Thesis Submitted to the School of Graduate Studies, Universiti Putra Malaysia, in Fulfilment of the Requirements for the Degree of Doctor of Philosophy

October, 2003

DEDICATION

To My Father with respect and Love I dedicate this work

Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirements for the degree of Doctor of Philosophy

STRUCTURAL AND DIELECTRIC PROPERTIES OF SUBSTITUTED STANNATE COMPOUNDS

By

IFTETAN AHMAD TAHA

October, 2003

Chairman: Professor Abdul Halim Shaari, Ph.D.

Faculty: Science and Environmental Studies

The alkaline-earth stannates having the general chemical formula $MSnO_3$ (M = Ca, Sr and Ba) have been projected as potential electronic ceramics such as thermally stable capacitors, humidity sensor, carbon dioxide sensor. There is no reliable technical information on the effect of substitutional doping on $MSnO_3$ system that appears to exist in the published literature. In view of the information gaps in the reported research, vigorous and systematic investigation has been carried out on two systems; SrSnO₃ and Mg₂SnO₄.

The two systems $Mg_{2-x}M_xSnO_{4\pm\delta}$ where M = Ca and Nb and $Sr_{1-x}N_xSnO_{3\pm\delta}$ where N = Ba, La and Zn, have been thoroughly studied with respect to synthesis, processing and characterisation – physical, microstructural and electrical. Conventional solid state technique has been used in the preparation of the samples. Two sintering temperatures are employed for $Mg_{2-x}M_xSnO_{4\pm\delta}$ system; 1300 °C for 24 h and 1500 °C for 6 h. While for $Sr_{1-x}N_xSnO_{3\pm\delta}$ system the

sintering temperatures are 1300 °C for 24 h and 1400 °C for 12 h. The effect of substitutional doping and sintering temperature on the structural, microstructural and dielectric properties of the two systems have been studied

The results of the X-ray diffraction analysis on the $Sr_{1-x}N_xSnO_{3\pm\delta}$ system revealed that a single-phase solid solution has formed with Ba as substitutional element. The system has low solid solubility when substituted with La and Zn. The results of the XRD analysis on the $Mg_{2-x}M_xSnO_{4\pm\delta}$ system showed that a single phase solid solution has formed with Nb – substituted sample up to x = 0.05. The system has low solid solubility when substituted with Ca.

Scanning electron micrographs of the samples for all the compositions in the $Mg_{2-x}M_xSnO_{4\pm\delta}$ and $Sr_{1-x}N_xSnO_{3\pm\delta}$ systems, in general showed that the grains were spherical in shape and associated with some degree of porosity. In some samples even after sintering at temperature as high as 1500 °C / 6 h, there is still some degree of porosity. For Ca-substituted sample with x = 0.4 sintered at 1500 °C / 6 h, the shape of the grains has totally changed from spherical to cubic.

A thorough analysis of the measured electrical data in the frequency range of 10^{-2} to 10^{6} Hz for Sr_{1-x}N_xSnO_{3±δ} samples substituted with Ba and La showed that the effect of changing sintering temperature and duration from $1300 \text{ }^{\circ}\text{C} / 24$ h to $1400 \text{ }^{\circ}\text{C} / 12$ h has resulted in a decrease in the relative permittivity and loss tangent. In Nb-substituted Mg_{2-x}M_xSnO_{4±δ} samples with $0 \le x \le 0.1$ increasing sintering temperature to $1500 \text{ }^{\circ}\text{C} / 24$ h has resulted in the increase of the relative permittivity. In general, low capacitance, high resistance (in the order of 10^{9} -

iv

 $10^{10}\Omega$) and low dielectric loss were the most observed features of all compositions in the two systems under study.

The equivalent circuit of $Sr_{1-x}Ba_xSnO_3$ and $Sr_{1-x}La_xSnO_{3\pm\delta}$ samples with x = 0, 0.1, 0.2, 0.4, 0.6, 0.8 and 1 samples sintered at 1300 °C / 24 h can be expressed by the combination of parallel network of quasi-dc, dipole, and C_{inf} in series with the electrode resistance (Rs)

STRUKTUR DAN SIFAT DIELEKTRIK BAGI SEBATIEN STANNAT GANTIAN

Oleh

IFTETAN AHMAD TAHA

Oktober 2003

Pengerusi: Profesor Abdul Halim Bin Shaari, Ph.D.

Sains dan Pengajian Alam Sekitar Fakulti :

Stannat-alkalin-bumi yang mempunyai formula kimia am MSnO₃ (M=Ba, La dan Zn) telah diutarakan sebagai seramik elektronik yang berpotensi seperti kapasitor stabil terma, sensor kelembapan, sensor karbon dioksida. Tiada maklumat teknikal yang boleh dipercayai kesan penggantian keatas sistem MSnO₃ yang boleh didapati daripada sorotan ilmiah. Memandangkan terdapat jurang maklumat dalam penyelidikan yang telah dilaporkan, satu kajian sistematik dan mendalam telah dijalankan keatas sistem, SrSnO3 dan Mg2SnO4.

Kedua-dua sistem tersebut iaitu $Mg_{2-x}M_xSnO_{4\pm\delta}$ dengan M=Ca dan Nb, dan Sr₁. _xN_xSnO_{3±δ} dengan N=Ba, La dan Zn, telah dikaji sepenuhnya dari segi sintesis, pemerosesan dan penentuan ciri fizik, mikrostruktur dan elektrik. Teknik keadaan pejejal lazim telah digunakan dalam penyediaan sampel. Dua suhu pensinteran telah digunakan untuk sistem $Mg_{2-x}M_xSnO_{4\pm\delta}$: iaitu 1300 °C selama 24 jam dan 1500 °C untuk selama 6 jam. Sementara untuk sistem Sr_{1-x}N_xSnO_{3±8}, suhu

vi

sintering adalah 1300 °C selama 24 jam dan 1400 °C untuk selama 12 jam. Kesan penggantian pendopan dan suhu sinteran keatas struktur, mikrostruktur dan ciri elektrik sistem tersebut telah dikaji.

Keputusan analisis pecahan sinar-X keatas sistem $Sr_{1-x}N_xSnO_{3\pm\delta}$ menunjukkan satu larutan pepejal fasa tunggal telah terbentuk dengan Ba sebagai unsur gantian. Sistem tersebut mempunyai kelarutan pepejal yang rendah bila digantikan dengan La dan Zn. Keputusan analisis XRD keatas sistem $Mg_{2-x}M_xSnO_{4\pm\delta}$ telah menunjukkan bahawa satu larutan pepejal fasa tunggal terbentuk pada sampel yang digantikan dengan Nb sehingga 0.05 sistem ini mempunyai larutan pepejal yang apabila digantikan dengan Ca.

Mikrograf imbasan elektron keatas sampel untuk semua kandungan dalam sistem $Mg_{2-x}M_xSnO_{4\pm\delta}$ dan $Sr_{1-x}N_xSnO_{3\pm\delta}$, secara umumnya menunjukkan butiran adalah berbentuk sfera dan berkait rapat dengan darjah keporosan. Terdapat juga sampel yang masih menunjukkan darjah keporosan walaupun disinter pada suhu setinggi $1500 \,^{\circ}\text{C} / 6$ jam. Untuk sampel gantian Ca dengan x = 0.4 yang disinter pada suhu 1500 °C / 6 jam dari berubah bentuk sfera ke kubus.

Satu analisis yang menyelurah bagi data elektrik yang diukur dalam julat frekuensi 10^{-2} hingga 10^{6} Hz untuk sampel Sr_{1-x}N_xSnO_{3±8} yang digantikan dengan Ba dan La menunjukkan bahawa kesan peningkatan suhu sinteran dari 1300 °C / 24 jam hingga 1400 °C/ 12 jam telah menyebabkan penurunan dalam ketelusan relatif dan kehilangan tangen. Dalam Mg_{2-x}M_xSnO_{4±6} yang digantikan oleh Nb dengan $0 \le x \le 0.1$ persinteran sehingga 1500 °C / 24 jam telah menghasilkan

vii

penambahan ketelusan relatif. Secara umum, kapasitan rendah, kerintangan tinggi (pada peringkat 10^9 - $10^{10} \Omega$) dan kehilangan dielektrik rendah adalah sifat yang paling banyak dicerap bagi semua komposisi di dalam sistem yang dikaji.

Litar setara bagi sistem $Sr_{1-x}Ba_xSnO_3$ dan $Sr_{1-x}La_xSnO_{3\pm\delta}$, dengan x = 0, 0.1, 0.2, 0.4, 0.6, 0.8 dan 1 yang disinter pada 1300 °C/ 24 jam boleh diungkap secara kombinasi rangkaian selari kuasi-dc, dwikutub dan C_{inf} sesiri dengan rintangan elektrod (Rs).

ACKNOWLEDGEMENTS

Firstly, I am very grateful to "ALLAH" s.w.t. for giving me the strength, and patient to complete this research within the specified time.

It is my pleasure to extend my sincere gratitude to, Professor Dr. Abdul Halim Shaari for his continuos supervision, guidance. Also I want to express my acknowledgment to my co-supervisor Associate Professor Dr. Wan Mohd. Daud Wan Yusoff for his assistance and fruitful discussion. I am also pleased to thank my co-supervisor Professor Dr. Lee Chnoong Kheng for her comments, suggestions throughout the research work

I am grateful to all the lecturers in the Physics Department for their kindness. Special thanks are due to Dr. Noorhana Yahya and Dr. Jumiah Hassan, for their assistance, discussion and moral support.

I would like to express my sincere gratitude to my lab mates: Dr. Imad Hamadneh, Ms. Ari Sulistyo Rini, Zohra, Mr. Kabashi, Mr. Mustafa, Mr. Ali, Mr. Ramadan, Mrs. Azizah, Mrs. Halema, Ms. Huda, Mr. Som and also I want to thank all postgraduate students in the Physics Department.

I want to thank Ms. Azilah, Mrs. Faridah, Mr. Ho and all members of Electron Microscopy Unit, UPM for their kind assistance.

My very special thanks go to my family in Iraq, my father Prof. Ahmad Al-Haje Taha from Mosul University, Iraq, my mother for her prayer for me and my kids, my lovely sisters, my brother-in-law, Mr. Radwan for their support from far.

Finally, I want to thank my husband Associate Professor Dr. Waleed A. Thanoon from Faculty of Engineering for his generous support and assistance during my studies. Thanks to my kids Dalia, Kaldoon and Zadoon for their love, understanding and time they missed their mother.

May Allah Bless You All

I certify that an Examination Committee met on 2nd October to conduct the final examination of Iftetan Ahmad Taha on her Doctor of Philosophy thesis entitled "Structural And Dielectric Properties Of Substituted Stannate Compounds" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

Dr. Zainal Abidin Talib, Ph.D.

Associate Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Chairman)

Dr. Ibrahim Abu Talib, Ph.D.

Professor, School of Applied Physics, Faculty of Science and Technology Universiti Kebangsaan Malaysia. (External Examiner)

Dr. Abdul Halim Shaari, Ph.D.

Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

Dr. Lee Choong Kheng, Ph.D.

Professor, Department of Chemistry, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

Dr. Wan Mohd. Daud Wan Yusoff, Ph.D.

Associate Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

GULAM RUSUL RAHMAT ALI, Ph.D. Professor/Deputy Dean School of Graduate Studies Universiti Putra Malaysia

Date: 9 JAN 2004

This thesis submitted to the Senate of Universiti Putra Malaysia has been accepted as fulfillment of the requirements for the degree of Doctor of Philosophy. The members of the Supervisory Committee are as follows:

Dr. Zainal Abidin Talib, Ph.D.

Associate Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Chairman)

Dr. Abdul Halim Shaari, Ph.D.

Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

Dr. Lee Choong Kheng, Ph.D.

Professor, Department of Chemistry, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

Dr. Wan Mohd. Daud Wan Yusoff, Ph.D.

Associate Professor, Department of Physics, Faculty of Science and Environmental studies, Universiti Putra Malaysia. (Member)

AINI IDERIS, Ph.D. Professor/ Dean, School of Graduate Studies Universiti Putra Malaysia

Date : 21 JAN 2004

DECLARATION

I hereby declare that the thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at UPM or other institutions.

6.12:	Variation of relative permittivity for Mg _{2-x} Nb _x SnO _{4±δ} samples sintered at 1500 °C for 6 h as a function of frequency at 25 °C (a) for $0.01 \le x \le 0.05$; (b) for $0.2 \le x \le 0.8$	132
6.13:	Variation of loss tangent (tan δ) for Mg _{2-x} Nb _x SnO _{4±δ} samples sintered at 1500 °C for 6 h as a function of frequency at 25 °C (a) for 0.01 \leq x \leq 0.05; (b) for 0 \leq x \leq 0.8	: 133
6.14:	Variation of relative permittivity ε_r for Mg _{2-x} Nb _x SnO _{4±δ} ($0 \le x \le 0$) samples sintered at 1300 °C for 24 h and 1500 °C for 6 h as a function of Nb concentration at 1 kHz	.05) 134
6.15:	Variations of C', C'' for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ samples ($0 \le x \le 0.1$) sintered at 1300 °C for 24 h measurement taken at 25 °C	136

6.16:	Variations of ε ', ε '' for Mg _{2-x} Nb _x SnO _{4±δ} samples ($0 \le x \le 0.8$) sintered at 1300 °C for 24 h measurement taken at 25 °C	138
6.17 :	Impedance for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ samples (0.01 $\leq x \leq$ 0.8) sintered at 1300 °C for 24 h mesurment taken at 25 °C	143
6.18:	Modulus for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ samples (0.01 $\leq x \leq 0.8$) sintered at 1300 °C for 24 h mesurment taken at 25 °C	146
6.19:	Impedance plots for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ (where $0 \le x \le 0.05$) samples sintered at 1500 °C for 6 h measurement taken at 25 °C	3 148
6.20:	Modulus plot for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ (where $0 \le x \le 0.05$) samples sintered at 1500 °C for 6 h measurement taken at 25 °C	149
6.21:	Frequency response of AC conductivity of Mg _{2-x} Nb _x SnO _{4±δ} samples (where $0 \le x \le 0.1$) sintered at 1300 °C for 24 h mesurmet taken at 25 °C	nt 151
6.22	Frequency response of AC conductivity for $Mg_{2-x}Nb_xSnO_{4\pm\delta}$ samples ($0 \le x \le 0.8$) sintered at 1500 °C for 6 h mesurment taken at 25 °C	152
6.23:	Variation of relative permittivity for $Sr_{1-x}Ba_xSnO_3$ samples ($0 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C, (a): at all frequencies range; (b) at high frequencies only	
6.24:	Variation of tan δ for Sr _{1-x} Ba _x SnO ₃ samples ($0 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C, (a): at all frequencies range; (b) at high frequencies only	155
6.25:	Variation of relative permittivity ε_r for $Sr_{1-x}Ba_xSnO_3$ samples (where $0 \le x \le 1$) sintered at 1400 °C for 12 h as a function of frequency at 25 °C: (a) all frequencies range; (b) at high frequence only	ies 157
6.26:	Variation of $\tan \delta$ for $Sr_{1-x}Ba_xSnO_3$ samples (where $0 \le x \le 1$) sintered at 1400 °C for 12 h as a function of frequency at 25 °C, (a): at all frequencies range; (b) at high frequencies only	158
6.27:	Variation of experimental and theoretical value obtained from equivalent circuit of C', C'' for $Sr_{1-x}Ba_xSnO_3$ samples (where $0 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C	159
6.28:	Equivalent circuit model represents dielectric response for Figure 6.27	161

xxi

6.29:	Frequency response of real and imaginary permittivity (ϵ ', ϵ '') of Sr _{1-x} Ba _x SnO ₃ samples (where $0 \le x \le 1$) sintered at 1300 °C for 24 h	165
6.30:	Frequency response of ε ', ε '' of Sr _{1-x} Ba _x SnO ₃ (where $0 \le x \le 1$) samples sintered at 1400 °C for 12 h	167
6.31:	Impedance plots for $Sr_{1-x}Ba_xSnO_3$ (where $0 \le x \le 1$) samples sintered at 1300 °C for 24 h measurement taken at 25 °C	170
6.32:	Modulus plots for Sr_{1-x} sintered at 1300 °C for 24 h measurement taken at 25 °C	172
6.33:	Spectroscopy plots for $Sr_{1-x}Ba_xSnO_3$ samples sintered at 1300 °C for 24 h measurement taken at 25 °C	175
6.34:	Impedance plots for $Sr_{1-x}Ba_xSnO_3$ samples (where $0 \le x \le 1$) sintered at 1400 °C for 12 h measurement taken at 25 °C	178
6.35:	Variation of log σ_{ac} for Sr _{1-x} Ba _x SnO ₃ samples (where $0 \le x \le 1$) sintered sintered at 1300 C for 24 h as afunction of frequency at 25 °C	181
6.36:	Variation of log σ_{ac} for Sr _{1-x} Ba _x SnO ₃ samples (where $0 \le x \le 1$) sintered at 1400 °C for 12 h as a function of frequency at 25 °C	181
6.37:	Variation of relative permittivity for $Sr_{1-x}La_xSnO_3$ samples (where $0 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C, at all frequencies range; (b) at high frequenc only.	ies 184
6.38:	Variation of loss tangent $(\tan \delta)$ for $Sr_{1-x}La_xSnO_{3\pm\delta}$ (where $0 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C, at all frequencies range; (b) at high frequencies only	185
6.39:	Variation of relative permittivity for $Sr_{1-x}La_xSnO_{3\pm\delta}$ samples $(0 \le x \le 1)$ sintered at sintered at 1400 °C for 12 h as a function of frequency at 25 °C	186
6.40:	Variation of tan δ for Sr _{1-x} La _x SnO _{3±δ} samples ($0 \le x \le 1$) sintered at 1400 °C for 12 h as a function of frequency at 25 °C	186
6.41:	Variation of experimental and theoretical value obtained from equivalent circuit of C', C'' for $Sr_{1-x}La_xSnO_{3\pm\delta}$ samples sintered at 1300 °C for 24 h as a function offrequency at 25 °C	189
6.42:	Equivalent circuit model represent dielectric response for Figure 6.41 (a and f)	192

6.43:	Frequency response of real and imaginary permittivity (ϵ ', ϵ '') of Sr _{1-x} La _x SnO _{3±\delta} samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h	193
6.44:	Impedance plots for $Sr_{1-x}La_xSnO_{3\pm\delta}$ samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h measurement taken at 25 °C	196
6.45:	Modulus plots for $Sr_{1-x}La_xSnO_{3t\delta}$ samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h measurement taken at 25 °C	198
6.46:	Combined spectroscopic plots of M ^{\cdot} and Z ^{\cdot} for Sr _{1-x} La _x SnO _{3±δ} samples sintered at 1300 °C for 24 h as a function of frequency at 25 °C	199
6.4 7 :	Variation of log σ_{ac} for Sr _{1-x} La _x SnO _{3±δ} samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C	203
6.48:	Variation of log σ_{ac} for Sr _{1-x} La _x SnO _{3±δ} samples (where $0.1 \le x \le 1$) sintered at 1400 °C for 12 h as a function of frequency at 25 °C	204
6.49:	Variation relative permittivity for $Sr_{1-x}Zn_xSnO_3$ samples (where $0.1 \le x \le 1$) sintered at 1300 °C / 24 h as a function of frequency at 25 °C	207
6.50:	Variation tan δ for Sr _{1-x} Zn _x SnO ₃ samples samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C: (a) at all frequencies range; (b) at high frequencies only	208
6.51:	Frequency response of real and imaginary permittivity (ϵ ', ϵ '') of Sr _{1-x} Zn _x SnO ₃ samples (where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h	209
6.52	Impedance plots for $Sr_{1-x}Zn_xSnO_3$ samples (where $0.1 \le x \le 1$) samples sintered at 1300 °C for 24 h measurement taken at 25 °C	212
6.53	Variation of log σ_{ac} for Sr _{1-x} Zn _x SnO ₃ samples(where $0.1 \le x \le 1$) sintered at 1300 °C for 24 h as a function of frequency at 25 °C	214
7 .1:	TGA, DTA and DTG curves of the Mg-Sn precursor gel	216
7.2:	Infrared spectra of Mg_2SnO_4 : (a) dried gel, powders calcined at: (b) 300 °C, (c) 600 °C, (d) 800 °C, and (e) 1000 °C	217
7.3:	XRD patterns for powders prepared by sol-gel route calcined at different calcination temperatures	219
7.4:	Diagrammatic representation of the composition of MgO and SnO_2 grains at various stages of calcination	221
7.5:	XRD pattern for samples prepared by solid – state route (SS) and sol gel route (SG) sintered in air at 1200 °C for 24 h	221
