

Spatial filtering velocimetry for real-time measurements of speckle dynamics due to out-of-plane motion. - DTU Orbit (08/11/2017)

Spatial filtering velocimetry for real-time measurements of speckle dynamics due to out-of-plane motion.

This paper describes an optical spatial filtering velocimetry technique that converts an expanding or contracting speckle pattern into a photocurrent. This photocurrent will have a quasi-sinusoidal dependency on this specific speckle motion. The spatial filter consists of a series of concentric rings. Each ring divides the incoming light into two radial-wise, almost even contributions and directs them by refraction toward two half-rings of photodetectors. The corresponding two photocurrents are balanced and provide a differential photocurrent. In this paper the optical spatial filtering velocimetry technique is used to demonstrate real-time measurements of speckle dynamics due to out-of-plane motion.

General information

State: Published

Organisations: Department of Photonics Engineering, Optical Sensor Technology

Authors: Olesen, A. S. (Intern), Jakobsen, M. L. (Intern)

Pages: 3858-3865

Publication date: 2016

Main Research Area: Technical/natural sciences

Publication information

Journal: Applied Optics

Volume: 55

Issue number: 14

ISSN (Print): 1559-128X
