

Pattern formation in annular systems of repulsive particles - DTU Orbit (08/11/2017)

Pattern formation in annular systems of repulsive particles

General particle models with symmetric and asymmetric repulsion are studied and investigated for finite-range and exponential interaction in an annulus. In the symmetric case transitions from one- to multi-lane behavior including multistability are observed for varying particle density and for a varying curvature with fixed density. Hence, the system cannot be approximated by a periodic channel. In the asymmetric case, which is important in pedestrian dynamics, we reveal an inhomogeneous new phase, a traveling wave reminiscent of peristaltic motion.

General information

State: Published

Organisations: Department of Applied Mathematics and Computer Science , Dynamical Systems, Department of Physics, Bogolyubov Institute for Theoretical Physics

Authors: Marschler, C. (Intern), Starke, J. (Intern), Sørensen, M. P. (Intern), Gaididei, Y. B. (Ekstern), Christiansen, P. L. (Intern)

Pages: 166-170

Publication date: 2016

Main Research Area: Technical/natural sciences

Publication information

Journal: Physics Letters. Section A: General, Atomic and Solid State Physics

Volume: 380

Issue number: 1-2

ISSN (Print): 0375-9601
