## LIST OF TABLE

2.1	The effect of tree foliage supplementation to low quality basal diet on intake and dry matter digestibility of cattle, sheep and goat	18
2.2	Chemical composition of mulberry (% of DM)	24
2.3	DM digestibility (DMD), protein digestibility and digestible energy of mulberry foliage	27
2.4	Effect of mulberry supplementation to different basal diets on the performance of different ruminant species	29
3.1	Type of diets used for evaluation	41
3.2	Composition of the diets (% of DM basis)	41
3.3	Chemical composition, IVTOMD at 24 and 48 h of incubation and <i>in vitro</i> gas production characteristics of feed ingredients	49
3.4	CP, gas production at 24 h incubation and energy content of the diets	51
3.5	Mean value of interaction between treatment and supplementation on fermentation kinetics of experimental diet	53
3.6	Effect of urea treatment and fermentable carbohydrate supplementation on IVTOMD (%), gas production (ml), substrate fermented (mg), PF (mg/ml), microbial biomass production (mg/100mg substrate fermented) derived from the incubation of 500 mg sample at 24 h	58
3.7	Effect of urea treatment and fermentable carbohydrate supplementation on pH of buffered rumen fluid, Total VFA production (mM) and proportion of VFA (%) of the diets after 24 h incubation	61
4.1	Ingredients and chemical composition of experimental diets	76
4.2	Means of dry matter intake (DMI) and nutrients digestibility in sheep fed different supplements	82
4.3	Means of Nitrogen (N) utilisation in sheep fed different supplements	83

4.4	Means of rumen ammonia nitrogen (NH <sub>3</sub> -N) levels and rumen pH at different sampling times of sheep fed different dietary supplements	84
4.5	Means of pH, rumen NH <sub>3</sub> -N, total VFA and proportion of VFA	85
4.6	Excretion of urinary PD (mM/d) and estimated daily MNS (g N/d) in sheep fed different dietary supplements	86
4.7	DM degradation characteristics of mulberry and rice bran incubated in the rumen of sheep fed different dietary supplements	88
4.8	CP degradation characteristics of mulberry and rice bran incubated in the rumen of sheep fed different supplements	90
4.9	DM degradability (%) and degradation characteristics of untreated rice straw (URS) and urea-treated rice straw (TRS) at different incubation times in the rumen of sheep fed different dietary supplements	92
4.10	Fiber (NDF) degradability (%) and degradation characteristics of untreated rice straw (URS) and urea-treated rice straw (TRS) incubated at different incubation times in the rumen of sheep fed different diets	93
5.1	Content (% DM basis) of tannin in <i>Leucaena</i> species and mulberry that were used in the study	109
5.2	Type of diets	109
5.3	Composition of feed ingredients (% DM basis), nutrients and metabolisable energy content of the experimental diets	115
5.4	Fermentation kinetics of mulberry, <i>Leucaena</i> and mulberry and <i>Leucaena</i> mixture	116
5.5	Estimates of <i>in vitro</i> true organic matter digestibility (IVTOMD), fermentable substrate, volume gas production derived from 24 h <i>in vitro</i> fermentation of 500 mg DM of the experimental diets	118
5.6	Estimates of apparent protein digestibility of mulberry, <i>Leucaena</i> and mixed mulberry and <i>Leucaena</i> after incubation for 24 h in rumen buffer media followed by acid pepsin digestion	119
5.7	Total production and proportions of VFA of mulberry, <i>Leucaena</i> and their mixture after 24 h incubation	122
5.8	Mean values of DMI and nutrient digestibility in sheep fed different supplementations	123

5.9	Nitrogen utilisation in sheep fed different supplements	124
5.10	Average rumen pH, ammonia-N ( $\text{NH}_3\text{-N}$ ), total VFA (volatile fatty acid) and proportion of VFA	127
5.11	Excretion of urinary purine derivatives (PD) (mM/d) and estimated daily microbial N supply in sheep fed the treatment diets	128
5.12	Average body weight and daily weight gain in lambs fed the treatment diets	129

## LIST OF FIGURES

2.1	Origin of principal metabolites in ruminants	12
2.2	Utilisation of protein and carbohydrate by rumen bacteria	36
2.3	Prediction of microbial cells and VFA production from kg glucose at increasing levels of microbial cell growth efficiency ( $Y_{ATP}$ )	37
3.1	Cumulative gas productions (ml/200mgDM) of feedstuff at different incubation times	50
3.2a	Cumulative gas production from untreated rice straw and mulberry diet supplemented with cassava chip and molasses	55
3.2b	Cumulative gas production from urea treated rice straw and mulberry diet supplemented with cassava chip and molasses	55
3.3	Relationship between gas production and VFA production of the experimental diet	70
4.1	DM degradability of mulberry (M) and rice bran (R) incubated in the rumen of sheep fed mulberry supplement (●) 50% mulberry were replaced by urea-rice bran mixture (■) and all mulberry were replaced by urea-rice bran mixture (▲)	88
4.2	Protein degradability of mulberry (M) and rice bran (R) incubated in the rumen of sheep fed mulberry supplement (●) 50% mulberry were replaced by urea-rice bran mixture (■) and all mulberry were replaced by urea-rice bran mixture (▲)	90
5.1	Cummulative gas production of mulberry, <i>Leucaena</i> and their mixture	117
5.2	Protein degradability of mulberry and <i>Leucaena</i> mixture in rumen buffered medium extrapolated from incubation of individual feed and measured by incubation of two feeds in different combination	120
5.3	Protein digestibility of mulberry and <i>Leucaena</i> mixture in acid pepsin solution media extrapolated from incubation of individual feed and measured by incubation of two feeds in different combination	121
5.4	The pH, $NH_3$ -N and total VFA of the rumen of sheep fed diet T0 (●), T1 (■) and T2 (▲) at 0, 2, 4 and 6 h post-feeding	126

and my beloved parents Soedjono and Soekini*

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in  
fulfilment of the requirement for the degree of Doctor of Philosophy

**EFFECTS OF MULBERRY (*Morus alba*) FOLIAGE SUPPLEMENTATION  
ON SHEEP FED WITH RICE STRAW**

By

**DWI YULISTIANI**

**January 2008**

**Chairman : Professor Zainal Aznam bin Mohd Jelan, PhD**

**Faculty : Agriculture**

Feeding of fibrous agricultural by-product is the most appropriate strategy to reduce the cost of feeding of ruminants. However, these by-products have low nutritive values and the use of tree foliages as supplement could improve the utilisation of these fibrous feeds. A study consisting of three experiments was conducted with the aim of enhancing the utilization of rice straw by supplementation of the diet with mulberry foliage in sheep.

The first experiment evaluated the effect of adding fermentable energy in the mulberry-rice straw basal diet by *in vitro* gas production technique. Molasses supplementation to mulberry-urea treated rice straw based (TRSM) significantly ( $P < 0.05$ ) improved fermentation of the diet as indicated by the increase in gas production, microbial biomass yield and proportion of propionic acid. Supplementation of molasses at 5% level was sufficient to improve fermentation of the diet.

The second experiment was carried out based on the result from the first experiment. It was postulated that mulberry supplementation also provide fermentable nitrogen

and energy in the rumen. Therefore in the second experiment was conducted to compare the effect of mulberry foliage or urea-rice bran mixture supplementation on nutrient digestibility, N utilization, rumen fermentation and fibre degradation. Sheep were fed urea treated rice straw basal diet and three different supplements namely; (i) mulberry, (ii) 50% of the mulberry replaced with urea-rice bran mixture and (iii) mulberry was replaced by to rice bran and urea. DMI, nutrient digestibility, nitrogen balance, and efficiency rumen microbial protein synthesis was similar in sheep fed on urea treated rice straw based diet supplemented by mulberry foliage or urea-rice bran mix. Hence, mulberry supplementation at 30% level in urea treated rice straw basal diet provided fermentable energy and protein. The rate of protein degradability of mulberry in the rumen was reduced in sheep fed mixed urea-rice bran supplement. Supplementation of mulberry or urea-rice bran mixed to urea treated rice straw basal diet resulted in similar fibre degradation of rice straw or urea treated rice straw. Hence, mulberry or urea-rice bran mixture offers an alternative source of fermentable nitrogen and energy to improve the utilisation of rice straw by sheep.

The third experiment determined the effect of mulberry and mulberry-leucaena foliage supplementation on feed utilization, rumen fermentation and growth of lambs fed urea-treated rice straw basal diet. In an *in vitro* gas production study, mulberry was mixed with either one of the two leucaena varieties (*Leucaena leucocephala* hybrid and *Leucaena leucocephala* local) at 2 levels (25 and 50%). Supplementation of leucaena to mulberry decreased *in vitro* true organic matter digestibility (IVOMD), the rate of gas production and protein digestibility in the rumen buffered medium. Protein digestibility in acid pepsin which is an estimate of protein availability in intestine was increased. Tannin derived from leucaena hybrid

supplementation to mulberry at ratio 1:1 was most effective level to decrease protein digestion in the rumen, but increased the protein digestibility in acid pepsin incubation. In a feeding trial, supplementation level at 30% of mulberry-leucaena mixture at the ratio of 1:1 to urea treated rice straw basal diet showed similar effect to mulberry or rice bran supplementation on nutrient digestibility, N balance, microbial protein synthesis and body weight gain. Hence, supplementation of either mulberry-*Leucaena* mixture or mulberry or urea-rice bran mixture provided the critically deficient nutrient required by rumen microbes to stimulate rumen fermentation digestion and thus the efficiency forage utilization.

It is concluded that mulberry utilization improved when molasses was also supplemented to the rice straw basal diet. In addition, mulberry supplementation also provided the fermentable energy and nitrogen. However, due to the rapid microbial fermentation of mulberry protein in the rumen, mixing of *Leucaena* that has high tannin content with mulberry could reduce protein degradability in the rumen (*in vitro*). Feeding of *Leucaena*-mulberry mixture had similar effect to mulberry supplementation on growth of lambs.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**STRATEJI SUPLEMENTASI MULBERI (*Morus alba*) FOLIAJ UNTUK BIRI-BIRI YANG DIBERI MAKANAN JERAMI PADI**

Oleh

**DWI YULISTIANI**

**January 2008**

**Pengerusi : Profesor Zainal Aznam bin Mohd Jelan, PhD**

**Fakulti : Pertanian**

Pemberian makanan daripada hasil sampingan pertanian yang berserat adalah strategi yang wajar untuk mengurangkan kos pemberian makanan ruminan. Walau bagaimanapun, hasil sampingan ini mempunyai nilai pemakanan yang rendah dan penggunaan foliaj pokok sebagai suplemen boleh meningkatkan penggunaan bahan makanan berserat ini. Satu kajian yang mengandungi tiga eksperimen telah dilakukan dengan tujuan untuk meningkatkan penggunaan jerami padi dengan suplementasi diet ini dengan foliaj mulberi pada biri-biri.

Eksperimen pertama telah menilai kesan penambahan tenaga terfermentasi dalam diet berasas mulberi-jerami padi melalui teknik produksi gas *in vitro*. Suplementasi molas pada mulberi-jerami padi terawat urea pada kadar 5% (TRSM) adalah bererti ( $P < 0.05$ ) untuk meningkatkan fermentasi diet seperti ditunjukkan oleh peningkatan pengeluaran gas, hasil biomas mikrob dan perkadaran asid propionik. Suplementasi molas pada paras 5% adalah cukup untuk meningkatkan fermentasi diet.

Eksperimen kedua menilai kesan suplementasi mulberi foliaj berbanding campuran urea-dedak padi ke atas pencernaan nutrient, kegunaan nitrogen, ciri-ciri fermentasi rumen dan degradasi serat. Biri-biri diberi diet berasas jerami padi urea terawat dan tiga suplemen berbeza berikut: (i) mulberi, (ii) 50% mulberi digantikan dengan campuran urea-dedak padi dan (iii) mulberi digantikan dengan campuran urea-dedak padi. Pengambilan makanan, pencernaan nutrient, imbalan nitrogen, efisiensi sintesis protein mikrob rumen adalah serupa pada biri-biri yang memakan jerami padi urea terawat dengan suplemen foliaj mulberi atau campuran urea-dedak padi.

Suplementasi mulberi pada aras 30% dalam diet berasaskan jerami padi urea terawat menyediakan tenaga terfermentasi dan protein. Kadar degradasi protein dalam rumen menurun dalam biri-biri yang memakan suplemen campuran urea-dedak padi. Suplementasi mulberi atau campuran urea-dedak padi kepada diet berasaskan jerami padi urea terawat menyebabkan kesan yang sama pada degradasi jerami padi atau jerami padi urea terawat. Oleh itu mulberi atau campuran urea-dedak padi memberi satu sumber alternatif nitrogen terfermentasi dan tenaga untuk meningkatkan penggunaan jerami padi pada biri-biri.

Eksperimen ketiga menentukan kesan suplementasi foliaj mulberi dan mulberi-leucaena ke atas penggunaan makanan, fermentasi rumen dan pertumbuhan anak biri-biri yang diberi makanan asas jerami padi urea terawat. Dalam kajian pengeluaran gas *in vitro*, mulberi telah dicampurkan dengan sama ada satu daripada dua variasi *Leucaena* (hybrid *Leucaena leucocephala* dan *Leucaena leucocephala* tempatan) pada 2 aras (25 dan 50%). Suplementasi *leucaena* kepada mulberi menurunkan pencernaan benar *in vitro* bahan organik (IVOMD), kadar produksi gas

dan pencernaan protein dalam rumen. Pencernaan protein dalam asam pepsin yang mengganggu ketersediaan protein dalam usus kecil telah meningkat. Tannin daripada hibrid *leucaena* yang disuplementasikan kepada mulberi pada nisbah 1:1 paling efektif untuk mengurangkan pencernaan protein dalam rumen, tetapi meningkatkan pencernaan protein dalam inkubasi asam pepsin. Dalam satu percubaan pemberian makanan, suplementasi campuran dengan nisbah 1:1 mulberry-*leucaena* pada paras 30% kepada diet berasaskan jerami padi urea terawat, menunjukkan kesan yang sama kepada mulberi atau suplementasi dedak padi ke atas pencernaan nutrien, keseimbangan N, sintesis mikrob rumen dan kenaikan berat badan. Oleh itu, suplementasi sama ada campuran mulberi-*leucaena* atau mulberi atau campuran urea-dedak padi menyediakan nutrien kritikal yang kurang dan diperlukan oleh mikrob rumen untuk merangsang fermentasi rumen dan efisiensi penggunaan foraj.

Adalah dirumuskan bahawa penggunaan mulberi meningkat apabila molas juga disuplementasikan kepada diet berasaskan jerami padi. Tambahan lagi, suplementasi mulberi juga menyediakan tenaga dan nitrogen terfermentasi. Walau bagaimanapun, disebabkan oleh fermentasi mikrob yang cepat pada protein mulberi dalam rumen, campuran *leucaena* yang mengandungi tannin yang tinggi dengan mulberry boleh mengurangkan degradasi protein di dalam rumen (*in vitro*). Pemberian campuran *leucaena*-mulberry memberi kesan yang sama dengan suplementasi mulberry pada pertumbuhan anak biri-biri.

## ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to my Supervisory Committee, Professor Dr. Zainal Aznam bin Mohd Jelan (Chairman), Professor Dr. Norhani Abdullah, Associate Professor Dr. Liang Juan Boo and Associate Professor Dr. Halimatun Yaakub for their invaluable supervision and encouragement throughout this study.

I am very grateful to the Agency of Agricultural Research and Development (AARD), Indonesia for giving me an opportunity and the scholarship to study for my PhD degree at UPM. I would also like to thank Dr. Kusumo Diwyanto and Dr. Abdullah Bamualim, the past and present Director of the Center Research Institute of Animal Science, respectively for their approval for me to pursue my career and Dr. Sofyan Iskandar, Director of Research Institute for Animal Production for his moral support during my study in Malaysia.

My deep appreciation goes to all lecturers and staff of the Dept of Animal Science, Faculty of Agriculture, UPM for their friendship and kind hospitality. Thanks are due to the staff of Nutrition Laboratory and Research Farm at Dept of Animal Science for their assistance. I would also like to thank my colleagues and post-graduate students at the Dept of Animal Science for their friendship. My special thanks to Dr. Bodee Kamsekiew for his assistance on sample analysis, Dr. Mohd Mainul Hasan, Mr. Arsadi Ali and Mr. Mohd Rafie for their support to conduct the field experiment and the Indonesian students who always provided help in time of hardships.

The two people I would like to express my deepest appreciation for their love and support are my beloved mother, Sukini and father, Soedjono. Your humble ways of life, patience and advice inspire all of your children for a greater achievement in life.

Finally, my deep gratitude is extended to my husband, Markus Anda and my children, Marulini Piadiata Salokang and Onesmus Hopijayanto Salokang for their patience, continuous support, understanding and encouragement throughout my study.

I certify that an Examination Committee met on 14<sup>th</sup> January 2008 to conduct the final examination of Dwi Yulistiani on her Doctor of Philosophy thesis entitled “Strategic supplementation of mulberry (*Morus alba*) foliage for sheep fed rice straw” in accordance with University Putra Malaysia (Higher Degree) Act 1980 and University Putra Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

**AZHAR B. KASIM, Ph.D.**

Associate Professor,  
Faculty of Agriculture  
University Putra Malaysia  
(Chairman)

**ABDUL RAZAK ALIMON, Ph.D.**

Professor,  
Faculty of Agriculture  
University Putra Malaysia  
(Internal Examiner)

**MOHD RIDZWAN B. ABDUL HALIM, Ph.D.**

Associate Professor,  
Faculty of Agriculture  
University Putra Malaysia  
(Internal Examiner)

**BOB ORSKOV, Ph.D.**

Professor Emeritus  
(External Examiner)
