Economies of scale in biogas and organizational consequences: Common case study

October 28, 2014

**Joint BioChain and BioValueChain workshop October
27-29, 2014 Aarhus University, Foulum**

Henrik Klinge Jacobsen

WP1
Value chain optimisation

Scale effects – economies of scale

- Collection costs and density of resources
 - trade off between distance and size of resource

- Scale of biogas plant
 - economies of scale - capex expected

- Scale of upgrading facility and costs
 - storage cost
 - small scale no upgrade
 - large scale upgrade opex and capex

Trade off between rising operational and transport costs against reduced capital costs

Cost contribution and scale 12½% sugar beet

Transport costs: Tree scales of plant size and 3 cases of sugar beet inputs

- **Cost consist of transport time and loading**
 - Loading costs independent of scale but much higher for beet
 - Transport time only dependent on distance (50 km/h)
 - Capacity of beet carrier slightly lower than for manure but hourly costs also lower
- **Scaling up the plant size**
 - Per unit cost increase for all 3 cases because average transport distance increase: from 6 km to 10 km for manure 100%; from 23 km to 61 km for beet in the 12½% case; and from 43 km to 71 km in the 25% case
- **Increasing the share of beet**
 - With increased beet share the unit cost increase a lot - *since the unit cost for beet transport is much higher than for manure*
 - For high beet share the unit cost also increase faster with larger plant size - *because the effect of increased transport distance is more pronounced for beet (especially from 110-320kt)*

Tree scales of plant size and 3 cases of sugar beet inputs

Rising transport cost per unit of specific input

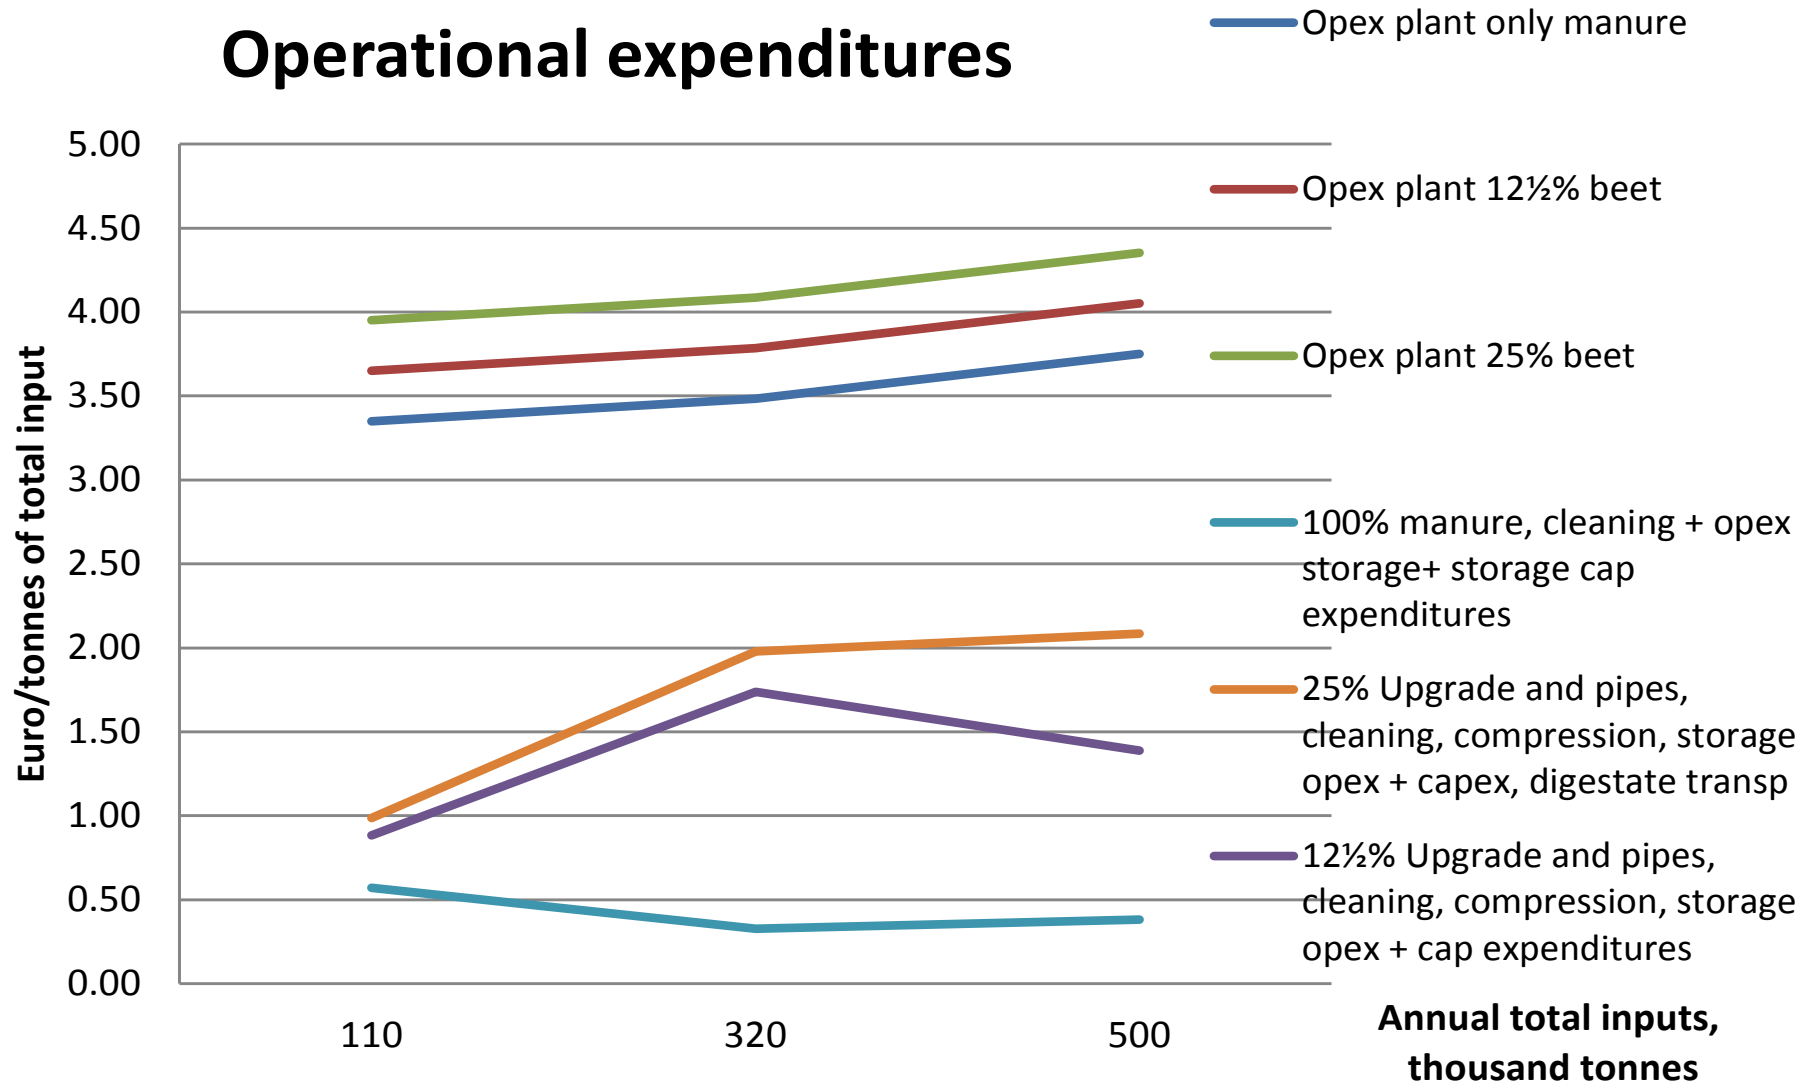

Tree scales of plant size and 3 cases of sugar beet inputs

Rising transport cost per unit of input

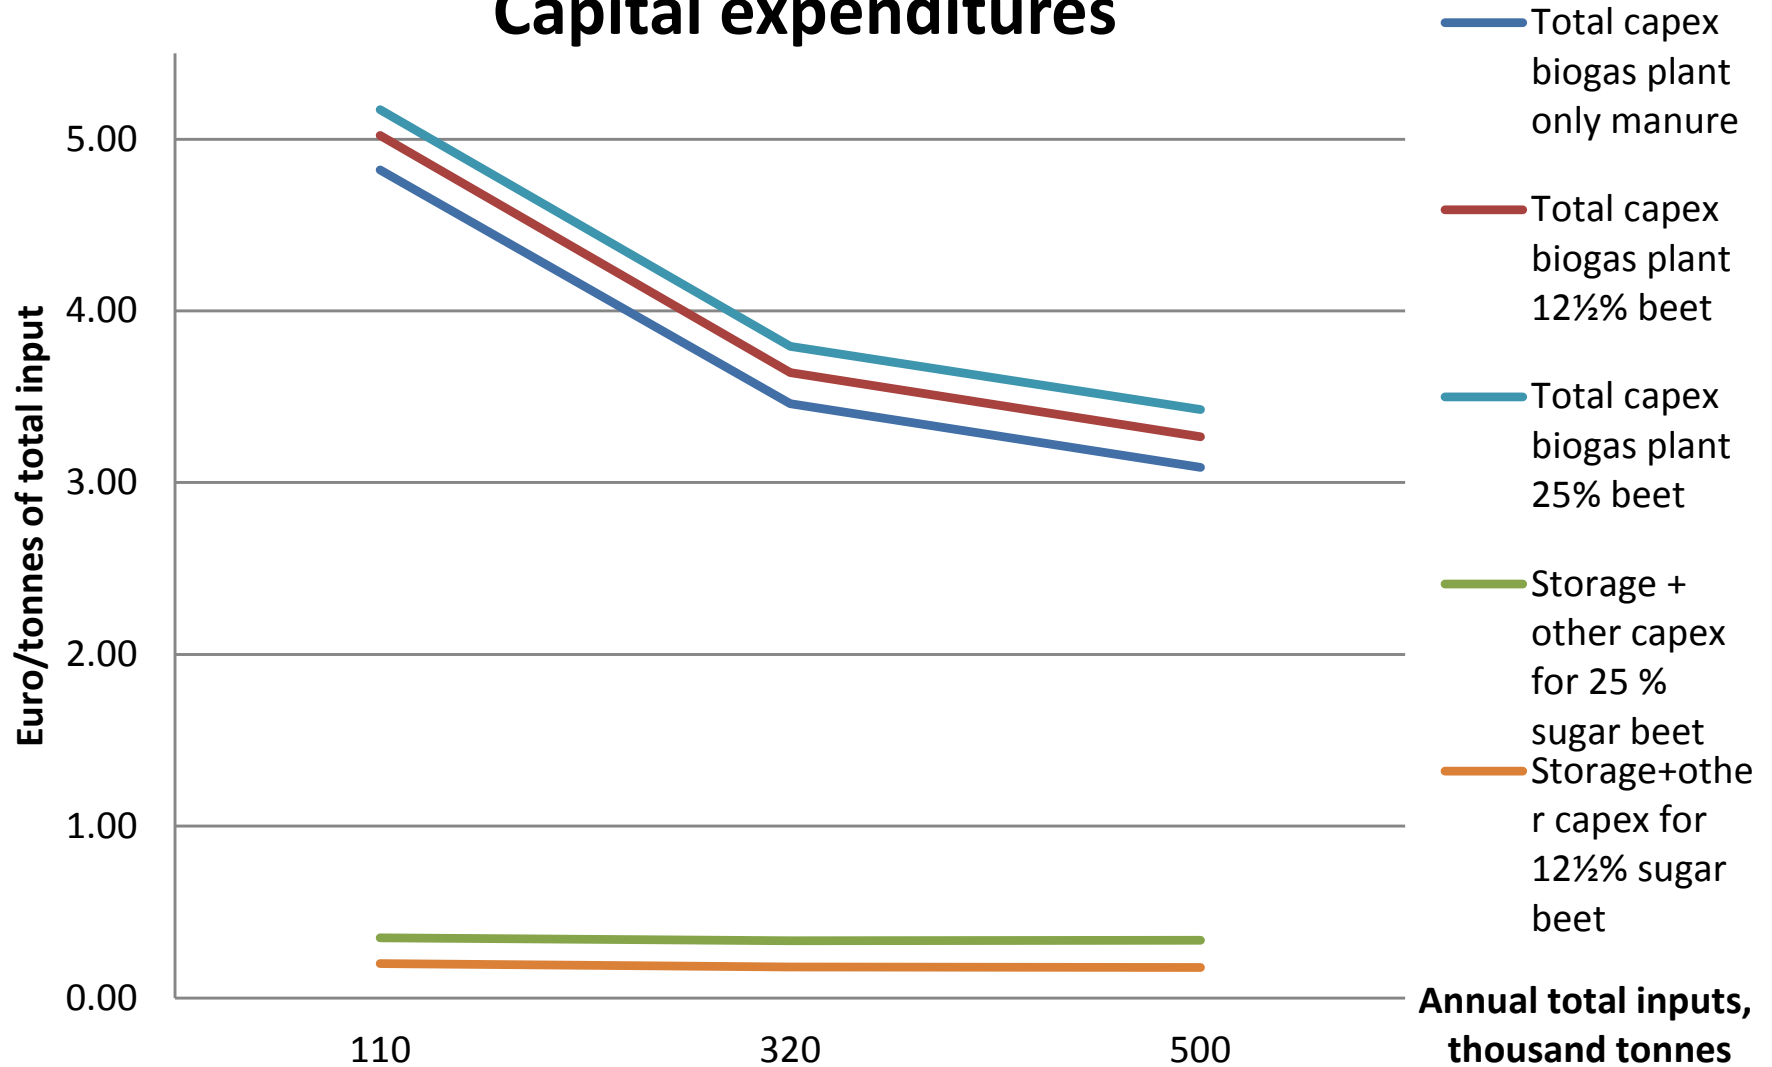

Operational expenditures

Operational expenditures and scale effects

- **Operational costs constitute an important part of total costs**
 - includes wages and salary (also for handling of inputs - transport)
 - includes other material inputs than input to biogas reactor
 - includes process heat and electricity
- **Scaling up the plant size**
 - Scale effects for opex at plant are slightly negative as they increase the unit costs (this deserves more attention/check)
- **Increasing the share of sugar beet**
 - only increases the plant unit costs proportionally for all the plant sizes
- **Scaling up plant size involves additional opex at output level**
 - cleaning of gas, storage very little for pure manure
 - cleaning, upgrade and compression (losses) increase when scale shifts to upgrade for natural gas grid
 - shift involve negative scale effect - but from 320 to 500kt positive scale effect for 12½% sugar beet (due to capex of upgrade facility)

Capital expenditures

Capital expenditures show large economies of scale effects

- **Plant size and capex**

- Economies of scale primarily achieved for this cost component
- Largest effect from 110 - 320kt size
- This scale effect outweighs the negative scale effects from transport costs and the slightly negative effect from opex

- **Increasing the share of sugar beet**

- adds a proportional cost per unit due to investment in storage and pretreatment/handling equipment
- no cost advantages or disadvantages of scale in this investment (could be further investigated)

Sensitivity and main parameters

- **Transport costs**

- Concentration of input resources in general - farm structure and economic conditions
- Sugar beet will be cultivated closer to plant in time

- **Input costs**

- Price of manure - uncertainty high and regulation dependent (environmental, animal restrictions)
- Price of sugar beet - dependent on alternative use (biofuel) and cost of alternatives (for cattle etc.) - world market links

- **Output**

- Volume - uncertainty of given process should be low? at annual output level
- Price of gas - for upgraded quantity the uncertainty in this 1/3 of revenue is high
- Price support - if granted/approved it is stable
- Price digestate etc. - high uncertainty

Scale effect in total

All costs, Euro/Tonnes			
Ratio\Scale	110	320	500
0/100	15.89	14.75	14.87
12½/87½	20.69	20.91	20.91
25/75	25.90	26.60	26.95

The cost advantage from capex declining is outweighed by rising operational and transport costs

Scale effect conclusion

- Cost reducing effect in scaling biogas plant size 110 00 to 500 00 tonnes (capex per input unit is reduced 35%, 0/100 mix)
- Negative scaling effect for transport costs (increase 45% for manure and 96% for sugar beet)
- Net effect (trade-off) result in equal costs per unit of the 320 000 t case and the 500 000 t case:
 - the benefit of scaling to 500 000 t (biogas plant capex + upgrade plant capex) is outweighed by the increase in transport costs

Positive scale effects are only dominating the net result for the pure manure case

Overall economic results

Net-income, Euro/Tonnes			
Ratio\Scale	110	320	500
0/100	-0.42	0.72	0.78
12½/87½	3.99	4.23	4.23
25/75	-4.34	-4.68	-5.03

Table 1 Net annual result per tonnes of inputs

The case with the highest profit is the 12½ % sugar beet case with a capacity of 500000 tonnes even though there are no particular scale effect here
