyurethane/clay nanocomposites have been synthesized from renewable sources. A polyol for the production of polyurethane by reaction with an isocyanate was obtained by the synthesis of palm oil-based oleic acid with glycerol. Dodecylbenzene sulfonic acid (DBSA) was used as catalyst and emulsifier. The unmodified clay (kunipia-F) was treated with cetyltrimethyl ammonium bromide (CTAB-mont) and octadodecylamine (ODA-mont). The *d*-spacing in CTAB-mont and ODA-mont were 1.571 nm and 1.798 nm respectively and larger than that of the pure-mont (1.142 nm). The organoclay was completely intercalated in the polyurethane, as confirmed by a wide angle x-ray diffraction (WAXD) pattern.

Polyurethane/clay nanocomposites were prepared by a pre-polymer method and were evaluated by fourier transform infrared (FTIR) spectra to determine micro-domain structures of segmented PU, CTAB-mont-PU 1, 3, 5 wt% and ODA-mont-PU 1, 3, 5 wt%. The morphology of the nanocomposites was characterized by X-ray diffraction (XRD) and the pattern showed that all of the nanocomposites produced from this work are of the intercalated type. These were further confirmed by transmission electron microscopy (TEM) observation and scanning electron microscopy (SEM) when the surfaces of the materials were studied. Thermal stability was investigated with thermogravimetric analysis (TGA). The results showed that adding clay demonstrated better thermal stability in comparison with the virgin polyurethane. Onset degradation of pure PU is at 200°C, and is lower than that of the CTAB-mont PU and ODA-mont PU which takes place at about 318°C and 330°C, respectively. The mechanical properties (including the dynamic mechanical properties) of pure polyurethane (PU) and PU/clay nanocomposites, were measured. The modified organoclay had a remarkably beneficial effect on the strength and elongation at break of the nanocomposites, which both increased with increasing clay content with the increase of the tensile strength of more than 214% and 267% by the addition of only 5 wt% of the montmorillonite CTAB-mont PU and ODA-mont PU, respectively.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia
Sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**Pembangunan Poliuretana/tanah liat Bernano Komposit Berasaskan
Poliol Minyak Sawit**

Oleh

Teuku Rihayat

Nopember 2007

Pengerusi : Prof. Madya Dr. Saari B. Mustapha

Faculti : Kejuruteraan

Poliuretana (PUR) merupakan bahan polimer yang sangat versatil yang mempunyai ciri-ciri fizikal dan kimia yang sangat luas. PUR juga mempunyai sifat-sifat yang menarik seperti ketahanan lelasan, kekuatan koyak, penyerapan kejutan, fleksibiliti dan kekenjalan yang tinggi. Walaupun PUR mempunyai kestabilan terma yang rendah tetapi ia masih boleh diperbaiki dengan menggunakan tanah liat terawat. Polyurethane/tanah liat bernano komposit telah disintesa daripada bahan boleh diperbaharui. Bahan polioliol bagi penghasilan polyurethane melalui tindakbalas dengan isosianat telah diperolehi melalui sintesis asid oleic dari minyak sawit dengan gliserol. Asid dodecylbenzene sulfonic (DBSA) pula berfungsi sebagai pemangkin dan pengemulsi. Tanah liat asal (Kunipia-F) telah dirawat dengan cetyltrimethyl bromide ammonium (CTAB-mont) dan octadodecylamine (ODA-mont). Jarak d pada CTAB-mont dan ODA-mont adalah 1.571 nm dan 1.798 nm yaitu lebih besar daripada mont tulen (1.142 nm). Tanah liat telah tersisip ke dalam PU sebagai ditunjukkan pada corak WAXD.

PU/tanah liat bernano komposit telah disediakan daripada kaedah prapolimer dan dinilai melalui fourier transform infra red (FTIR) rajah bagi menentukan struktur mikro domain bersegmen PU, CTAB-mont PU 1, 3, 5 wt% dan ODA-mont-PU 1, 3, 5 wt%. Morfologi ke atas nanokomposit telah digambarkan sifatnya melalui belauan X-ray (X-RD) dan corak tersebut menunjukkan bahawa kesemua nanokomposit yang terhasil dalam kajian adalah dari jenis "*intercalated*". Kajian lebih lanjut dilakukan dengan menggunakan kaedah "transmission electron microscopy" (TEM) dan "scanning electron microscopy" (SEM) untuk mempelajari permukaan dari bahan material tersebut. Kestabilan terma bahan dikaji melalui analisis termogravimetri (TGA). Kajian menunjukkan penambahan tanah liat menghasilkan kestabilan terma yang lebih baik berbanding PU tulen. Sifat-sifat mekanikal (termasuk sifat-sifat mekanikal dinamik) bagi PU tulen dan PU/tanah liat bernano komposit telah diukur. Kajian mendapati tanah liat berorgano memberikan peningkatan yang memberangsangkan dalam sifat tegang dan suhu peralihan kaca, dimana kedua sifat tersebut meningkat dengan penambahan tanah liat berorgano, dimana kenaikan terhadap kekuatan tegangan sebanyak 214% dan 267% dengan penambahan hanya 5 wt% CTAB-mont PU dan ODA-mont PU.

ACKNOWLEDGEMENTS

First and foremost, I would like to extend my deepest praise to Allah S.W.T who has given me the patience, strength, determination and courage to complete this thesis.

I would like to express my appreciation to all of the individuals who contributed to this project, in particular, the chairman of my supervisory committee, Associate Professor Dr. Saari B. Mustapha, for his guidance, constructive comments, continuous support, and advice throughout the duration of this study. I extend my sincere thank to my members of the supervisory committee, Professor Dr. Wan Md Zin B. Wan Yunus, Dr. Suraya Abdul Rashid and Dr. Khairul Zaman B. Hj. Mohd. Dahlan for their supervision, support and suggestions. I also wish to express my appreciation to Mr. Mohd Hilmi B. Mahmood, this work could have not been complete without the aid of him.

Profound gratitude is also extended to Universiti Putra Malaysia (UPM), and Malaysian Nuclear Agency (Nuclear Malaysia) in providing the needed facilities and equipment. Sincere thanks are also extended due Mr. Mohd. Zahid, Mr. Rosley Che Ismail, Kamarolzaman Hussein and Ms. Rida Anak Tajau for their assistance and constructive advice during the experimental work

Last but not least, my deepest affection and gratitude goes to my dearest, sons, parents, my loving family and friends for their constant support and care that made things possible.

I certify that an Examination Committee has met on 15 November 2007 to conduct the final examination of Teuku Rihayat on his Doctor Of Philosophy thesis entitled “Development of Polyurethane/ Clay Nanocomposites Based on Palm Oil Polyol” In accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulation 1981. The Committee recommends that the candidate be awarded the relevant degree.

Members of the Examination Committee are as follows:

Robiah Yunus, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Chairman)

Fakhru’l-Razi Ahmadun, PhD

Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Luqman Chuah Abdullah, PhD

Associate Professor
Faculty of Engineering
Universiti Putra Malaysia
(Internal Examiner)

Zainal Ariffin Mohd. Ishak, PhD

Professor
School of Material & Mineral Resource Engineering
Universiti Sains Malaysia
(External Examiner)

HASANAH MOHD. GHAZALI, PhD

Professor/Deputy Dean
School of Graduate Studies
University Putra Malaysia.

Date : 29 January 2008

This thesis submitted to the Senate of University Putra Malaysia and has been accepted as fulfilment of requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee are as follows:

Saari Mustapha, PhD

Associate Professor
Faculty of Engineering
University Putra Malaysia
(Chairman)

Wan Md. Zin B. Wan Yunus, PhD

Professor
Faculty of Science
University Putra Malaysia
(Member)

Suraya Abd. Rashid, PhD

Lecturer
Faculty of Engineering
Universiti Putra Malaysia
(Member)

Khairul Zaman B. Hj Mohd. Dahlan , PhD

Malaysian Nuclear Agency
(Member)

AINI IDERIS, PhD

Professor and Dean
School Of Graduate Studies
University Putra Malaysia

Date : 21 February 2008

DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Putra Malaysia or other institutions.
