#### EDGE-INTERIOR GRADIENT EFFECTS ON THE UNDERSTOREY BIRD COMMUNITY IN AN ISOLATED AYER HITAM FOREST RESERVE, MALAYSIA

By

## HOSSEIN VARASTEH MORADI

Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia, in Fulfilment of the Requirement for the Degree of Doctor of Philosophy

June 2009

## DEDICATION

Specially dedicated to:

My beloved family

Parisa and Ayda

My mother and my late father

Your love has made me a better and stronger person.

You are always in my heart.

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

### EDGE-INTERIOR GRADIENT EFFECTS ON THE UNDERSTOREY BIRD COMMUNITY IN AN ISOLATED AYER HITAM FOREST RESERVE, MALAYSIA

By

#### **HOSSEIN VARASTEH MORADI**

#### June 2009

#### Chairman: Associate Professor Mohamed Zakaria Hussin, PhD

Faculty: Forestry

The fact that the world is losing its biodiversity due to human activities, particularly around the tropical forest region, has been widely known. One of the biggest threats to biodiversity is the edge effects, especially in isolated and fragmented habitats. Thus, to investigate the edge effects on the community of understorey birds, an isolated tropical rainforest of Malaysia was chosen. The objectives of this study were: (1) to examine the species composition, richness, abundance, and density changes across edge-interior gradient; (2) to detect any distinct bird communities associated with certain habitat types and the factors affecting the association (3) to distinguish the interior and edge specialist species and guilds. The point-count sampling method was used in a 1248-ha lowland rainforest patch of Ayer Hitam Forest Reserve to carry out a survey on the individual understorey bird and species, at each of the 93 survey points, between December 2006 and July 2008.

Birds and environmental variables were recorded within a 25 m radius of each point. A total of 2263 observations, 72 species, representing 19 families were recorded in this study. The species composition, density, abundance, and diversity of birds showed some significant differences across the edgeinterior gradient at the guild and species levels. Based on the bird-habitat association, along the edge-interior gradient, two groups were distinguished. These were the edge-specialist group which was positively correlated with ground cover, light intensity, shrub cover, temperature, and percentage of shrub cover between 0.5 and 2 m in height; meanwhile the interior-specialist group was highly sensitive to the forest edge and could indicate good habitat quality of forest interior with high humidity, dense canopy cover, high number of dead trees, high percentage of litter cover, and deep litter layer. At the guild level, the results showed that the terrestrial insectivores and sallying insectivores are sensitive to edge and have positive correlation with distance from the edge, leaf litter depth, canopy cover, and the number of tall trees (>10 m). The presence of some species such as the Yellow-vented Bulbul, Cream-vented Bulbul, and Plaintive Cuckoo was associated with high light intensity and shrub cover, which are the best indicators of the edge. Meanwhile, the presence of Short-tailed Babbler, Moustached Babbler, and Black-caped Babbler was associated with high relative humidity and leaf litter cover, which are the best indicators of forest interior.

Changes in the micro-environment at the edge are a key factor to indicate the understorey avian responses to the edge-interior gradient. As edge

specialists can be widely found in the matrix surrounding the patch, they require less conservation against being declined or endangered; i.e. they can be well managed in the matrix surrounding the forest patches. Interiorspecialists, on the other hand, especially terrestrial insectivores, should be given the most attention in conservation of forest areas. From the conservation viewpoint, the forest remnants in the lowlands of Peninsular Malaysia are of considerable concern. Due to the characteristics including thick leaf litter layer, dense canopy cover, high number of dead trees, and high relative humidity, these remnants have the capability of supporting the understorey bird species sensitive to edge effects.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

#### KESAN GRADIEN PINGGIR-DALAM HUTAN TERHADAP KOMUNITY BURUNG DI PERINGKAT BAWAH HUTAN DI HUTAN SIMPAN TERPENCIL AYER HITAM, MALAYSIA

Oleh

#### **HOSSEIN VARASTEH MORADI**

#### Jun 2009

#### Pengerusi: Profesor Madya Mohamed Zakaria Hussin, PhD

Fakulti: Perhutanan

Dunia sedang mengalami kehilangan kepelbagaian biodiversitinya disebabkan aktiviti-akitiviti yang dijalankan oleh manusia terutamanya di kawasan hutan tropika. Salah satu ancaman yang besar kepada biodiversiti adalah kesan peminggiran terutamanya di habitat yang terpencil dan terasing. Sebuah hutan hujan tropika yang terpencil di Malaysia iaitu Hutan Simpan Ayer Hitam telah dipilih untuk mengkaji kesan peminggiran ke atas komuniti burung di bahagian bawah hutan. Objektif kajian ini adalah untuk: (1) mengkaji komposisi, kekayaan, limpahan, dan perubahan kepadatan spesies burung di sepanjang gradien pinggir hutan ke bahagian dalam hutan (2) mengesan sebarang perbezaan komuniti burung berkaitan dengan jenis habitat dan faktor-faktor yang menyebabkan perkaitan tersebut (3) membezakan spesies khusus dan 'guild' di bahagian dalam dan di pinggir hutan. Kaedah pensampelan 'point-count' digunakan untuk survei individu

dan spesies burung pada setiap 93 titik survei dari Disember 2006 hingga Julai 2008. Burung dan pembolehubah persekitaran dicatatkan dalam sekitar 25 m bagi setiap titik survei. Sejumlah 2263 pemerhatian yang terdiri daripada 72 spesies yang mewakili 19 famili burung dicatatkan. Komposisi, kepadatan, kelimpahan, dan kepelbagaian spesies burung menunjukkan beberapa perbezaan yang ketara di sepanjang gradien pinggir hutan dan bahagian dalam hutan pada peringkat 'guild' dan spesies burung. Dua kumpulan burung dapat dibezakan berdasarkan pada perkaitan habitat dan burung di sepanjang pinggir hutan dan bahagian dalam hutan. Kumpulan burung khusus di pinggir hutan berkait rapat secara positif dengan lapisan litupan tanah, intensiti cahaya, litupan pokok renek, suhu, dan peratusan litupan pokok renek yang berketinggian antara 0.5 hingga 2 m. Manakala kumpulan burung khusus di bahagian dalam hutan adalah sangat sensitif terhadap pinggir hutan dan boleh menjadi petunjuk kepada kualiti habitat yang baik di bahagian dalam hutan dengan kelembapan yang tinggi, kepadatan litupan kanopi, bilangan pokok mati yang banyak, dan peratusan litupan sampah yang tinggi dan lapisan yang tebal. Pada paras 'guild' burung, keputusan kajian menunjukkan insektivor terestrial dan insektivor 'sallying' adalah sensitif kepada pinggiran hutan dan mempunyai korelasi positif dengan jarak dari pinggir hutan, kedalaman daun sampah, litupan kanopi, dan bilangan pokok tinggi (>10 m). Kehadiran beberapa spesies burung seperti Merbah Kapur, Merbah Mata-putih dan Sewah Mati-anak yang berkait dengan intensiti cahaya dan litupan pokok renek adalah petunjuk kepada pinggir hutan yang baik. Manakala kehadiran Rimba Ekor-pendek,

Rimba Berjambang, dan Rimba Kopiah-hitam yang berkait dengan kelembapan relatif yang tinggi dan litupan daun sampah adalah petunjuk yang baik kepada bahagian dalam hutan.

Perubahan pada persekitaran mikro di pinggir hutan adalah faktor utama penyebab burung di bahagian bawah hutan respons kepada gradien pinggir ke dalam hutan. Kumpulan burung khusus di pinggir hutan merupakan spesies burung yang kebanyakannya wujud di kawasan matrix hutan pinggir. Oleh itu pemuliharaan mereka bukan menjadi perkara yang wajib dan jika beberapa spesies ini berkurangan atau terancam, mereka mungkin boleh diurus dengan lebih baik di kawasan sekitar matrix hutan pinggir. Manakala spesies khusus hutan dalam terutamanya insektivor terestrial, memerlukan perhatian yang tinggi bagi konservasi kawasan hutan. Dari perspektif pemuliharaan, saki baki hutan di kawasan tanah pamah di Semenanjung Malaysia yang mengandungi lapisan daun sampah yang tebal, litupan kanopi yang padat, bilangan pokok mati yang banyak, dan kelembapan relatif yang tinggi mempunyai nilai pemuliharaan yang tinggi kerana mereka boleh menampung spesies burung di peringkat bawah hutan yang sensitif kepada kesan pinggir hutan.

### AKNOWLEDGMENT

My gratitude.....

- to God Almighty for His blessed and Will.
- to the chairman of my Supervisory Committee, Assoc. Prof. Dr. Mohamed Zakaria Hussin; and also to the Supervisory Committee members, Prof. Dr. Mansour Mesdaghi, Assoc. Prof. Dr. Abdullah B Mohd, and Dr. Ebil Yusof, for their support and guides for completion of this thesis.
- to Gorgan University of Agricultural sciences and Natural resources for providing and permission to continue my study.
- to my friends Rajpar, Saber, Zamri, Suziana, Darishawati, Karl, And Geremy for helping during the data collection.
- to my father-in-low and mother- in-low, who took care of my family during my study.
- And finally, to my beloved wife and daughter, Parisa and Ayda, who were the main support and motivation for this achievement.

I certify that a Thesis Examination Committee has met on 30 June 2009 to conduct the final examination of Hossein Varasteh Moradi on his thesis entitled "Edge-interior Gradient Effects on the Understorey Bird Community in an Isolated Ayer Hitam Forest Reserve, Malaysia" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1988. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

#### Ahmad Ainuddin Nuruddin, PhD

Associated Professor Faculty of Forestry Universiti Putra Malaysia (Chairman)

### Ahmad Ismail, PhD

Professor Faculty of Science Universiti Putra Malaysia (Internal Examiner)

#### Ahmad Said Sajap, PhD

Professor Faculty of Forestry Universiti Putra Malaysia (Internal Examiner)

#### Zubaid Akbar Mukhtar Ahmad, PhD

Professor Faculty of Science and Food Technology Universiti Kebangsan Malaysia (External Examiner)

**BUJANG BIN KIM HUAT, PhD** 

Professor and Deputy Dean School of Graduate Studies Universiti Putra Malaysia

Date: 27 August 2009

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

### Mohamed Zakaria Hussin, PhD

Associate Professor Faculty of Forestry Universiti Putra Malaysia (Chairman)

### Mansour Mesdaghi, PhD

Professor Faculty of Natural Resources Gorgan University of Agricultural Sciences and Natural Resources, Iran (Member)

### Abdullah B Mohd, PhD

Associate Professor Faculty of Forestry Universiti Putra Malaysia (Member)

### Ebil Yusof, PhD

Lecturer Faculty of Forestry Universiti Putra Malaysia (Member)

### HASANAH MOHD. GHAZALI, PhD

Professor and Dean School of Graduate Studies Universiti Putra Malaysia

Date: 11 Sepetember 2009

## DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.

### HOSSEIN VARASTEH MORADI

Date: 28 July 2009
