FSAS 1991 1

ELECTRICAL TRANSPORT AND RELATED DIELECTRIC PHENOMENA IN COCONUT-SHELL ACTIVATED CARBON

By

W. MOHAMAD DAUD BIN W. YUSOFF

Thesis Submitted in Fulfilment of the Requirements for the Degree of Doctor of Philosophy in the Faculty of Science and Environmental Studies
Universiti Pertanian Malaysia

August 1991

UPM

ACKNOWLEDGEMENTS

I would like to express my gratitute to my supervisors, Professor Dr. Hj. Badri bin Muhammad and Dr. Mansor bin Hashim, for the invaluable guidance, continuing advice, encouragement and discussions they have given me throughout the course of this research.

I would also like to thank the following:

Dr. Sobri bin Hashim, Timbalan Ketua Pengarah of Unit Tenaga Nuklear, Bangi (until 1990) and his staff members for their kind help.

En. Abbas bin Ab. Rahman of Glass Blowing Workshop for his kind help.

En. Nordin bin Abdul Kadir and En. Shahsol Karib bin Kamaruddin of Mechanical and Electronic Workshop for their technical assistance.

Various colleagues and staff members of the Physics and Chemistry Department for their kind help and cooperation.

The Jabatan Perkhidmatan Awam and Universiti Pertanian Malaysia for finacial support and study leave.

My wife and children for their patience and understanding.

Abstract of thesis submitted to the Senate of Universiti Pertanian Malaysia in fulfilment of the requirements for the degree of Doctor of Philosophy.

ELECTRICAL TRANSPORT AND RELATED DIELECTRIC PHENOMENA IN COCONUT-SHELL ACTIVATED CARBON

By

W. MOHAMAD DAUD BIN W. YUSOFF

August 1991

Supervisors : Professor Dr. Hj. Badri bin Muhammad.
Dr. Mansor bin Hashim.

Faculty : Faculty of Science and Environmental Studies,
Universiti Pertanian Malaysia.

The electrical properties of coconut-shell activated carbon have not been thoroughly investigated and are, therefore, not well understood. In order to study these properties meaningfully, a fairly satisfactory knowledge of the structure, microstructure and composition of the material is needed.

Since the material's constitution has been little studied and dealt with in the relevant published literature, investigation of the structure and composition of the material has to be done in a comprehensive manner. The experimental investigation is divided into two categories. Firstly, the basic experimental work, which is considered important in order to provide supportive evidence to any proposed model of charge-carrier conduction and dielectric behaviour, consists of

work on x-ray diffractometry, neutron activation analysis, Fourier transform infra-red spectroscopy, scanning electron microscopy, thermoelectric power and magnetoresistance. Secondly, the main experiments consist of work on direct current conductivity and alternating current conductivity measurement.

The results of the basic experiments indicate that activated carbon prepared from coconut shells is essentially amorphous, containing many functional groups, potassium, sodium and several other trace elements. It has a highly porous microstructure. The thermopower-temperature plot obtained suggests that holes are the majority carriers below 385K while at higher temperatures electrons are the majority carriers.

The experimental results of the variation of the direct current conductivity with temperature and the dependence of the alternating current conductivity upon frequency at various fixed temperatures reveal three distinguishable regions. First, a variable-range hopping conduction mechanism operates among localised states near the Fermi level at temperatures below 200K; second, a hopping conduction mechanism occurs among localised states in the band tail for temperatures between about 200 and 385K and third, a percolation conduction mechanism is dominant at and above the mobility edge for temperatures above 385K. The graph of alternating-current conductivity versus

temperature shows that the conductivity is strongly influenced by a certain polarisation process. The results of dielectric-response measurements and the results of the equivalent-circuit analysis show that interfacial polarisation is the most probable process responsible for the observed dielectric behaviour.

Abstrak tesis yang dikemukakan kepada Senat Universiti Pertanian Malaysia bagi memenuhi syarat untuk ijazah Doktor Falsafah.

PENGANGKUTAN ELEKTRIK DAN FENOMENA DIELEKTRIK BERKAITAN DALAM KARBON AKTIF TEMPURUNG-KELAPA

Oleh

W. MOHAMAD DAUD BIN W. YUSOFF

Ogos 1991

Penyelia : Professor Dr. Hj. Badri bin Muhammad.
: Dr. Mansor bin Hashim.

Fakulti : Fakulti Sains dan Pengajian Alam Sekitar,
Universiti Pertanian Malaysia.

Sifat elektrik bagi karbon aktif dari tempurung kelapa didapati tidak diselidiki secara menyeluruh, oleh yang demikian sifat tersebut tidak diketahui dengan sepenuhnya. Untuk menyelidiki sifat elektrik ini secara bermakna, sedikit sebanyak pengetahuan tentang struktur, mikrostruktur dan kandungan bahan adalah diperlukan.

Oleh kerana sifat bahan hanya sedikit sahaja diketahui dan hanya boleh diperolehi dari penerbitan ilmiah yang bersesuaian, maka penyelidikan dari segi struktur dan kandongan bahan perlu dilakukan secara menyeluruh. Penyelidikan eksperimen ini terbahagi kepada dua kategori. Pertama, eksperimen asas, yang dianggap mustahak bagi menyokong sebarang cadangan model untuk kekonduksian pembawa-cas dan sifat dielektrik; iaitu pembelauan sinar-x, analisis pengaktifan neutron, spektroskopi jelmaan

Fourier infra-merah, mikroskop elektron imbasan, kuasa termoelektrik dan magnetorintangan. Kedua, eksperimen utama yang terdiri dari pengukuran kekonduksian arus terus dan kekonduksian arus ulang alik.

Hasil eksperimen asas menunjukkan karbon aktif yang disediakan dari tempurung kelapa adalah bersifat amorfus, mengandungi banyak kumpulan berfungsi, kalium, naterium dan beberapa jumlah kecil unsur-unsur lain. Ianya juga mempunyai mikrostruktur dengan keliangan yang tinggi. Dari plot termokuasa melawan suhu didapati lohong adalah pembawa cas utama pada suhu di bawah 385K sementara pada suhu tinggi elektron adalah pembawa utama.

Hasil eksperimen perubahan kekonduksian arus terus terhadap suhu dan pergantungan kekonduksian arus ulang alik terhadap frekuensi pada beberapa suhu tertentu menunjukkan mekanisma kekonduksian dalam karbon aktif tempurung-kelapa terbahagi kepada tiga bahagian. Pertama, mekanisma kekonduksian loncatan julat-berubah berlaku di antara keadaan-keadaan tempatan yang berhampiran dengan paras Fermi pada suhu di bawah 200K; kedua, mekanisma kekonduksian loncatan berlaku di antara keadaan-keadaan tempatan dalam daerah jalur ekor untuk suhu sekitar 200 hingga 385K dan ketiga, mekanisma kekonduksian perkolasi yang menonjol pada dan bahagian atas sisi kelincahan untuk suhu melebihi 385K.

Graf kekonduksian arus ulang alik terhadap suhu menunjukkan kekonduksian sangat dipengaruhi oleh proses pengutupan tertentu. Hasil pengukuran sambutan-dielektrik dan hasil analisis litar-setara menunjukkan pengutupan antaramukaan adalah berkemungkinan besar bertanggungjawab bagi tabiat dielektrik yang diamati.

CHAPTER I

THE BASIS AND OBJECTIVES OF THIS RESEARCH

Activated carbons which are porous carbonaceous materials have been the subject of numerous laboratory investigations, particularly adsorption studies. A literature survey on the properties of activated carbon shows that the investigations were largely concerned with the materials' chemical behaviour. Only a few papers have been published on the studies on their physical properties. The latter type of study is mainly focused on the microscopic nature of electrical conduction. In addition, most of the works on the electrical properties of carbonaceous materials have been carried out on graphite, coke, carbon black and amorphous carbon thin films. Activated carbon (charcoal) prepared from biological materials such as wood, coconut shells, bamboo etc. have been the subject of still fewer electrical investigations. In this work, a material of this type will be the object for an experimental analysis.

At the outset, however, it must be stated that the research work will commence with a material whose structural details are far from clear, except for a generally accepted picture of disordered turbostratic structure (Mattson and Mark Jr., 1971).
