

The Optimization of Generating Plants in a Microgrid: The Covenant University Electric Power Network Experience

By

**OROVWODE Hope Evwieroghene
(CUGP060191)**

(ND (FPI), B.Eng, M.Eng UNIBEN)

A THESIS SUBMITTED IN THE DEPARTMENT OF
ELECTRICAL AND INFORMATION ENGINEERING TO
THE SCHOOL OF POSTGRADUATE STUDIES
IN PARTIAL FULFILLMENT OF THE REQUIREMENTS
FOR THE AWARD OF DOCTOR OF PHILOSOPHY OF
COVENANT UNIVERSITY, CANAANLAND, OTA, OGUN
STATE, NIGERIA

January, 2015

CERTIFICATION

This is to certify that the Thesis titled “The Optimization of Generating Plants in a Microgrid: The Covenant University Electric Power Network Experience” by OROVWODE Hope Evwieroghene (Matric. Number CUGP060191), is an original research work and meets the requirements and regulations governing the award of Doctor of Philosophy (Ph.D) in Electrical Engineering and is approved for its contribution to knowledge and literary presentation.

Supervisor: Prof. A.O. Adegbenro

DEDICATION

This thesis is dedicated to the Almighty God – the Secret and Root of wisdom, understanding and knowledge. Also, I dedicate this thesis to the memories of my late beloved mother, Mrs. Janet Palmer Orovwode, who saw the beginning of this work but did not live to see the end. May her gentle soul rest in perfect peace, Amen.

ACKNOWLEDGEMENTS

To the Father above, God Almighty, I express my utmost gratitude and appreciation for the gift of life, wisdom, intellect and grace that saw me through the research and writing of this Thesis. His guidance and inspiration are unquantifiable. I am grateful to the Chancellor of Covenant University, Dr. David Oyedepo, whose vision to establish this University has provided me the opportunity to embark on the Ph.D programme.

I wish to acknowledge the immense contributions of my former co-supervisor, late Prof. J. C. Ekeh, whose motivation gave me a sense of direction in this research. He saw the beginning but he is no more to witness how it ended. May God grant you eternal rest for all the labour of love you bestowed on me, amen.

My special thanks go to my supervisor, Prof. A. O. Adegbenro who is not tired of my mistakes. His encouragement, support and drive made me always want to work to complete the Ph.D programme. Words are not enough to express my gratitude to my co-supervisor, Prof. C.O.A. Awosope for his patience, guidance, encouragement and constant push. His hands midwife this Thesis. I am proud to have worked under your supervision. You are a great father and mentor.

I am also grateful to the Head of Electrical and Information Engineering (EIE) Department, Dr. F.E Idachaba for his advice and willingness to stand by me at all times even when I am discouraged. To all my friends and colleagues in EIE (too numerous to mention), just writing a bit of lines would not be able to say what you mean to me. God bless you all.

Finally, I want to appreciate my dearest wife, Martha E. Orovwode and my son, Oghenekparobo for all the sacrifices, care and for watching back while I was on the Ph.D programme. God's glory will not cease to shine upon you. The Pastor and members of Mountain of Fire and Miracles Ministries Atan 1, I appreciate the constant prayers, deliverance and encouraging ministrations.

TABLE OF CONTENT

Table of Contents	v
Abbreviations	x
List of Figures	xii
List of Tables	xvi
Abstract	xviii

Chapter One

Introduction

1.1	Overview of Global Electricity	1
1.2	Background	2
1.3	Motivation for the study	10
1.4	Significance of the study	11
1.5	Aim and objectives	12
1.6	Research method	13
1.7	Contribution to knowledge	13
1.8	Scope and limitation	13
1.9	Thesis organization	14

Chapter Two

Literature Review

2.1	Review of Electric Power Situation in Nigeria	15
2.2	Requirements of the 21 st century power system	16
2.3	Operational Pattern of Portable Generating Units	18
2.4	Power Supply in Covenant University	20
2.5	Diesel Generating plants	21
2.6	The Covenant University Electric Power Network (CUEPN)	21
2.7	The challenges of the CUEPN	23
2.8	Making a case for Re-Engineering of CUEPN	26
2.9	The Microgrid option	27
2.9.1	The Microgrid Concept	27
2.9.2	Requirements for operating a microgrid	29
2.9.3	Benefits for operating a microgrid	30
2.10	The microgrid technology	31
2.10.1	Microgrid Research & Development activities in some countries around the World	32
2.11.	Microgrid Components	35
2.12	The Proposed DC microgrid (DC μ G) solution	39
2.13	Observations and Findings from Literature review.	40

Chapter Three

The Power Network Requirements, Development and Modeling

3.1	The Power Network Development	41
3.1.1	The goals of the newly proposed electric power network arrangement	42
3.1.2	The Electrical Distribution Layout and the Facilities' Locations	44

3.1.3	Covenant University Load profile Analysis	45
3.1.4	Power Balance Evaluation	49
3.1.5	Power Network Control Technique	49
3.1.6	Required Equipment Determination	51
3.2	Modeling of the Microgrid Components	51
3.2.1	Microsources Model	51
3.2.2	Rectifier Model	52
3.2.3	Modeling of the Inverters	78
3.3	Power Network Arrangement Modeling	103
3.4	Distribution Line Model	111
3.5	Inter-links between Generators and Loads in the Microgrid	112

Chapter Four

	Optimization of the Power Generating Plant in the Microgrid	114
4.1	Fuel Consumption Characteristics of the Power Generators	114
4.2:	The Optimization Problem Formulation	118
4.2.1	The Fuel Cost Function	118
4.2.2	Carbon-Based Pollutant Emission Cost Equation	119
4.2.3	The Objective Cost Function	119
4.2.4	System Operating Constraints	120
4.3	The Solution to the Optimization Problem	124
4.3.1	Classical Methods	125
4.3.2	Non – Classical methods	126
4.3.3.	Hybrid Models Methods	126
4.3.4	The optimization Algorithm	127

Chapter Five

Simulation of the Optimized CUEPN Using Homer®

5.1	Simulation, Sizing and Optimization of the proposed CUEPN	130
5.2	Input data	131
5.2.1	System architectures	131
5.2.2	Electrical primary load	134
5.3	Presentation of results	137
5.4	System Reports - CUEPN proposed network optimization (ACS)	141
5.5.	System Report - CUEPN proposed network optimization (DCS)	147
5.6:	Discussion of results	156
5.6.1	Plant engagement	156
5.6.2	Analysis of Battery Energy Flow	158
5.6.3	Analysis of Fuel Consumption	151
5.6.3	Electricity Production Analysis	162
5.6.4	Carbon dioxide (CO ₂) emission analysis	164

Chapter Six

Conclusion, Achievements and Recommendations for Further Research

6.1	Summary of Work Done	169
6.2	Major Achievements	170
6.3	Adaptability of the Research Work	171
6.4	Recommendations for Further Research	172

ABSTRACT

The use of fossil fuel in electricity generation has created three significant issues for the world to deal with. The issues are security (availability and reliability) of supply, climate change and the cost of fuel required for electricity generation. Covenant University, currently running a cluster of stand-alone diesel powered generating plants situated at different locations within the campus has a lot of unused available capacity within the system which invariably increases the operating (fuel) cost of power generation and also contributes to the environmental pollution through the emission of greenhouse gases within the campus. This research work, using a bottom-up approach, developed a new Electric Power network arrangement by integrating the power generators into a microgrid where there would be a common pool of energy sources for all the loads attached to the power network. The network operational functionality and a developed optimized dispatch algorithm were simulated in Matlab to select generators based on their operating parameters to serve the required loads. Hybrid System Optimization Model for Electric Renewables (HOMER 2.81) software was used as the simulation, sizing and optimization tool to evaluate the performance of the developed network. This method minimized the unused capacity being wasted by reducing power plant engagement and consequently reducing the cost of fuel and carbon-based environmental pollution from the power generators that are operated in the campus. This, in turn, should encourage greenness, curbed pollution, and enhances system security and reliability. The fuel cost and emission were reduced by as much as 44.3% and 51.8% respectively. Consequently, for the specific problem identified in the operation of the Covenant University Electric Power Network, a model was developed to solve it. The developed model, in all its intent and purposes, can be generalized; that is, it can be applied to any cluster of independent dissimilar power generating plants.
