Concept

<1% reflected

SEM-image (top-view) of the RIE-textured, nanostructured Si surface.

Nanostructures are fabricated by reactive ion etching (RIE) using SF₆ and O₂ ions.

The resulting Si surface is black and anti-reflective.

Weighted (AM1.5) average reflectance of RIE-textured mono-, multi- and quasi-mono Si surfaces, respectively.

Damage Removal Etch

Reflectance and minority carrier lifetime as function of damage removal etch (DRE) time in 5% TMAH. Reflectance is kept below 1% for the first ~30s of etching.

POCl₃ Emitter Diffusion

Weighted (AM1.5) average reflectance before and after emitter diffusion (150 Ω/sq.) for mono-crystalline Si with slightly different nanostructure texturing.

Varying incident angle

Weighted average reflectance as function of incident angle for a KOH-textured (squares) and RIE-textured (triangles) mono-cr Si substrates.

Carrier Lifetime

Minority carrier lifetime of RIE-textured Si wafers and a non-textured reference with and without PECVD SiN_x:H AR-coating, respectively. The measurement shows significant decrease in carrier lifetime if no SiN_x:H coating is applied. Furthermore, RIE-textured Si without emitter doping has carrier lifetime too low to be measured. The result confirms the need for passivation of RIE-textured cells.

Electrical Results:

	Total Carrier Loss	Emitter recombination
KOH	1.385 mA/cm ²	0.761 mA/cm ²
RIE	4.163 mA/cm ²	3.322 mA/cm ²

Calculated total carrier loss and carrier loss due to emitter recombination for the KOH- and RIE-textured cell.

	PCE [%]	J _{sc} [mA/cm ²]	V _{oc} [V]	FF	R _{av} [%]
KOH	17.6	36.8	0.62	77.8	2-3
RIE, type 1	15.7	35.3	0.61	72.8	2.85
RIE, type 2	16.5	35.2	0.61	77.7	2.20

PV performance results including power conversion efficiency, PCE, short-circuit current, J_{sc}, open-circuit voltage, V_{oc}, fill factor, FF and weighted average reflectance after emitter diffusion, R_{av} of the RIE- and KOH-textured cells.

Internal Quantum Efficiency of two different black Si cells and three KOH-textured reference cells. Loss in short-wavelength IQE indicates surface recombination.

Proposed Industrial Application:

RIE proposed as alternative to conventional KOH- and acidic texturing step in industrial solar cell production
