Food, Energy, Water, Climate Nexus: Potential in Cameroon

Emmanuel Ackom, PhD

GNESD

UNEP Risø Centre

DTU Management Engineering

Nexus 2014 - Water, Food, Climate and Energy Conference
7th March, 2014, Chapel Hill, North Carolina.

Outline of today's presentation

Background on the GNESD Network (facilitated by UNEP)

Food, Energy, Water, Climate Nexus: Potential in Cameroon

- Food production
- Bioelectricity production potential from agricultural residues (20% use)
- Water savings (potential) relative to the use of crude oil electricity
- GHG emissions reduction potential relative to the use of crude oil electricity
- Concluding comments
- Acknowledging our donors/sponsors

What is GNESD?

GNESD:

launched at the World Summit on Sustainable Development
(2002)

is a global knowledge network involving 10 Centres of Excellence
and Network Partners.

Objectives of GNESD:

Knowledge network

Policy analysis on environmentally benign energy systems and services that:

- can help achieve Millennium Development Goals
- are not harmful to human health;
- do not conflict with our food supply;
- result in poverty alleviation and
- achieving sustainable development in member countries

Centres of Excellence from developing countries

- Energy Research Centre, Univ. of Cape Town, (South Africa)
- AFREPREN (Kenya)
- ENDA-TM(Senegal)
- Mediterranean Renewable Energy Centre MEDREC (Tunisia)
- Asian Institute of Technology (Thailand)
- TERI (India)
- Energy Research Institute (China)
- Fundación Bariloche (Argentina)
- CENBIO/Univ. of São Paulo & CENTROCLIMA/Fed. Univ. of Rio de Janeiro (Brazil)
- Molina Centre on Energy and Environment, Mexico

How GNESD works ...

- Network Centres cooperate through activity based working groups
- Multi-regional (or country) efforts and cross learning
- Annual assemblies, teleconferences etc
- A steering committee provides strategic direction and oversight
- Management structure
- UNEP affiliated secretariat based in Denmark

^e World Agroforestry Centre Regional Office, PO Box 16317, Yaoundé, Cameroon

H I G H L I G H T S

- Environmentally benign residues amount to 1.11×10^6 bone dry tonnes per annum.
- 0.12–0.32 billion litres of bio ethanol annually to displace 18–48% national gasoline use.
- 0.08–0.22 billion litres of biomass to BTL diesel per year to offset 17–45% of diesel use.
- 0.76–2.02 TW h of electricity, representing 15–38% of Cameroon's consumption.
- Residues could offset only 3% of national consumption of traditional biomass.

Food, Energy, Water, Climate Nexus: Potential in Cameroon

- Food production
- Bioelectricity production potential from agricultural residues (20% use)
- Water savings (potential) relative to the use of crude oil electricity
- GHG emissions reduction potential relative to the use of crude oil electricity
- Concluding comments

Cameroon:

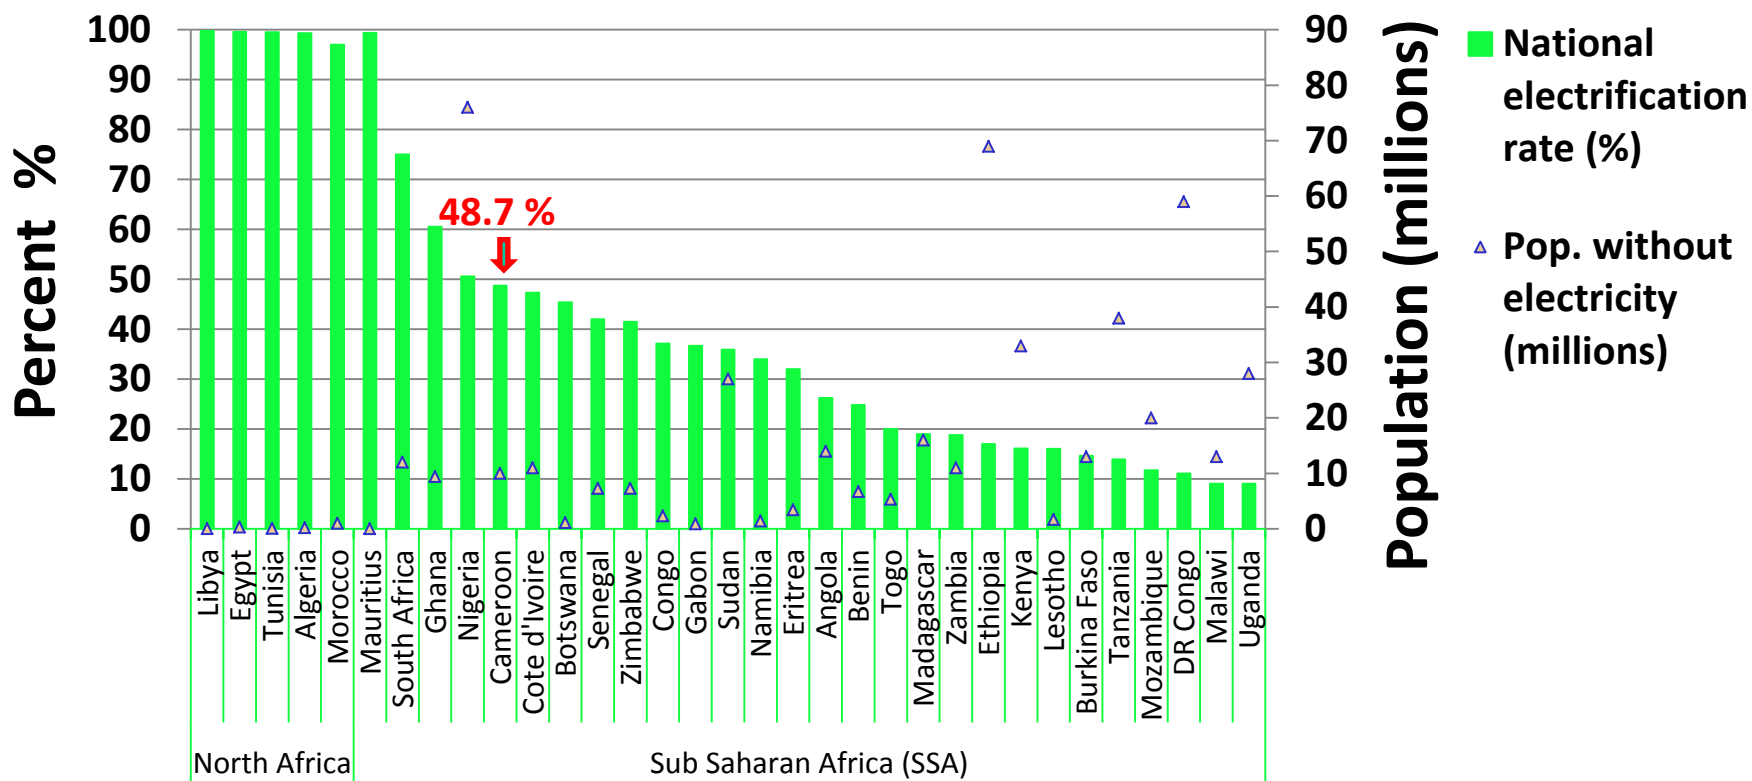

Map source: www.cigarinspector.com

- Total area of 475 440 km²
- 3 times the size of North Carolina
- 1/21 times size of USA

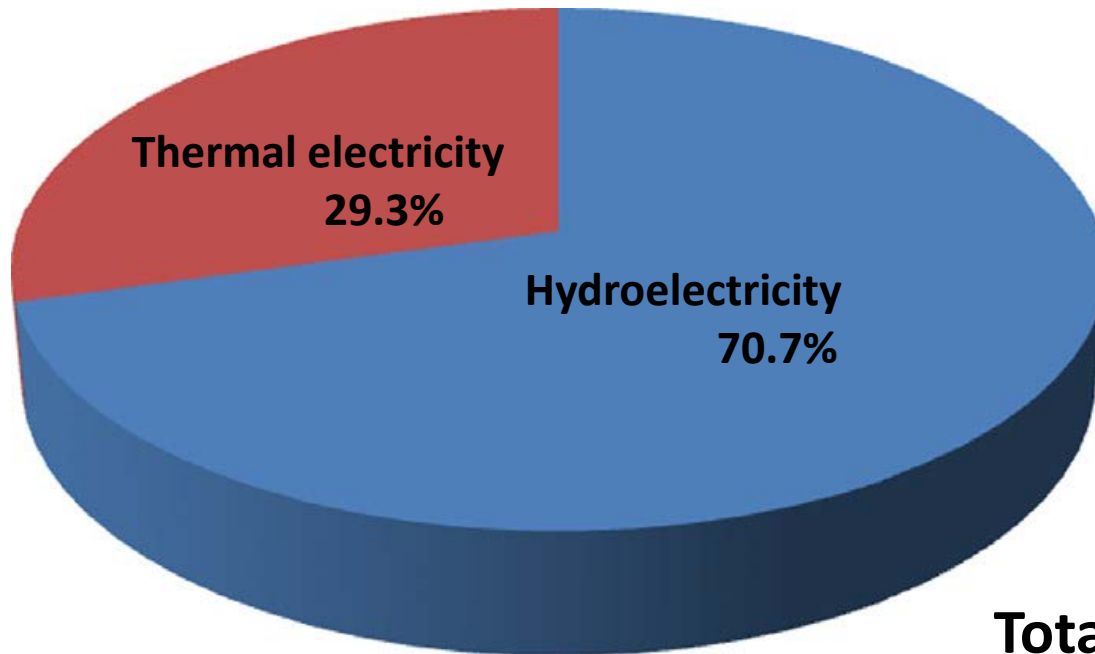

Cameroon: Electricity Access = 48.7 % population (in)accessibility = 51.3% population

Source: IEA, 2009

Current Electricity Generation:

Total: 1016 MW

Agricultural crop residues	Production (tons)	Residue type	Residue to product ratio (RPR)	Moisture content (%)	Lower heating Value (MJ/kg)	Residue (wet tons)	Residue (bone dry tons)	Residue, 20% sustainable extraction (bone dry tons)	Energy Potential (bone dry tons X MJ/kg) GJ	MW h, (GJ × 0.28 × efficiency)	
										15% efficiency	40% efficiency
Units	(tons)	n/a	n/a	(%)	(MJ/kg)	(wet tons)	(bone dry tons)	(bone dry tons)	GJ	MW h (Low)	MW h (High)
Maize	1.67E+06	Stalk	1.5	15	15.48	2.51E+06	2.13E+06	4.27E+05	6.61E+06	2.78E+05	7.40E+05

Sub-total	4.59E+06							9.92E+05		6.66E+05	1.78E+06

Food

Energy

^a Agricultural crop production based on year 2010 statistics information (FAOSTAT, 2012).

^c Residue to product ratio (RPR) was based on published information (OECD/IEA, 2010), except for industrial roundwood RPR.

^e Lower heating values were based on published information (NREL, 2008), except for wheat, industrial roundwood and sawnwood.

^f Lower heating values on wheat were based on published information (Maas et al., 2008).

^h Decentralized bioelectricity generation method, based on Mendu et al., 2012.

Energy potential (bioelectricity) from residues:

- ***Best case:
33% of national electricity consumption***
- ***Least case:
13% of national electricity consumption***
- ***Residues could essentially power most farming communities at decentralized power system scales***

GHG emission reduction potential (bioelectricity) from residues - (reference to crude oil powered electricity)

- ***Best case:
1.7 Mt CO₂***
- ***Least case:
0.6 Mt CO₂***

Water: Estimated 2 to 8 billion litres/year potential savings

Source: www.ewb-dc.org

Conclusion

- *Bioelectricity from agricultural residues exhibit good food-energy-water-climate nexus*
- *Extending electricity access should not always be about long transmission lines but decentralized systems could play key roles especially in rural farming areas*
- *The knowledge could possibly help inform decision makers regarding the good potential of residues for social and environmentally benign development*

Acknowledgement – donor gov'ts/organizations

GNESD secretariat wish to thank:

- Government of Germany;
- Government of Denmark;
- Government of France;
- Government of Italy;
- Government of the United Kingdom;
- UN Foundation;
- UNDP (supported Energy Access activities & outreach activities in the RET theme)
- UNEP

THANK YOU
