Project description

Objectives:

- Assess potential of lidars for power performance verification offshore. Could it replace a mast?

Method:

- Two different lidars:
 - Sector scanning lidar (Windcube 100S) on turbine transition piece platform
 - Nacelle mounted lidar (Wind Iris)
- IEC compliant met mast for reference

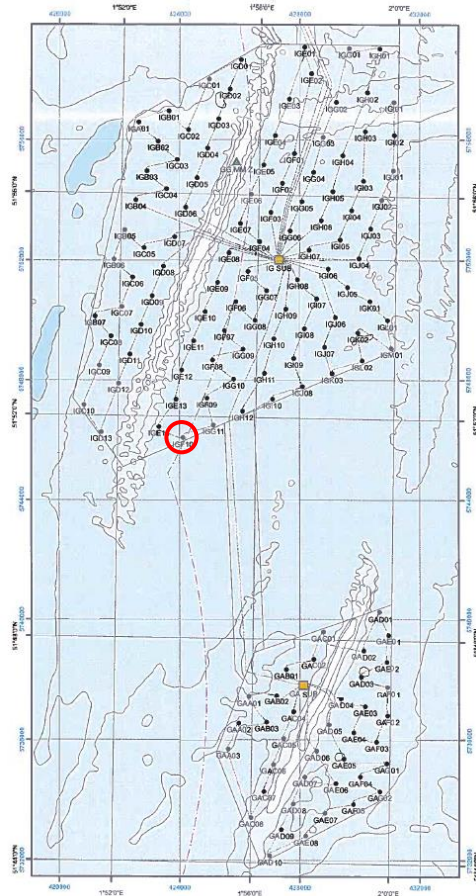

Outline

- Project description
- Lidars calibration
- Offshore deployment/measurement set up
- Availability of lidars' data
- Measurement height
- Comparison lidars/cup anemometer
- Power curves and AEP
- Uncertainties

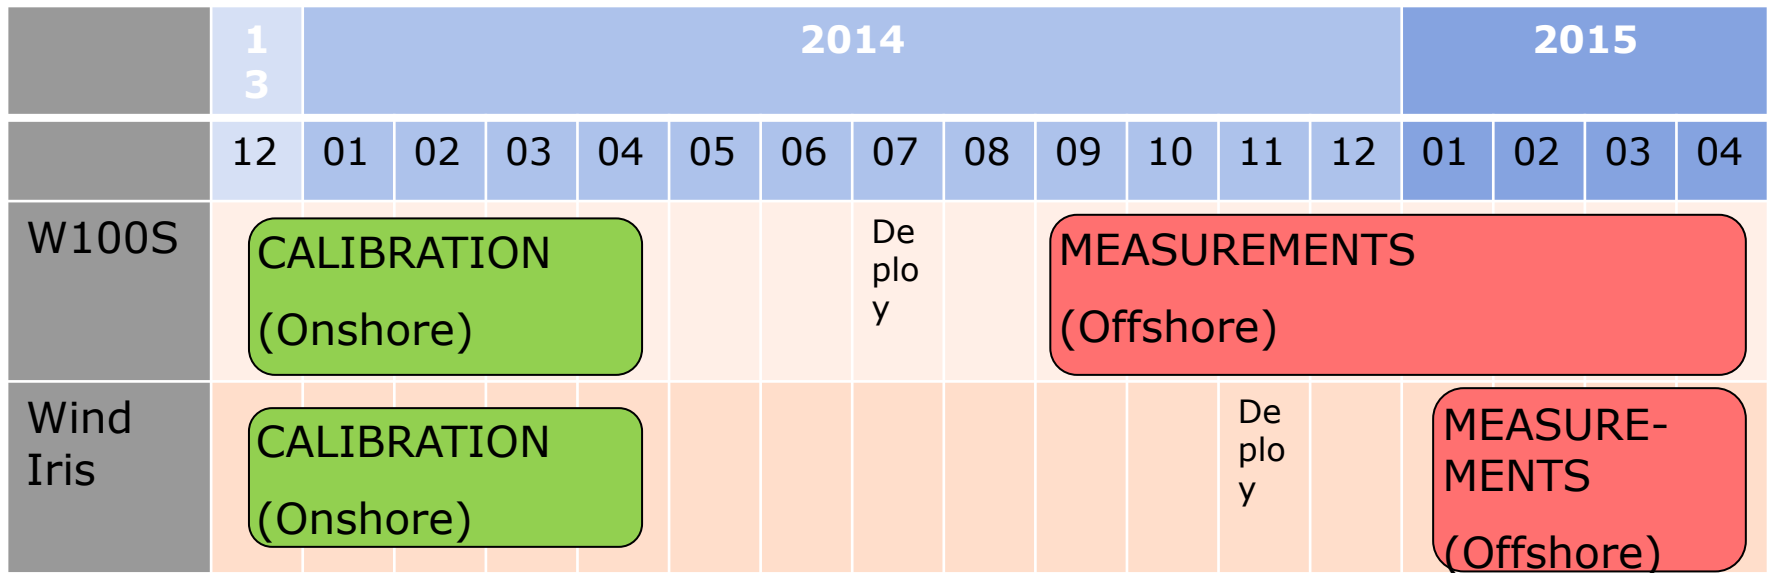

Project place

Greater Gabbard Offshore Wind Farm (GGOWL) in Lowestoft, Suffolk

Project timeline

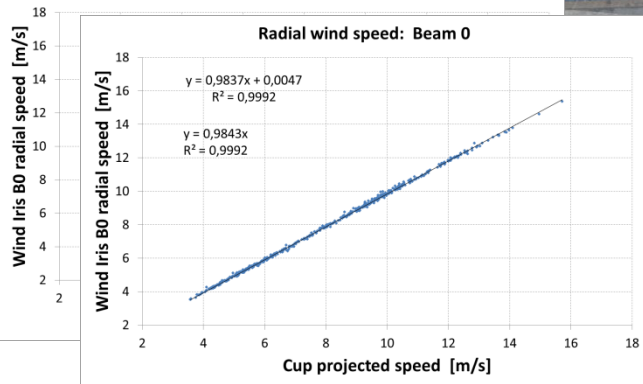

Lidars calibration at Høvsøre

Radial wind speed: Beam 1

Radial wind speed: Beam 0

- Inclinometers offset
- Radial wind speed along 2 LOS [1]
- Horizontal wind speed measurement uncertainty: 1.7% to 2.9%
- 4 months

- Inclinometers offset [2]
- Reconstructed horizontal wind speed
- Horizontal wind speed measurement uncertainty: 1.9% to 2.9%
- 3.5 months

Windcube 100S

Offshore deployment

IEC compliant met mast

Windcube 100S

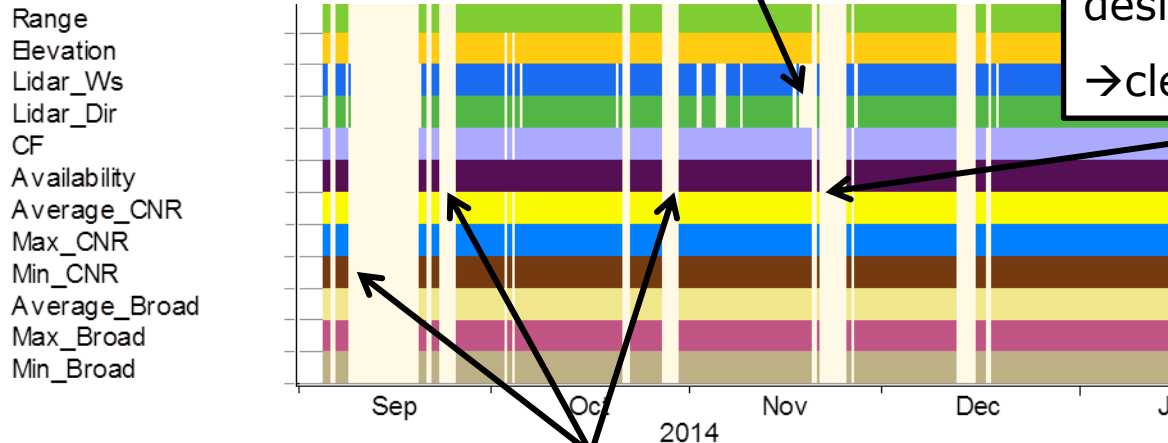

Data availability

Wind Iris : 100%

Windcube 100S : 77%

Condensation on the scanning head window

→ replacement of desiccant bag

→ cleaning of window

Lidar technical problems
→reboot (remotely)

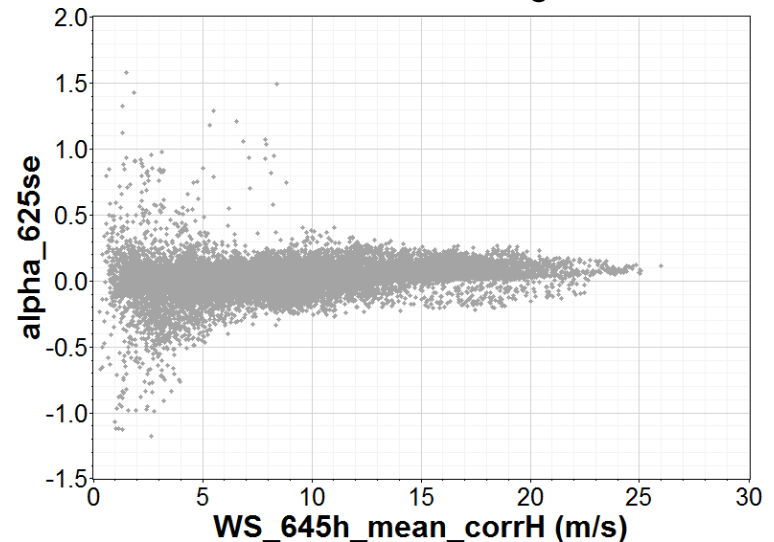

Sensing height for Wind Iris nacelle lidar

- Measuring above hub height
 - Optical head inclination adjusted to account for height of device and variations in tilt
 - But challenging adjustment as top of turbine is moving a lot (monopile foundation)
- Variations due to motion of turbine nacelle

Beam height relative to hub height

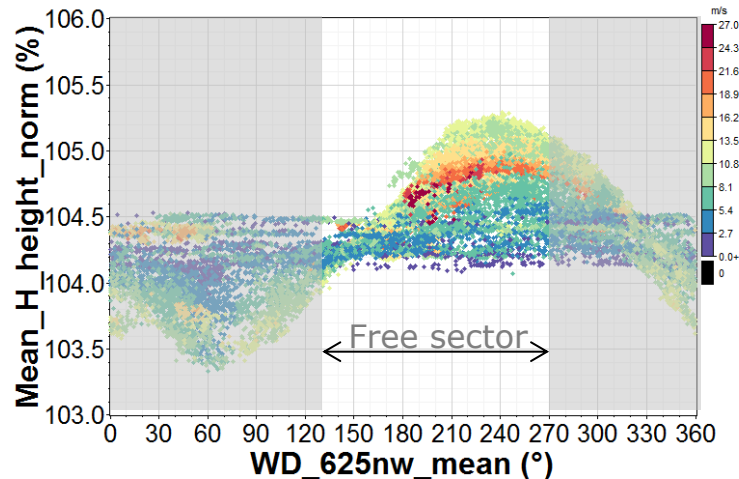

Alfa mast vs hub height WS

Sensing height for Windcube 100S

- Measuring above hub height (and above 2.5% of hub height)
- Scanning head elevation angle was slightly increased in order to avoid hitting the mast
- Variations due to motion of turbine and TP

Beam height relative to hub height

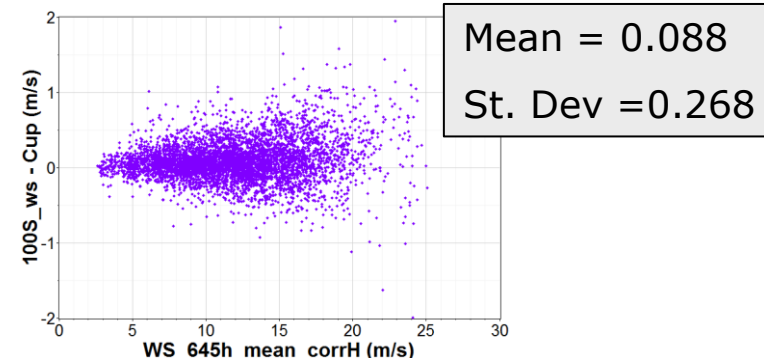

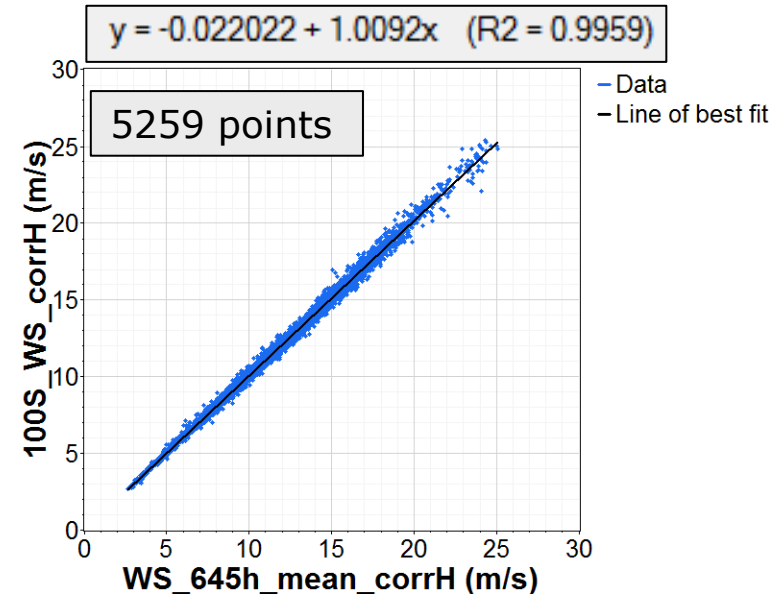

Windcube 100S/top cup comparison

Wind speed

Filters:

- wind sector: 128° -274°
- Lidar confidence factor (CF) in 10 min > 85%
- Turbine Available and free of failure
- Cup concurrent with Lidar

- Wind sector reduced compared to IEC sector in order to keep the full scan free from wakes
- Good comparison on average; 0.7% higher wind speed
- Spread increasing with wind speed
 - Similar observation during calibration

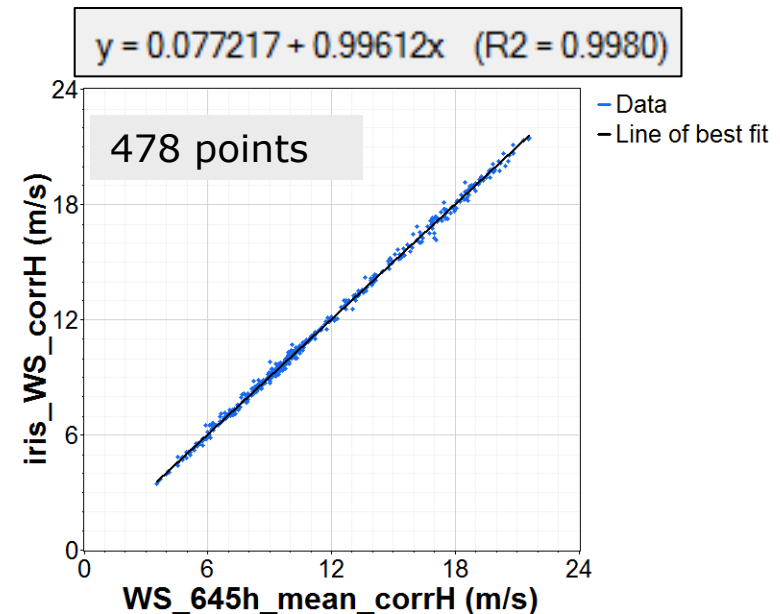

Wind Iris/top cup comparison

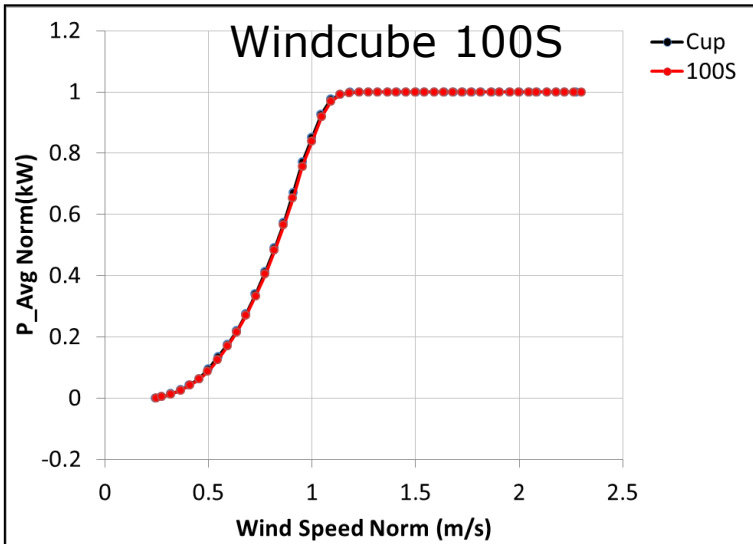

Filters:

- IEC power curve wind sector
- Radial wind speed availability:
RWS0 > 0.55 and RWS1 > 0.60
- Turbine Available and free of failure
- Cup concurrent with Lidar

- Good comparison on average
- Spread smaller than the Windcube 100S
 - Always measuring upstream[3]
 - Smaller dataset

Power curves and AEP

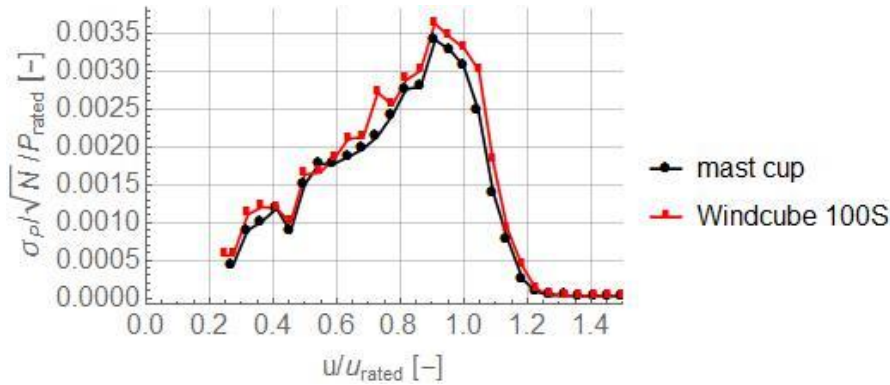

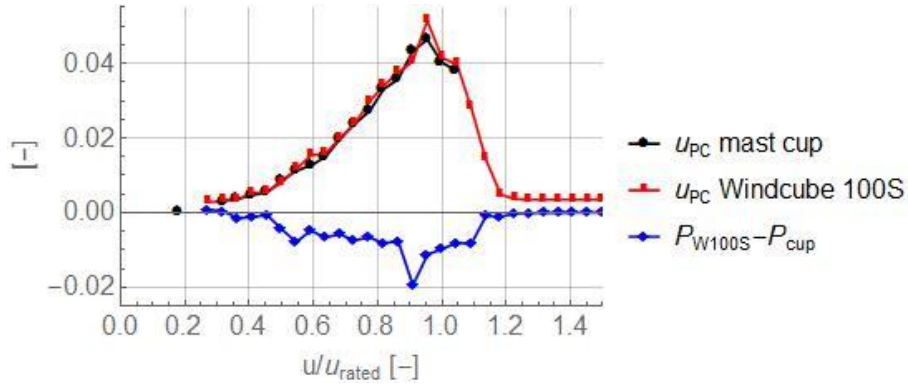

Hub height annual average wind speed	AEP relative to cup AEP
m/s	[%]
4.0	97.20%
5.0	97.75%
6.0	98.21%
7.0	98.57%
8.0	98.86%
9.0	99.13%
10.0	99.42%
11.0	99.72%

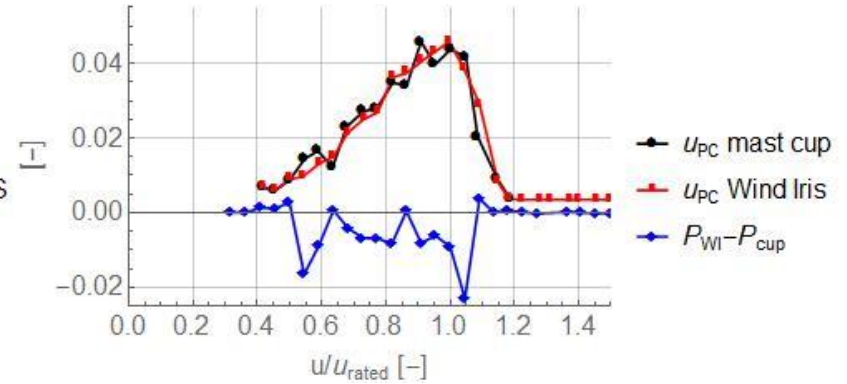

Hub height annual average wind speed	AEP relative to cup AEP
m/s	[%]
4.0	97.96%
5.0	98.22%
6.0	98.56%
7.0	98.85%
8.0	99.06%
9.0	99.22%
10.0	99.34%
11.0	99.42%

Uncertainty

Windcube 100S

Wind Iris

What drives uncertainty?

Cup anemometer

1. Calibration
2. Class (operational)
3. Mounting
4. Data acquisition

Wind Iris

1. Calibration [1]
2. Sensing height
3. Inclinator

- power curve cup (WindSensor 1.31)
- Wind Iris all
- ◆— Wind Iris calib
- ▲— lidar calib cup (Thies 0.9)

Similar approach
and results for the
Windcube 100S

Conclusions

- Generally good availability of data;
- but need proper monitoring and possibility of fast maintenance

- Good comparison lidar/mast on average
- Lidars power curves uncertainty very close to cup power curve uncertainty
 - Lower uncertainty of cup used for calibration of lidars than cup used for the power curve

- Using lidars for power performance verification require a calibration before deployment offshore (couple of months)
- Lidar deployment faster and cheaper than mast
 - Challenge: setting up height accurately
- None of these techniques is formally accepted by the new IEC standard 61400-12-1 ver.2 Draft CDV

From the perspective of the end user

- Significant CAPEX saving
- Encouragement that uncertainties are comparable to mast
- Challenge going forward – reduce uncertainties further
- Question - long-term operability of lidars if being viewed as a permanent mast replacement. What is the OPEX cost?

Project finalisation

- Measurement campaign on-going for a couple of months
- Report about results for a concurrent dataset
 - Publically available
 - Expected in May 2015

Acknowledgment

To colleagues in DTU who have helped with the data analysis

To technical staff from DTU, SSE and GGOWL who took care of the lidar installation and maintenance
